SOME EVIDENCE SUGGESTING THE PERCEPTION OF MODERATE-INTENSITY RADIATION AMONG ALBINO RATS, by Loren C. Logie, W. Lynn Brown (Radiobiological Lab., U. of Texas) and others.
Sep 59, 6p. 3 refs. Rept. 60-5.
Order from LC mi$1.80, ph$1.80 PB 146 147

Two experiments designed to test the hypothesis that albino rats perceive x-radiation as a noxious stimulus are reported. Each experiment involved two conditions which were exactly alike except for the location of a protective lead shield. For half of the Ss, the lead shield was located in front of the right-hand compartment of the shuttle-boxes; for the other half, the lead shield was located in front of the left-hand compartment. In each experiment the results suggested that radiation, or its immediate consequence, was perceived by the rats; however, in each experiment the observed effect was very moderate. (Author)

RADIATION AND SUSCEPTIBILITY TO INFECTION: A LITERATURE SURVEY, by Robert D. Boche.
Special rept. on Contract AF 33(038)27353. [1954]
67p. 269 refs. AD-108 849.
Order from LC mi$3.90, ph$10.80 PB 146 480

Radiation exposure of animals with amounts of ionizing radiations in the LD-50 range produces radiation illness and death characterized by invasion of the bloodstream and tissues by bacteria from the intestine. The mechanism by which the bacteria invade the blood stream is unknown. The organisms recovered from irradiated animals are found to be those characteristic of the species. Latent infections are activated by radiation and the rate of spread of infections is increased by irradiation. Human exposures are often characterized by infectious processes after the second week post-irradiation, a fact in agreement with animal experience. The susceptibility of laboratory animals to induced infection is usually increased by moderate or large doses of radiation. Radiation decreases the cellular elements of the blood and in mice the depression of the white blood cell count like that of the resistance has been found to be exponentially related to radiation dose. Increase in phagocytosis by leukocytes of the blood and by the cells of the liver and spleen is observed after radiation. Destruction of lymphocytes by x-radiation does not increase antibody content of the blood or lymph. Antibiotics reduce both the incidence of infection and the mortality in laboratory animals given radiation exposure providing the invading organisms are susceptible to the antibiotic. The localization of the effect of radiation exposure on antibody production to within a few hours of antigen administration is a notable advance in our knowledge of the immune process.

COLOR REACTIONS FOR INORGANIC ANALYSIS, by Philip W. West. Final rept. on Contract DA 01-009-ORD-460. 1 Mar 59, 51p. 5 refs. OOR rept. 350.15C; AD-213 326.
Order from OTS $1.50 PB 161 544

A variety of color reactions have been studied for inorganic analysis. The studies were directed along two different lines. One phase of the research program was directed toward the development of color reactions that could be applied to nonaqueous systems, especially those associated with solvent extraction separations. The second phase of the program dealt with general studies of colorimetric analysis. Two contributions of special interest have resulted from the program. One is the development of a rapid, simple and reliable scheme for the microanalysis of complex mixtures using only a single drop of solution. The scheme permits the separation and identification of over thirty ions in total time of approximately thirty to forty minutes. The second major contribution has been the development of a highly selective and accurate direct spectrophotometric method for the estimation of chloride. The method is more accurate than any known titrimetric procedure for small amounts of chloride and is free from interferences, even from other halides.

THE BEHAVIOR OF SOME NIOBIUM(V)-HALIDE COMPLEXES IN AQUEOUS MEDIA, by James H. Kanzelmeyer, B. M. Procter, and Patricia Mack. Final rept. on Contract Nonr-1839(00). 27 May 59, 53p. 6 refs.
Order from LC mi$3.60, ph$9.30 PB 145 745

Evidence has been presented that conflicts with the previously accepted $NbOF_5^{=}$ ions postulated for potassium fluoniobate. This salt, dissolved in water, acts as a moderately strong acid reacting with four hydroxides per niobium to form a soluble niobate, a reaction which appears to be both reversible and rapid. A structure has been proposed that takes into consideration these observations and also accounts for the measured conductance of the solutions. The ionic structure consists of two niobium (V) atoms held together by an oxo linkage. Each niobium is covalently linked to five fluorides and one hydroxyl. Eight of the fluorides are comparatively labile, but one on each niobium is hydrogen-bonded to the hydroxyl on the other niobium. (Author)

UREA INCLUSION COMPOUNDS OF ACETYLENE DERIVATIVES, by Jack Radell, Joseph W. Connolly, and Louis D. Yuhas. Feb 60, 13p. 11 refs. WADC Technical rept. 59-672.
Order from OTS $0.50 PB 161 686

Urea inclusion compounds of several acetylene derivatives have been prepared. In the monalkyl and dialkyl acetylenes, the effect of the acetylene group increased the over-all cross-sectional diameter of the molecule. The ability of the acetylenic molecules to form a urea inclusion compound is a function of the number of consecutive $-CH_2-$groups and the over-all cross-sectional diameter of the molecule. The relative stability of the urea inclusion compounds of a series of position isomers of nonyne or decyne depends on the cross-sectional diameter of the molecule. (Author)

THE THERMAL DECOMPOSITION OF 2, 2'-AZOISOBUTANE, by Joseph B. Levy and B. K. W. Copeland. Rept. on Contract AF 49(638)483. Jan 60, 19p. 17 refs. AFOSR-TN-60-161; AD-232 818.
Order from LC mi$2.40, ph$3.30 PB 145 838

The thermal decomposition of gaseous 2, 2'-azoisobutane has been studied over the temperature range 180-220°. The principal reaction products were isobutane and nitrogen. Mirror removal experiments were carried out with antimony mirrors and the lifetime of the t-butyl radical determined. The radical was found to have a substantially longer life than methyl radical. The significance of these results is discussed and a mechanism for the reaction proposed.

MONKEY B VIRUS: A REVIEW OF THE LITERATURE, by William T. Soper. Aug 59, 26p. 35 refs. BWL Technical Study 17. AD-229 993.
Order from LC mi$2.70, ph$4.80 PB 145 874

The content of this report deals with the original observations of Dr. Albert Sabin on infection of man with B virus and continues with accounts of other known infections. Diagnostic methods for isolation and identification of the virus in monkeys and man are included. The growth and action of the virus in various host tissues and it's physical and chemical properties are discussed.

Karolinska Institutet, Stockholm (Sweden).
CONTINUED STUDIES ON THE INFLUENCE OF CULTIVATION TECHNIQUES ON THE ANTIGENIC CHARACTER OF BACTERIA, by C. -G. Heden. Final technical rept. for Nov 58-Nov 59 on Contract DA 91-591-EUC-947-01-1058-59. [1959] 24p. 18 refs. AD-231 369.
Order from LC mi$2.70, ph$4.80 PB 146 205

H. pertussis was grown under pilot plant conditions and the cells were broken up and extracted. The two basic fractions were the soluble components obtained by extraction and the sedimentable portion which proved to consist of cellwalls which could be tested in the form of a lyophilic colloid. The extract contained both a neurotoxic and a dermatonecrotic component which could be roughly separated by physicochemical techniques. None of the nucleic acid or protein fractions isolated from the bacterial extracts were immunogenic. On the other hand the sedimentable portion proved to be an excellent immunogen with almost no toxicity. It is unfortunate that the immunogen of H. pertussis to such a large extent is associated with, or identical with cellwall fragments. A fact which makes the originally planned study of the yields as a function of the growth phase difficult or impossible to perform.

Parke, Davis and Co., Detroit, Mich.
INVESTIGATION OF COMBINED BACTERIAL VACCINES AND TOXOIDS, by H. B. Devlin, Ida Nemer, and Betty Carpenter. Final rept. for 20 May 55-28 Feb 58. [1958] 53p. 35 refs. AD-200 842.
Order from LC mi$3.60, ph$9.30 PB 145 828

The work was to determine whether it was immunologically practical to combine a large number of bacterial vaccines and toxoids in one preparation for inoculation of man. Small laboratory animals were suggested for these preliminary experiments in which an attempt would be made to combine a minimum of five and a maximum of ten antigens. The scope of work included the study of "non-biological" adjuvants such as aluminum gels and mineral oil to improve the protective capacity of the product. Immunogenic activities were to be compared by determining the titers of antibodies produced in the serum or the degree of protection conferred against a toxic or infectious challenge. The results of the work are given.

Avco Corp., Wilmington, Mass.
STUDY OF TECHNIQUE FOR DIAGNOSING EARLY PROGRESSIVE PULMONARY DISEASE: FINAL REPORT. 21 Dec 59, 49p. Technical rept. RAD-TR-59-38.
Order from LC mi$3.30, ph$7.80 PB 145 827

The results of a study to determine the feasibility of correlating respiratory sounds with pathological changes in the lungs by means of analysis of the frequency and amplitude variances during respiration are presented.

Cologne U. (Germany).
SELFINTOXICATION OF THE ORGANISM IN (ADVANCED) RENAL AND HEPATIC INSUFFICIENCY, by Fr. Franzen. Annual rept. (Final technical) for 1 Aug 57-31 Aug 59 on Contract DA 91-508-EUC-252. [1959] 185p. AD-230 072.
Order from LC mi$8.40, ph$28.80 PB 146 198

The following investigations were carried out: (1) the influence of body-own proteinogenic amines on the renal function, tested by means of the clearance method on dogs: (2) clearance of electrolytes (Na, K, and Cl); (3) the influence of body-own proteinogenic amines on the renal function tested in diuresis experiments on hydrated rats; (4) the influence of body-own proteinogenic amines on the diuresis of rats after previous gift of an aminoxydase-blocker (Iproniacid); (5) determination of proteinogenic amines in blood and urine of patients suffering from renal and hepatic diseases; (6) the influence of body-own proteinogenic amines on change of gas, body-weight, blood-sugar, and body temperature of rats and rabbits, respectively.

THE LABORATORY PRODUCTION OF GONYAULAX CATANELLA POISON, by Lloyd H. Graf, Mabel J. Thacher, and Carl R. Brewer. Rept. for Apr 51-Mar 52. 6 Nov 52, 44p. 4 refs. Special rept. no. 174.
Order from LC mi$3.30, ph$7.80 PB 145 875

The investigations described in this report were under taken with the objective of providing a reliable source of G catanella poison in order that chemical characterization might proceed without interruption caused by failure of the natural sources. Attempts were made to increase poison yields by systematic studies on nutrition and incubation conditions affecting G catanella.

Army Chemical Warfare Labs., Army Chemical Center, Md.
EFFECTS OF STRUCTURAL VARIATIONS IN SYSTOX AND ISOSYSTOX ANALOGS ON THEIR REACTIONS WITH CHOLINESTERASE, by Frederick W. Hoffman, James W. King and Harry O. Michel. Rept. for Sep 57-Feb 59. Nov 59, 11p. 9 refs. CWLR-2325, AD-230 382.
Order from LC mi$2.40, ph$3.30 PB 146 251

The effect of variation of the alkoxy group (R') in the series of Systox and Isosystox analogs of the types $(RP(S)(OR')OCH_2CH_2SC_2H_5$ (I) and $RP(O)(OR')SCH_2CH_2SC_2H_5$ (II), respectively, was investigated for the compounds with R being CH_3 and C_2H_5. The thione compounds of type I were prepared by the reaction of the appropriate chloridothioates, $RP(S)(OR')Cl$, with the sodium derivative of 2-ethylthioethanol, and the resulting compounds I isomerized thermally to the thiolo derivatives II. The rates of the inactivation of cholinesterase by I at pH 7.4 and 25° are all small compared to those of the II which show, with increasing chain length of the R' group, increasing velocity constants. (Author)

METHODS FOR QUANTITATIVE DETERMINATION OF GB ABSORBED FROM INSPIRED AIR OF MAN DURING REST AND EXERCISE, by Fred W. Oberst, William S. Koon and James W. Crook. Oct 52, declassified 30 Mar 59, 29p. 9 refs. Medical Labs. Research rept. no. 143.
Order from LC mi$2.70, ph$4.80 PB 146 249

A method was developed for the quantitative determination of GB absorbed from inspired air of man during rest and exercise. A subject inspired orally a known concentration of GB (GB=fluoroisopropoxymethyl phosphine oxide) vapor and exhaled it into a Kel-F bag, the concentration was determined by analysis. The amount of GB retained in the body was calculated. To increase the minute volume of respired air the subject performed work on an ergometer. The amount of GB retained (dosage) for a two minute inhalation period in a man at rest varied between 6 and 13 mmg. During inhalation of a comparable concentration exercise increased the amount retained to 24-82 mmg. (Author)

INFLUENCE OF DIETARY CYSTEINE UPON THE EFFECTS OF CONTINUOUS LOW-LEVEL IRRADIATION, by R. L. Preston and A. Hellman. Rept. on Physiology of Flight. Dec 59, 18p. 15 refs. WADC Technical note 59-190.
Order from OTS $0.50 PB 161 655

Continuous gamma radiation (38.6 and 76.8 roentgens/week given in 8- and 16-hour periods/day, respectively) was administered for 6 weeks to 9 growing rats/radiation level. These were compared to 9 controls. Within these 3 groups, 3 levels of cysteine (0%, 0.4%, and 1.6% of total diet) were individually fed in a factorial experiment to determine if this compound in the daily diet would alleviate the effects of continuous irradiation. Adverse effects on a number of physiological variables caused by the irradiation were not alleviated by the administration of this compound. In fact, certain criteria were affected to a greater degree when the animals were fed the high level of cysteine (reduced body growth, feed consumption and efficiency, and thymus and spleen weights). Albert Einstein Medical Center, Philadelphia, Pa.
THE METABOLISM OF THE RADIATION PROTECTIVE AGENT 2-AMINO-ETHYLISOTHIURONIUM BROMIDE HYDROBROMIDE IN MICE AND ITS ALTERATION BY RADIATION, by Bernard Shapiro. Dec 59, 13p. 8 refs. AFSAM 59-30. AD-231 617.
Order from LC mi$2.40, ph$3.30 PB 146 188

These experiments were designed to separate the various metabolic forms which appear in the mouse after intraperitoneal injection of AET 2-amino-ethylisothiuronium bromide hydrobromide (AET) and to measure the changes in these forms induced by radiation. S-35 labeled AET, paper chromatography, and paper electrophoresis were utilized in making these analyses.

Albert Einstein Medical Center, Philadelphia, Pa.
PROTEIN BINDING OF AET AND ITS ALTERATION BY IONIZING RADIATION, by E. Anne Dickens and Bernard Shapiro. Jan 60, 12p. 7 refs. AFSAM 60-2.
Order from LC mi$2.40, ph$3.30 PB 146 190

Previous reports have described investigations of the behavior of the radiation protective agent, S-(2-aminoethyl) thiuronium bromide hydrobromide (AET) in aqueous buffered solutions (1, 2) and in human serum (3). In aqueous buffered solutions AET underwent transguanylation to form 2-mercaptoethylguanidine (MEG) and its disulfide, guanidoethyl disulfide (GED). In 10^{-3} M solutions of sulfur-35-labeled AET in human serum, 30 to 45 percent of the radioactivity was bound to the serum proteins. The amount of binding did not appear to change appreciably when the serum was allowed to stand at room temperature or when it was exposed to a dose of 240,000 rep from a cobalt-60 gamma ray source. After doses of 1,000,000 rep, however, it was noted that the amount of radioactivity bound to the serum proteins increased. Since radiation protection may be effected by a protein-bound form of the protective agent (4, 5), it seemed that a further investigation of protein binding and its alteration by radiation should be made. A detailed study of the interaction between MEG-GED mixtures and various proteins in solution and of the effect of irradiation upon their interaction is herein reported.

Battelle Memorial Inst., Columbus, Ohio.
THE EFFECTS OF RADIATION ON OXYGEN DESIGNED FOR HUMAN CONSUMPTION, by John F Kircher, Justin S. McNulty and others. Rept. on Health Hazards of Materials and Radiation, Contract AF 33(616)5659. Dec 59, 37p. 24 refs. WADC Technical rept. 59-618.
Order from OTS $1.00 PB 161 551

Both liquid and gaseous aviator's breathing oxygen, contained under controlled pressure and temperature in stainless steel vessels, were subjected to gamma irradiation. The rate of ozone formation in liquid oxygen was nearly constant to 5.9×10^8 ergs $g.^{-1}$(C), the maximum dose used in these studies. Ozone formed during irradiation of gaseous oxygen, reached a maximum concentration at about 3×10^7 ergs $g.^{-1}$(C) and decreased to an equilibrium concentration at about 10^9 ergs $g.^{-1}$(C). The ozone yield appeared to be independent of pressure and dependent upon temperature and dose rate. There were marked increases in the ozone yield with decreasing temperature and with increasing dose rate. In mixed-field irradiations, induced radioactivity due to argon-41 was found. The equilibrium activity was 10 to 14×10^{-5} microcuries per c.c. (Author)

ARYLSILANES AND AROMATIC REACTIVITY, by J. A. Sperry. Annual technical rept. for 1 Jan-31 Dec 59 on Contract DA 91-591-EUC-1024. [1960] 10p. 43 refs.
Order from LC mi$1.80, ph$1.80 PB 145 953

Trimethylsilyl derivatives (mainly new) of benzothiophene, dibenzothiophene, dibenzofuran, N-ethylcarbazole, diphenyl ether diphenylsulphide, diphenylmethane, fluorene, and pyrene have been prepared and studied.

Louisiana Polytechnic Inst. [Ruston.]
THE RLi-INDUCED RING CLOSURE OF TRITYL METHYL ETHER, by J. W. Morton, Jr., W. C. Culp and others. Final rept. for 23 Oct 57-22 Oct 59 on Contract DA 01-009-ORD-585. [1959] 23p. 7 refs. OOR rept. no. 1895. 1-C; AD-231 797.
Order from LC mi$2.70, ph$4.80 PB 145 905

Two mechanisms for the reaction of trityl methyl ether with RLi compounds were investigated in which the reaction yields 9-phenyl-9-fluorenyllithium. In one mechanism, the trityl ether undergoes an ortho metalation, yielding a lithio derivative whose carbanion portion attacks an ortho position of another phenyl group, with the expulsion of methoxide and the formation of a quinoidisomer of 9-phenylfluorene. The latter is then converted into the final lithio derivative by the action of excess RLi. In the second mechanism, the ether, after undergoing ortho metalation, yields a ring closure product, 9-phenyl-9-fluorenyl methylether, by hydride elimination. The fluorenyl ether then yields the final product, either through lateral metalation followed by the elimination of formaldehyde, or through some other mode of reductive cleavage. There is experimental evidence for the ortho metalation which is postulated in both mechanisms. Experimental data agreed well in ruling out the second mechanism as important in the ring closure reaction.

Naval Ordnance Lab., White Oak, Md.
THE TEMPERATURE AND ACTIVATION ENERGY OF ELECTRICAL CONDUCTION IN HIGH POLYMERS, by R. W. Warfield and M. C. Petree. 19 Sep 58, 17p. 19 refs. NAVORD Rept. 6246; AD-212 622.
Order from LC mi$2.40, ph$3.30 PB 145 826

The temperature dependence of the electrical resistivity of a number of high polymers has been determined. By means of an Arrhenius plot, the activation energy for the conduction process in these polymers has been calculated and the results have been interpreted in terms of an ionic diffusion process. The activation energy for the conduction process appears to be a very sensitive index of the extent of polymerization. (Author)

IRRADIATION "FACTOR-DEPENDENCY": SOME VINYL MONOMERS, by Ed. F. Degering, G. J. Caldarella, and M. Mancini. Dec 59, 42p. 5 refs. Radiation Chemistry Lab. Series Research rept. no. 2.
Order from LC mi$3.30, ph$7.80 PB 145 895

Data are given which confirm the observations on the irradiation-induced polymerization of styrene, with respect to the effect of various combinations of parameters. The formulation of Polymerization Rate = $kI^{1/2}$, is not applicable to the dose rates encountered with a 1.5 Mev or higher electron accelerator. The E-value (modified "G_e"-value), or the amount of polymer formation per unit of irradiation energy, increases significantly with a decrease in dose rate down to some optimum value. There is a non-additivity of dose, that is, five exposures at a given dose rate is not equivalent to five times the effect obtained by one exposure at the same dose rate. There is, in certain monomer systems, an "apparent" variation of effects as a function of irradiation parameters, that is, a graph approximating a sloping sinusoidal-type of curve may be obtained for acrylonitrile at least if the per cent yield of polymer is plotted as a function of total dose, provided the points represent also increasing dose rates. Irradiation-induced polymerization-rate has no apparent significance except for a very specifically defined set of irradiation parameters. The results suggest the need

for both extensive and intensive fundamental research in other areas dealing with the applications of ionizing radiation in order to define more accurately the significance of irradiation parameters.

Schmid, Hermann.
THE MECHANISM OF THE DIAZOTIZATION OF AROMATIC AMINES IN NON AQUEOUS SOLVENTS, by Hermann Schmid. Annual technical rept. for 1 Dec 58-30 Nov 59 on Contract DA 91-591-EUC-1010. [1959] 27p. 37 refs.
Order from LC mi$2.70, ph$4.80 PB 145 955

This investigation has been undertaken in the purpose to throw more light on the reaction of the diazotization of amines in organic solvents.

Textile Research Inst., Princeton, N. J.
AN ANALYSIS AND INTERPRETATION OF POLYMER STRESS RELAXATION DATA, by Richard E. Heitman. Technical rept. no. 18 on Contracts Nonr-09000 and Nonr-09001. May 59, 220p. 57 refs. AD-220 739.
Order from LC mi$9.60, ph$33.30 PB 145 903

The relation between the stress relaxation of a polymer sample, pre-stressed below the yield point, and the diffusivity of the reagent which induces the relaxation was established by (1) proposing a theory for the molecular behavior of polymers during stress relaxation in various media (equations which relate force and polymer properties to time were derived); (2) developing experimental and analytical procedures to provide the information necessary to test the theory; and (3) comparing the results obtained from an experimental investigation of the behavior of drawn nylon when it was relaxed in water with data obtained from independent sources. The theory of polymer behavior predicts that the stress relaxation process can, generally, be interpreted to be the result of a series of component relaxations which may, or may not, be related. A new mathematical method is presented by which longitudinal swelling, force constant decay, and chemical reaction can be separated. A continuation of the mathematical development yielded a relationship between the mass of reagent which has entered a relaxing sample at any time and the force level at that time. This method can only be used to determine the diffusivity within a range of values dependent upon the difference of water concentrations in the fiber between the conditioned and relaxed state.

Università degli Studi di Trieste (Italy)
FURTHER STUDIES ON CHEMICAL BEHAVIOUR AND REACTIVITY OF LABILE METAL-ORGANIC COMPOUNDS. Final technical rept. for 1 Jan-31 Dec 59 on Contract DA 91-591-EUC-1015. Jan 60, 57p. 23 refs.
Order from LC mi$3.60, ph$9.30 PB 145 948

Thermal decomposition of $CuCH_3$ in CH_3OH is studied when $Pb(CH_3)_4$ is present. The infrared spectrum of $2AgCD_3 \cdot AgNO_3$ was obtained and studied. The reactivity of copper-methyl towards foreign substances has been studied.

AN INVESTIGATION OF INTERMETALLIC COMPOUNDS FOR VERY HIGH TEMPERATURE APPLICATIONS, by Robert M. Paine, A. James Stonehouse, and Wallace W. Beaver. Rept. for 13 Mar 56-12 Mar 57 on AEC-ANP Materials Research, Contracts AF 33(616)56-12 and AT(30-1)541. Jan 60, 247p. 603 refs. WADC Technical rept. 59-29, Pt. 1.
Order from OTS $3.50 PB 161 683

Intermetallic compounds from thirty-five binary metallic systems were prepared, fabricated into oxidation-test specimens, and tested for oxidation resistance in dry air at 2300°F. Only high-melting (above 2550°F) compounds were studied. These included aluminides, beryllides, silicides, germanides, and zirconides, as well as numerous miscellaneous compounds. The intermetallic compounds or compositions which are shown to have sufficient oxidation resistance at 2300°F to be potentially useful at this temperature include: $NbAl_3$, $TaAl_3$, $CrBe_2$, $MoBe_{12}$, Nb_2Be_{17}, $NbBe_{12}$, $TaBe_2$, Ta_2Be_{17}, $TaBe_{12}$, $TiBe_2$, $TiBe_{12}$, "WBe_5", $ZrBe_{13}$, Zr_2Be_{17}, Cr_3Si, Ti_5Si_3, "TiSi", $TiSi_2$, and $TaCr_2$. A literature survey of intermetallic compounds is included. (Author)

Calvin Coll., Grand Rapids, Mich.
THE OXIDATION OF THE SILVER ELECTRODE IN ALKALINE SOLUTIONS, by Thedford P. Dirkse. Technical rept. no. 8 on Contract Nonr-1682(01). 1 May 59, 26p. 16 refs.
Order from LC mi$2.70, ph$4.80 PB 145 898

The formation of Ag_2O and AgO was studied by means of constant current and constant potential processes. The efficiency of these oxide formations was determined by measuring the gain in weight of Ag electrodes under various conditions of charge, and the extent of the polarization of these processes was measured by using an interrupted current technique. (Author)

Georgia Inst. of Tech. Engineering Experiment Station, Atlanta.
A STUDY OF THE SOLUBILITY AND RATE OF SOLUTION OF FINE AEROSOL PARTICLES, by Clyde Orr, Jr.; F. Kenneth Hurd and others. Final rept. on Contract AF 19(604)1970. 28 Feb 59, 68p. 9 refs. AFCRC-TN-59-281; AD-232 256.
Order from LC mi$3.90, ph$10.80 PB 145 847

The purpose of this research was (1) to determine equilibrium solubilities for PbI_2 and AgI in water at several temperatures, (2) to investigate the rate of dissolution of the same compounds under laboratory conditions, and (3) to determine if the experimental results could have been predicted from previously existing physical data.

Guggenheim Jet Propulsion Center, Calif. Inst. of Tech., Pasadena.
RADIANT ENERGY TRANSFER FROM NONISOTHERMAL MOLECULAR EMITTERS WITH NONOVERLAPPING DISPERSION LINES, by D. Olfe. Technical rept. no. 31 on Contract Nonr-220(03). Apr 59, 16p. 4 refs. AD-218 331.
Order from LC mi$2.40, ph$3.30 PB 145 941

This study on non-overlapping dispersion lines complements earlier work done on overlapping lines and on randomly distributed dispersion lines. Starting with the general relation for the radiant energy flux from a nonisothermal gas, the transparent gas approximation is described for gases of small optical depth. Next the square root approximation is worked out for gases of large optical depth. The result for large optical depths applies provided the temperature gradient in the slab of gas nearest to the observer is not too large. The square root approximation was also used to derive an explicit expression for the radiant energy flux from two adjacent isothermal regions with the hotter gases viewed through the gases which are at lower temperature. COMBUSTION IN LAMINAR MIXING REGIONS AND BOUNDARY LAYERS, by Donald Allen Dooley, Doctoral thesis. Rept. on Contract DA 04-495-ORD-18. 1 June 56, 264p. 79 refs. Memo. no. 20-151; AD-153 464.
Order from LC mi$11.10, ph$41.10 PB 145 888

The governing relations for gaseous flow systems with chemical reaction are briefly discussed. One-step unopposed, "global" reactions following first-order, second-order, and third-order kinetics are considered. The analytic techniques developed are applied to the problems of combustion within laminar mixing regions and boundary layers. The application of the similarity techniques to the problem of chemical reaction within a hypersonic boundary layer is briefly discussed in an Appendix.

Linfield Research Inst., McMinnville, Oreg.
RESEARCH ON ELECTROLYTIC MICROMACHINING TECHNIQUES OF REFRACTORY METALS FOR USE IN FIELD EMISSION DEVICES, by H. W. Pitman and D. C. Hamby. Quarterly progress rept. no. 3, 15 Jan-15 Apr 59, on Contract DA 36-039-sc-78191. [1959] 34p. 7 refs.
Order from LC mi$3.00, ph$6.30 PB 146 496

Evaluation of methods for determining the thickness of thin anodically formed oxide films on tungsten metal has led to the conclusion that the combined use of the coulometric and reflectance methods will yield the most accurate information on film thickness and forming fields. An approach to the calculation of the properties of anodically formed oxide films from coulometric and optical interference data is presented. (See also PB 142 704)

Lockheed Aircraft Corp., Sunnyvale, Calif.
ABSORPTION COEFFICIENTS OF AIR, by R. E. Meyerott, J. Sokoloff and R. A. Nicholls (U. of Western Ontario). Rept. on Contract AF 19(604)3893. Sep 59, 96p. 59 refs. LMSD-288052.
Order from LC mi$5.40, ph$15.30 PB 145 648

Tables of integrated absorption coefficients have been evaluated for high-temperature air by summation of the contributions from certain discrete and continuous transitions. The tables have been computed for dry air in the temperature range from 1,000°K to 12,000°K, at equal energy increments of 0.25 ev (2,016.5 cm^{-1}), in the wavelength range from 1,167 Å to 19,837 Å, and for density ratios relative to sea level, ρ/ρ_o, at each order of magnitude from 10 to 10^{-6}.

Lockheed Aircraft Corp., Sunnyvale, Calif.
ABSORPTION COEFFICIENTS OF AIR, by R. K. M. Landshoff and D. E. Buttrey. Final summary rept. on Contract AF 19(604)3893. Oct 59, 10p. 4 refs. LMSD-288070; AFCRC-TR-59-296; AD-231 436.
Order from LC mi$1.80, ph$1.80 PB 145 647

Tables of integrated absorption coefficients have been evaluated for high temperature air by studying various transitions involving a series of gaseous molecules and ions including the following: NO, O_2, N_2, N_2^+, N^-, N, and O. Temperature range studies covered 1,000°K to 12,000°K. A supplement continues a summation or research on the study of the absorption coefficients of hot gases for the analysis of nuclear fire balls and other high temperature sources.

Massachusetts U., Amherst.
THE POLARIZABILITY OF POLYPROPYLENE, by Daniel A. Keedy, Joseph Powers, and Richard S. Stein. Technical rept. no. 10 on Contract Nonr-2151(00). 28 May 59, 14p. 4 refs. AD-225 439.
Order from LC mi$2.40, ph$3.30 PB 145 747

Theoretical calculations are shown for the polarizability of a unit chain of isotactic polypropylene and for its refractive index and birefringence. The experimental evidence supports the use of Denbigh's bond polarizabilities (Trans. Faraday Soc. 36:936 1940) for the birefringence calculation of polypropylene. The measured birefringence of 40 to 70% crystalline polypropylene ranged from 20 to 30·10^{-3} birefringence units.

Northwestern U. [Evanston, Ill.]
BRIDGED MECHANISM FOR THE PLATINUM(II) CATALYSIS OF CHLORIDE EXCHANGE IN CHLOROAMMINEPLATINUM(IV) COMPLEXES, by Melvin L. Morris, Fred Basolo, and Ralph G. Pearson. Rept. on Contract AF 49(638)315. 20 Nov 59, 30p. 23 refs. AFOSR-TN-59-1225.
Order from LC mi$2.70, ph$4.80 PB 145 844

A kinetic study was made of the platinum(II) catalyzed chloride ion exchange of various chloroammineplatinum(IV) complexes. The exchange was observed to follow the rate law $R = k[Pt(IV)][Pt(II)][Cl^-]$ and to be essentially the same as the rate of platinum exchange. The rate of chloride exchange with trans-$Pt(NH_3)_4Cl_2^{2+}$ is about 2,000 times faster than with the cis isomer and about 10,000 times faster than with $Pt(NH_3)_5Cl^{3+}$. There is no chloride exchange in the system trans-Pt(tetrameen)$_2Cl_2^{2+}$ - Pt(tetrameen)$_2^{2+}$ - $^*Cl^-$. All of these observations are explained on the basis of a two electron change redox reaction involving a bridged activated complex. (Author)

Rensselaer Polytechnic Inst., Troy, N. Y.
PHYSICAL PROPERTIES AND CONSTITUTION OF MOLTEN SALTS: ELECTRICAL CONDUCTANCE, TRANSPORT, AND CRYOSCOPY, by Cyril Solomons and George J. Janz. Technical note no. 6 on Contract AF 49(638)50. Dec 57, 94p. 278 refs. AFOSR-TN-58-17; AD-148 056.
Order from LC mi$5.40, ph$15.30 PB 146 521

A review is given of the literature on the theories and experimental techniques of electrical conductance, electrical transport, and cryoscopy of molten salt systems, with particular reference to problems of structure and constitution. (Author)

NUCLEAR MAGNETIC RESONANCE STUDY OF XENON, by R. L. Streever, Jr. and H. Y. Carr. Doctoral thesis. Rept. on Contract AF 18(603)6. 26 Jan 60, 29p. 13 refs. AFOSR-TN-60-106.
Order from LC mi$2.70, ph$4.80 PB 145 840

Thin spin lattice relaxation time T_1 of Xe^{129} has been measured as a function of temperature in the liquid and pressure in the gas.

Stanford Research Inst., Menlo Park, Calif.
THEORETICAL STUDY OF HIGH TEMPERATURE COMPOUNDS: BOND DISSOCIATION ENERGIES, by A. Paul Brady. Technical rept. no. 1 on Contract Nonr-2629(00). 1 June 59, 17p. 48 refs. SRI Project SU-2625.
Order from OTS $0.50 PB 161 546

A table of selected bond energies was constructed, using the latest kinetic and thermodynamic data and, in so far as possible, taking into account the influence of the atoms in the neighborhood of the breaking bond. It was found that the concept of a radical electronegativity is consistent and useful, providing the bond to hydrogen is considered a special case. Using the above concepts, it has been possible to estimate the strengths of a large number of bonds for which there are no experimental data. After a brief discussion of the concept of bond dissociation energies, a table of energies (confined, for the present, to the first two rows of the periodic table), together with an outline of its derivation is presented.

Ultrasonics Research Lab., Western Reserve U., Cleveland, Ohio.
ACOUSTO-ELECTROCHEMICAL EFFECTS IN ELECTRODE SYSTEMS, by Ernest Yeager. Technical rept. no. 22 on Contract Nonr-1439(04). 1 May 59, 3/p. 33 refs. AD-219 279.
Order from LC mi$3.00, ph$6.30 PB 145 899

The mechanisms by which sound waves produce dc and ac periodic and directional changes in the potentials of electrodes are considered. The importance of such phenomena in the study of electrode kinetics is also discussed. Schlieren techniques were used to examine the concentration gradients at both the cathode and the anode during the electrodeposition of Cu in order to obtain more specific information concerning the effects of sound waves on mass transport. Results indicated that the effective thickness of boundary layer was reduced to about 2μ with conventional forced convection and 1μ with ultrasonic waves. Estimates were made of the ratio of the surface concentration of $CuSO_4$ to that in the bulk of the solution (c_e/c_o) as a function of the acoustical intensity on the basis of quantitative interpretation of schlieren negatives. Two mechanisms proposed to explain the decreases in H overvoltage on Pt under conditions where concentration polarization involving the electrolyte should be

negligible were discussed. A kinetic treatment is given for the response of a reversible electrode to pressure and temperature variations. Electrode systems involving several consecutive reactions were considered.

THE LOCAL-AREA SURFACE CHART, ITS PREPARATION AND USE. 29 Jan 60, 82p. 33 refs. Air Weather Service Manual 105-35.
Order from LC mi$4.80, ph$13.80 PB 146 483

This manual includes the suggested plotting procedures, the various techniques recommended to obtain the best analysis and prognosis of the weather in the local area, and the suggested methods for preparing a forecast from the analyzed Local-Area Surface Chart. Some modifications of the chart are presented for occasions where lack of time and personnel deny use of the complete analysis and prognostic procedure. The utilization of facsimile charts in conjunction with the Local-Area Surface Chart is also discussed.

Allied Research Associates, Inc., Boston, Mass.
RADAR PATTERNS AS A FORECAST AID; A CASE STUDY, by Raymond Wexler. Rept. on Contract AF 19(604)3492. 29 May 58, 23p. 6 refs. AFCRC-TN-58-262; AD-152 619.
Order from LC mi$2.70, ph$4.80 PB 146 201

On 2 December 1952, surface weather map indications and a lowering cloud deck threatened imminent snow to the Boston area. However, changing radar echo patterns aloft gave three important clues that precipitation would not be appreciable: (1) The transformation of the upper portion of the echo from a uniform pattern (type 3) to a cellular pattern (type 1) with top at a lower level, indicated advection of dry air aloft and a reduced precipitation rate, (2) A simultaneous cessation of the stalactites at the echo base also indicated a reduced precipitation rate, (3) A remarkably changing wind profile, as determined from the slopes of the trails, indicated advection of warm air tending to stabilize the precipitation forming region near the echo top. Indeed, it turned out that only a trace of snow fell during the succeeding 24-hour period.

Army Signal Research and Development Lab., Fort Monmouth, N. J.
FACTORS INFLUENCING THE USE OF RAWIN SET AN/GMD-2 IN ARTILLERY METEOROLOGICAL SYSTEMS, by William Todd. 22 Aug 58, 20p. 8 refs. USASRDL Technical rept. 1978; AD-205 398.
Order from LC mi$2.40, ph$3.30 PB 139 075

A comparison is made of the operational characteristics of Rawin Sets AN/GMD-1( ) and AN/GMD-2 in determining the winds that exist aloft. The advantages of each system are discussed with respect to use of these sets for obtaining ballistic corrections for artillery. The performance of these systems is compared to a ballistic wind requirement of 1 mph and the inherent limitations of accuracy imposed by the variability of meteorological conditions with space and time as would be experienced in typical army operations. Conclusions indicate that the AN/GMD-1 system provides adequate performance except under conditions of extremely high wind. (Author)

Chicago U., Ill.
AXIAL VELOCITY STREAKS IN THE JET STREAM: AGEOSTROPHIC "INERTIAL" OSCILLATIONS, by Chester W. Newton. Technical rept. no. 2 on National Science Foundation Grant NSF-G6353 and Contract Nonr-2121(10). Apr 59, 28p. 13 refs.
Order from LC mi$2.70, ph$4.80 PB 145 795

An air particle alternately speeds up and slows down, as it passes through local isotach maxima. It is shown that on the average, the observed period of such speed variations in the core of the jet stream is about twice the period of an inertial oscillation. Periods are somewhat longer for mean anticyclonically-curved, and shorter for cyclonically-curved flow. The length of a maximum velocity streak, measured between successive points of minimum speed, is greatest when the average wind speed in the jet axis is large, and is greater at low than at high latitudes, other things being equal. This behavior is consistent with the hypothesis that, for an air particle in the jet core, the geostrophic (or gradient) wind velocity varies at one-half the vector change in the actual wind velocity. Outside the jet core, where periods are longer due to smaller wind speeds, the geostrophic (or gradient) wind more nearly accommodates to changes in the actual wind velocity. (Author)

Coastal Studies Inst., Louisiana State U., Baton Rouge.
INFLUENCE OF HURRICANE AUDREY ON THE COASTAL MARSH OF SOUTHWESTERN LOUISIANA, by J. L. Chamberlain (Randolph-Macon Woman's Coll.). Technical rept. no. 10, Pt. B, on Contract N7onr-35608. 1 June 59, 44p. 14 refs. AD-218426.
Order from LC mi$3.30, ph$7.80 PB 146 482

Four distinct phases of the effects of Hurricane Audrey, which struck the coastal area of southwestern Louisiana on June 27, 1957, were studied: (1) general changes in the marsh environment; (2) soil salinity and marsh plant distribution; (3) distribution of beach vegetation; and (4) descriptions of the mud arcs. The three general changes outlined were climatic, gross physical, and vegetational. It was concluded that the variations in soil salinity may have reflected normal seasonal fluctuations rather than storm-induced changes, since post-hurricane sampling was one month after the storm. Horizontal distributions of the plants on the beach were altered by changes in the beach profile, but are evolving toward a stable zonation which will be accomplished when the beach is in balance with the physical forces. The force of the hurricane carried 2 large masses of clay over the beach and deposited them as units (mud arcs) to eventually become permanent features of the shoreline stratigraphy. They were studied in the light of their physical features and vegetation.

Daniel Guggenheim Airship Inst., Akron, Ohio.
RELATION BETWEEN GUSTS AND AVERAGE WINDS FOR HOUSING LOAD DETERMINATION, by P. O. Huss. Rept. on Contract Cwb-6103. June 46, 117p. 3 refs. DGAI rept. no. 140; AD-118 626.
Order from LC mi$6.00, ph$18.30 PB 146 484

Major interest in this study lay in the ratio (f_w) between the peak velocities (V_i) and the "fastest single mile" velocity (V_w) and, also, in the variation with height of the velocities and the above ratio. The ratio appears to vary statistically at a given height and the variation with height follows an inverse exponential relation, $f_w = kh^{-1/n}$. The variation of the velocity with height is, as has been noted by other investigators, a rather erratic factor, but the usual form $V/V_o = (h/h_o)^{1/n}$ is fairly accurate above the 40 foot level. It appears, however, that this exponent varies also with the probability relationship, the average value being in order of 6.5 for the average velocities and 11 for the peaks.

Johannes Gutenberg-Universität, Mainz (West Germany).
INVESTIGATIONS ON THE HEAT BALANCE OF THE TROPOSPHERE, by Günther Korb, Johannes Michalowsky and Fritz Möller. Technical rept. no. 2 on Contract AF 61(514)1005. Nov 57, 87p. 4 refs. AFCRC-TN-58-238; AD-152 471.
Order from LC mi$4.80, ph$13.80 PB 146 228

The investigation on the tropospheric radiation balance, was centered on giving an easy applicability to the methods developed. A method is proposed for simple determination of tropospheric water vapor content from dew point measurements of the usual radiosonde ascents. A clear representation of short-wave absorption with clouded and cloudless skies is described. It appears that the absorption can be represented in dependence on geographic latitude and total water vapor content for any cloud given. This simple method for determination of short-wave absorption together with the method for determination of long-wave emission, given previously, is used for calculation of the tropospheric radiation balance during July and November 1955. The maps of absorption, emission, and tropospheric radiation balance make it evident that regions of high and of low values can be defined. It can be concluded that regions of high and low values of the tropospheric radiation balance are not formed based on simple relations but result from the complicated coherence of many independent factors.

NUMERICAL INTEGRATION OF THE PRIMITIVE EQUATIONS ON THE HEMISPHERE, by Norman A. Phillips. Technical rept. on Numerical Weather Prediction Project, Contract Nonr-1841(18). June 59,

43p. 17 refs. AD-218 148.
Order from LC mi$3.30, ph$7.80 PB 146 475

A 48-hr forecast for the entire Northern Hemisphere of a barotropic hydrostatic atmosphere is made with the primitive equations. Overlapping Mercator and stereographic grids are used together with the finite-difference scheme. Initial data corresponded to a Haurwitz-type pattern of wave number 4, the initial wind field was non-divergent, and the initial geopotential field satisfied the balance equation. The computations seem to be stable and well-behaved, except for 2 small temporary irregularities. The amplitude of the gravity-inertia waves present in the forecast geopotential field is about 1/30 that of the large-scale field. This is shown to be due to the neglect, in the initial data, of the quasi-geostrophically conditioned divergence field. The computational technique does not give any unreal prominence to the meteorological noise. The computational characteristics and stability criterion of the Eliassen-type finite-difference system are investigated for a linearized version of the equations. This finite-difference system possesses 6 computational frequencies. The extra frequencies arise from the advective terms in the equations of motion. (Author)

HANDBOOK OF YUMA ENVIRONMENT, by Albert H. Jackman. Feb 53, 60p. 11 refs. Environmental Protection Branch rept. no. 200.
Order from LC mi$3.60, ph$9.30 PB 146 815

Heat and drought are the major climatic controls over desert testing in the Yuma Test Area. About one-half the days of the year have maximum temperatures of 90°F. or above, and nearly one-third the days have maximum temperature of 100°F. or over. High temperatures and heat stress problems are most frequent from May through September. Winters (December through February) are cool. The low rainfall of the Yuma region is indicated by its mean annual precipitation of 3.38 inches. Moist air, however, sometimes moves over the region from the Gulf of California bringing fairly high humidities which are particularly noticeable during July and August. Other meteorological factors considered in this report include dew points, wind speeds, and cloud cover. The topographic arrangement or form ranges from low, flat bottomlands with practically no slope gradient to rugged mountain terrain with characteristic gradients of 20 to 45 degrees. Most of the area has a sparse vegetation cover of low shrubs, with growths of small thorny trees in the washes and other drainage channels. The smaller shrubs are generally stiff and woody; certain species of cactus present a special protection problem due to their spines. Only in bottomlands where the water table is near the surface is there a dense shrub or tree growth consisting of mesquite, tamarisk (salt cedar), arrowweed, willows, or cottonwoods. Where there is surface water standing most of the year, as in the river overflow areas, there are dense growths of cattails and other semi-aquatic plants.

Washington U., Seattle.
ON VALLEY AND MOUNTAIN WINDS, by Konrad J. K. Buettner and Norman Thyer. Final rept. on Contract AF 19(604)2289. Sep 59, 30p. 15 refs. AFCRC-TR-59-283; AD-231 495.
Order from LC mi$2.70, ph$4.80 PB 146 193

Air currents were investigated in and above the Carbon River Valley in the northwest corner of Mt. Rainier National Park. Observations were made mostly with pibals; wiresonde, tethered balloons, and airplanes. Preference for investigation was given to clear days, and nights with low geostrophic winds. A permanent wind and radiation station was installed in the more distal part of the valley. A daytime valley wind and a nighttime mountain wind flow quite regularly. These winds fill the valley to nearly ridge level. About 300 m above the ridge level compensation currents or anti-valley and anti-mountain winds begin. All four currents are stronger in the more distal valley. Currents in the valley and their respective anti-winds are separated by a highly irregular mixing layer 200-300 m in thickness. Nighttime winds are quite erratic.

ARDE Associates, Newark, N. J.
ANTENNA FOUNDATION DESIGN STUDY, by M. Scheinberg, B. J. Aleck and others. Rept. on Contract AF 30(602)1872. 30 Sep 59, 513p. 45 refs. ARDE rept. no. 3584-1; RADC-TR-59-251.
Order from LC mi$11.10, ph$78.90 PB 146 493

This report contains the results of a study to devise new types of foundations and to evaluate these as well as existing foundations for extremely large, permanent antennas located in Arctic areas. Novel types of foundations, specifically designed for stability in permafrost soils, are presented. Optimum foundation types for several different antennas and for a number of typical Arctic soil conditions are given. Methods for design of these foundations are presented which provide for long time stability under extreme conditions. (Author)

Army Snow, Ice and Permafrost Research Establishment, Wilmette, Ill.
THE NARROW INFINITE WEDGE ON AN ELASTIC FOUNDATION, by D. E. Nevel. Rept. on Bearing Capacity of Floating Ice Sheet. July 58, 22p. 4 refs. Technical rept. 56; AD-208 019.
Order from LC mi$2.70, ph$4.80 PB 146 499

A solution to the problem is presented to serve as a basis for predicting where and under what conditions a circumferential crack will develop in a floating ice sheet. The solution assumes a wedge angle small

enough that tangential bending can be neglected as well as the absence of lateral forces exerted on the wedge by adjacent wedges. The differential equation describing the problem is:

$$\frac{d^4y}{d\chi^4} + \left(\frac{2}{\chi}\right)\left(\frac{d^3y}{d\chi^3}\right) + y = 0$$

and its solution reads: $y = A\,nev_0(\chi) + B\,nev_1(\chi) + C\,nev_2(\chi) + D\,nel_1(\chi)$, where A, B, C, and D are constants of integration and nev_0, nev_1, nev_2, and nel_1 are functions defined by an infinite series. (Author)

Dartmouth Coll., Hanover, N. H.
CRYSTALLOGRAPHIC ORIENTATION IN LAKE AND ARTIFICIAL ICE, by J. B. Lyons and R. E. Stoiber. Scientific rept. no. 2 on Contract AF 19(604)2159. 31 Oct 59, 20p. 9 refs. AFCRC-TN-59-655.
Order from LC mi$2.40, ph$3.30 PB 146 200

Observations on lake ice and ice frozen experimentally at -10°C under varying conditions of thermal flux and in some cases with a stream of air directed toward the surface lead to the conclusions that ice orientation may best be explained in terms of (1) thermal gradients in the growth medium (water), (2) thickness of the supercooled water layer, (3) mechanical effects such as fragmentation of the earliest-formed ice skim, and (4) more rapid crystallization velocity in the basal plane of ice. The crystallographic fabric of the ice formed under several different experimental conditions is presented in a series of illustrations. (Author)

INTERPRETATION OF LAND UTILIZATION FROM AERIAL PHOTOGRAPHS, by Hans Boesch and Dieter Steiner. Final technical rept. for 1 Nov 58-31 Oct 59 on Contract DA 91-591-EUC-975. 1959, 73p. 70 refs. AD-232 725.
Order from LC mi$4.50, ph$12.30 PB 145 950

Systematic study was made of gray tone, texture, and stereoscopic appearance on panchromatic air photographs, taken at different seasons over different regions of Switzerland. The base material consisted of air photographs taken at different seasons, partly at different day-times. Land-use mapping in the field was carried out shortly after the photographs were taken. The usefulness of gray tone, texture, and stereo-effect for the interpretation and the possibilities of distinguishing different types of land-use were evaluated by means of statistical methods. EVAPORATION FROM THE OCEANS, by W. C. Swinbank. Scientific rept. no. 12 on Contract AF 19(604)2179 and National Science Foundation Grant NSF-G6385. Dec 59, 18p. 10 refs. AFCRC-TN-60-211.
Order from LC mi$2.40, ph$3.30 PB 146 194

The present report by Dr. W. C. Swinbank was prepared to provide an up-to-date formula for computations of the exchange of latent heat between the oceans and the atmosphere. The results of these computations, with special reference to the energy supply of mobile motion systems on the North Atlantic, will be described in separate reports.

Woods Hole Oceanographic Institution, Mass.
OCEANOGRAPHIC DATA FROM THE CARIBBEAN SEA "CRAWFORD" CRUISE 17, FEBRUARY-MARCH 1958 FOR THE INTERNATIONAL GEOPHYSICAL YEAR OF 1957-58, by W. G. Metcalf. Rept. on Contract Nonr-2196(00). Apr 59, 89p. 6 refs. Reference no. 59-9.
Order from LC mi$4.80, ph$13.80 PB 146 245

In the present report, the oceanographic data are presented in a form similar to that used earlier. Four north-south cross sections of the Caribbean Sea were made. Station positions from CRAWFORD Cruise 17 are shown in Figure 1. Also included are the Caribbean stations from the 1954 ATLANTIS cruise. Temperature, salinity and oxygen profiles for each section are presented on a base showing the observation points and the bottom contours in Figures 2 through 19 The tabular data are presented in the same form as those from earlier cruises. The position given is the mean for each station. The GMT is the time at which the messenger was sent for the first (shallow) cast. The Depth is the sonic depth corrected for the speed of sound in sea water according to Matthews' (1939) tables and is rounded off to the nearest five meters. In some instances the bottom bottle tripped on the ocean floor, and the depth has been calculated from paired protected and unprotected reversing thermometers. The BT# is the slide number of the bathythermogram obtained for the station. In most cases, the bathythermograph lowering was made shortly before the ship stopped or shortly after getting underway in connection with each station. Salinities were determined on the Woods Hole Mark II salinometer. Dissolved oxygen determinations were carried out by the Winkler method. Hourly bathythermograph loweringa were made while underway, sea conditions permitting. The tracings of the bathythermographs presented were prepared in the manner described by Fuglister. Below each tracing is given the following information: First line: Slide number G.C.T., Day, Month, Year, Wind Direction (in tens of degrees, True) and Wind Force (Beaufort Scale). Second line: Latitude and Longitude. Third line: Surface (bucket) temperature.

THE DYNAMICS OF ISOTROPIC TURBULENCE IN TWO DIMENSIONS, by W. H. Reid. Technical rept. no. 23 on Contract Nonr-562(07). Apr 59, 25p. 11 refs. 562(07)/23.
Order from LC mi$2.70, ph$4.80 PB 145 796

The dynamical equations which describe the behavior of isotropic turbulence in two dimensions are derived under the assumption that all fourth-order cumulants of the velocity field vanish. Due to the absence of vortex line stretching, the transfer mechanism which developes in this case differs markedly from the usual three-dimensional one. For example, an initial energy distribution in the form of a single line spectrum is found to remain unchanged. More generally, however, there is found to be an almost equal transfer of energy from the medium sized eddies to both smaller and larger eddy sizes. The large magnitude of this 'back-transfer' suggests the need for caution when applying the usual cascade arguments to turbulence in two dimensions. These results would seem to be relevant to the problem of the large-scale motions in atmospheric turbulence which are known to exhibit certain two-dimensional characteristics. (Author) (See also PB 145 799)

STUDIES ON PROPAGATION IN THE IONOSPHERE, by H. G. Booker, B. Nichols and others. Progress rept. no. 3 on Contract DA 36-039-sc-74903. 30 June 58, 33p. 3 refs. Research rept. EE 379; AD-204 119.
Order from LC mi$3.00, ph$6.30 PB 138 117

A critical review has been begun of the various unsolved questions connected with ionospheric turbulence. Equipment that had been prepared for measuring the height of phase scintillations using Sputnik III was put into operation. The results were disapointing, apparently due to low radiated power from Sputnik III. An investigation has been begun of the idea due to Dagg that phase scintillation spread-F could be due to ionospheric turbulence below the F-region. The idea is that turbulence in the E-region might cause irregularities of space charge and hence irregularities of electric field. The IGY auroral radar, operating continuously at 41.0 Mc/s, has been used for a series of new measurements of the decay of long-duration meteor echoes. Figures and tables showing some of the results are presented herewith. (See also PB 135 964)

Cornell U. School of Electrical Engineering, Ithaca, N. Y.
A THEORY OF ELECTROSTATIC FIELDS IN A HORIZONTALLY STRATIFIED IONOSPHERE SUBJECT TO A CONSTANT, VERTICAL MAGNETIC FIELD, by D. T. Farley. Technical rept. no. 52 on Studies on Propagation in the Ionosphere, Contract DA 36-039-sc-74903. 31 Dec 58, 33p. 9 refs. Research rept. EE-397.
Order from LC mi$3.00, ph$6.30 PB 146 165

A theory is developed to describe quantitatively the idea that, in an ionized gas subject to an imposed magnetic field, such as the ionosphere, the lines of magnetic flux are approximately equipotential lines. The analysis indicates that in the ionosphere the results are strongly affected by the variation of conductivity with height, as well as the anisotropy.

VALVE, ANTIBACKDRAFT, E2R2 (FINAL ENGINEERING TEST NO. 117) by Donald F. McFarland, Jr. Oct 59, 46p. CWLR-2314; AD-229 340.
Order from LC mi$3.30, ph$7.80 PB 145 755

This report covers in detail the final engineering test of an antibackdraft valve developed to maintain a constant static pressure in small portable shelters under collective protection. Results of the test program indicated that the valve was essentially satisfactory in filling the design characteristics. (Author)

Northwestern Technological Inst., Evanston, Ill.
A NEW METHOD OF WASTE DISPOSAL FOR ISOLATED SITES IN THE ARCTIC. I. CHEMICAL ADDITIVES AND MECHANICAL HOMOGENIZERS, by John A. Logan. Rept. for 30 Sep-31 Dec 58 on Contract AF 41(657)207. [1958] 19p. Technical note AAL-TN-59-5; AD-230 843.
Order from OTS $0.50 PB 161 540

Chemical additives, homogenizers, oil burners, toilets, oil burners and garbage disposal units are discussed. A preliminary layout for a camp of 50-100 men is attached to the report.

MAN'S ABILITY TO APPLY CERTAIN TORQUES WHILE WEIGHTLESS, by Ernst Dzendolet and John F. Rievley. Apr 59, 33p. 8 refs. WADC Technical rept. 59-94; AD-220 363.
Order from LC mi$3.00, ph$6.30 PB 146 575

The torque that a maintenance man can exert within a space vehicle while weightless, and hence tractionless, is analyzed. Anthropological literature was reviewed to determined the torques a man can apply under normal conditions. Using elementary physical principles the consequences of applying these torques while tractionless were calculated. Certain of the predictions were verified experimentally. It is tentatively concluded that standard anthropometric data can legitimately be extrapolated to the weightless conditions. Suggestions are advanced regarding (a) the optimum body position for a simple tightening task without using a handhold, (b) the use and location of handholds, (c) maximum torque limitations, (d) the use of impulses, and (e) the design of hand tools. (Author)

Armour Research Foundation, Chicago, Ill.
MEASUREMENT OF AIR NAVIGATION ACCURACY ALONG CERTAIN VOR AIRWAYS, by G. W. Bond. Final rept. on Contract FAA/BRD-28. June 59, 131p.
Order from OTS $2.75 PB 161 652

During the winter of 1958-59 a large number of measurements were made, by means of a long-range radar, of the accuracy of air navigation along certain VOR airways within 130 miles of Kansas City. The measurements encompassed a variety of aircraft types and flight conditions, and were made generally without the pilots knowledge. The type, identity, assigned altitude, origin, destination, and reported times over certain VOR station were obtained for each aircraft from air traffic control records. Related weather and winds aloft data were obtained from the weather teletype. The positions of the VOR radials defining the airways in the area were also measured, by means of a specially instrumented aircraft.

Arnold Engineering Development Center [Tullahoma, Tenn.]
AERODYNAMIC LOADS ACTING ON THE CANTILEVERED NOSE SECTION OF THE COLEMAN AJ 10-33 ROCKET SLED AT TRANSONIC AND SUPERSONIC SPEEDS AS DETERMINED BY WIND TUNNEL TESTS, by Benford H. Johnson. Rept. on ARO, Inc. Contract AF 40(600)800. Jan 60, 32p. 2 refs. AEDC-TN-59-167. AD-231 447.
Order from LC mi$3.00, ph$6.30 PB 145 749

Wind tunnel tests were conducted on a 0.0298-scale model of the Coleman AJ 10-33 rocket sled to determine the aerodynamic loads acting on the cantilevered nose section of the model and to determine the rates of change of these loads with deflection of the nose section in pitch and yaw. The tests were performed with the model in the presence of a ground plane at Mach numbers from 0.6 through 2.5. Longitudinal and lateral loads were obtained in the deflection ranges of ± 3.0-deg angle of attack and ± 1.5-deg angle of yaw. Axial-force data were obtained from pressure distribution measurements on the nose section.

Bell Aircraft Corp. [Buffalo, N. Y.]
A STUDY OF VELOCITY-FREQUENCY-DAMPING RELATIONSHIPS FOR WING AND PANEL BINARY SYSTEMS IN HIGH SUPERSONIC FLOW, by Melvin B. Zisfein and Frank J. Frueh. Rept. on Contract AF 49(638)365. Oct 59, 64p. 11 refs. Rept. no. 9015-19-001; AFOSR-TN-59-969; AD-228 774.
Order from LC mi$3.90, ph$10.80 PB 145 978

Initial results are presented of a program to obtain and study analytical relations between flutter and dynamic response. Piston theory aerodynamics was used to study two kinds of binary systems, pitch-plunge wings and 2-degree-of-freedom simply supported panels. A major portion of the effort was focused on the effects of viscous and structural damping on the flutter and dynamic response characteristics and the relations between them.

deFlorez Co., Inc., Englewood Cliffs, N. J.
METHODS OF PRESENTING MOVING OBJECTS IN POINT LIGHT SOURCE VISUAL DISPLAYS. Rept. on Contract Nonr-1628(00). June 59, 68p. 2 refs. Technical rept. NAVTRADEVCEN 1628-5.
Order from LC mi$3.90, ph$10.80 PB 145 932

This report describes the results of an investigation to discover and analyze methods and systems whereby moving objects may be presented in point source projected visual displays. It includes an analysis of the nature of movement in the real world as a frame of reference for movement to be produced in the world of visual displays. A number of methods and systems have been devised which will project moving objects in point source visual displays. However, each system is quite limited in capability and can meet only

a particular and rather narrow range of requirements. None of these systems will produce a completely non-programmed moving object which will be completely realistic as well. In general, it is practicable to provide only one moving object.

Directorate of Flight and All-Weather Testing, Wright-Patterson AFB, Ohio.
OPERATION ANALYSIS TECHNIQUES FOR ESTIMATING THE EFFECT OF DELETING AIRCRAFT ICE PROTECTION SYSTEMS, by James K. Thompson. Sep 59, 14p. 15 refs. WADC Technical note 59-163; AD-216 082.
Order from LC mi$2.40, ph$3.30 PB 146 914

A method is defined for estimating the significance and frequency of encountering various total accumulations of ice on unprotected components during proposed operations. The technique has been evolved over a period of years and reduces available statistics and pertinent theory to practical graphs for use by personnel without previous experience in icing theory. Examples of application to three types of aircraft operations are provided to illustrate use of the technique and the effects of varying aircraft speeds and operational altitudes. (Author)

Goodyear Aircraft Corp., Akron, Ohio.
ROUGH TERRAIN LANDING GEAR EVALUATION PROGRAM, by George Schuck. Rept. on Contract DA 44-177-TC-436. 15 Mar 59, 275p. 10 refs. GER 9244; AD-206 902.
Order from LC mi$11.10, ph$42.60 PB 145 804

This report covers the testing of an L-19A "Bird dog" liaison airplane equipped with Goodyear Terra tires, air wheels and the Standard 700 x 5 tire. The tests were conducted over sand, mud, and simulated rough terrain. The results indicate that the use of large size low pressure tires improves performance over both the sand and mud. The large low pressure tires show indication of greater energy absorption than the standard tires; however, the area of optimum pressure for the large tires appeared to be below the inflation pressure range tested. (Author)

Hiller Aircraft Corp., Palo Alto, Calif.
DYNAMIC STABILITY ANALYSIS OF DUCTED FAN TYPE FLYING PLATFORMS, by R. N. Greenman and M. G. Gaffney. Rept. on Contract Nonr-1357(00), Phase IV. 29 May 59, 164p. 7 refs. Rept. no. ARD-233.
Order from LC mi$7.80, ph$25.80 PB 146 029

An analysis is presented of the longitudinal dynamic stability characteristics in hovering and in level low-speed flight ($\lambda \leq .12$), of the Hiller 7-foot diameter ducted fan flying platform. In addition, several configuration variations were investigated, including duct section and chord, number of propeller blades, propeller blade setting, and clearance between tips of propellers and inside of duct. The equations of motion are developed using standard methods. Time histories, obtained with an analog computer, and the resulting stability parameters are presented graphically. The present gyrobar stabilizer system provides sufficient damping in hovering flight but will not overcome the divergent motion in forward flight. For this reason, the dynamic characteristics deteriorate with increasing speed. This is primarily due to the static (angle-of-attack) instability which occurs at higher speeds. (Author)

Hiller Aircraft Corp., Palo Alto, Calif.
WIND TUNNEL TEST OF SEVERAL DUCTED PROPELLERS IN NON-AXIAL FLOW, by W. J. Gill. Rept. on Contract Nonr-1357(00), Phase IV. 20 Apr 59, 397p. 10 refs. Rept. no. ARD-224.
Order from LC mi$11.10, ph$60.60 PB 146 176

Wind tunnel and static tests were conducted on various ducted propellers of 2.0 foot diameter. Measurements were made of the total aerodynamic forces and moments, the forces and moments acting on the duct itself, and the power supplied to the propellers. The model was tested at advance ratios (tunnel airspeed/propeller tip speed) of 0, 0.05, 0.10 and 0.15 with the duct axis tilted through a range of angles between 0 and 90 degrees. Detailed velocity surveys were conducted in the slipstream, and vanes mounted in the slipstream were tested. In addition, centerbodies of the type used in flying platforms were investigated. Four ducts were tested in combination with three different sets of contra-rotating, adjustable pitch propellers. The data are presented in the form of coefficients based on propeller tip speed, duct area and propeller radius, except for the duct alone (ring wing) data, for which the coefficients are based on tunnel airspeed. Slipstream flow survey data are presented in tabular form.

Kaman Aircraft Corp., Bloomfield, Conn.
KRC-4 ROTOCHUTE DEVELOPMENT, by C. B. Packard. Final rept. on Contract Nonr-901(00). 1 Aug 58, 160p. 10 refs. Rept. no. R-239.
Order from LC mi$7.50, ph$24.30 PB 146 103

The following are summarized: development of a Rotochute design that is ready for service evaluation; development of a tactical prototype vehicle with multiple, interchangeable containers; demonstration of dynamically stable descent at a rate of 53 feet per second for 100-pound payload, and 58 feet per second for 200-pound payload; establishment of a minimum release altitude of 300 feet to develop terminal descent; demonstration of successful deployment of the KRC-4 Rotochute from the P2V-7 aircraft at speeds up to maximum attainable (250 knots); and deployment and operation of the companion Rotochute (KRC-4A) at 1070 feet per second (Mach .99) in a near vertical attitude at 4174 feet altitude.

Institute of Flight Structures, Columbia U., New York.
STRESS FUNCTIONS WITH AXIAL SYMMETRY IN HETEROGENEOUS BODIES, by M. B. Friedman and J. L. Sackman. Technical rept. no. 7 on Contract Nonr-266(34). Apr 59, 13p. 2 refs. CU-1-59-ONR 266(34)-CE; AD-225 390.
Order from LC mi$2.40, ph$3.30 PB 145 800

The use of stress functions are extended to the analysis of visco-elastic phenomena involving variable material properties. The results are also applicable to elasticity problems with non-constant properties. The case of axial symmetry is considered in both cylindrical and spherical coordinates.

Naval Weapons Lab., Dahlgren, Va.
QUALIFICATION OF POWER CARTRIDGES, TALCO P/N-1000-121 FOR F8U-1 AIRCRAFT CANOPY REMOVER, by J. P. Matarrese. 4 Feb 60, 44p. 7 refs. NWL rept. no. 1685.
Order from LC mi$3.30, ph$7.80 PB 145 777

The power cartridge for use in the F8U-1 canopy remover was evaluated in accordance with applicable sections of MIL-D-21625 and Chance Vought Aircraft Incorporated Specification CVA 1202C. Final release of the cartridge to service for use within the operational temperature range of -65°F to +160°F is recommended. The functions of the evaluated cartridges in the canopy removal system and the test procedures, instrumentation and methods of data analysis employed in the evaluation are described. (Author)

Purdue Research Foundation, Lafayette, Ind.
A SURVEY OF GERMAN HOLLOW TURBINE BLADE DEVELOPMENT. PART I: INITIAL INVESTIGATIONS AND DEVELOPMENTS, by E. N. Petrick. Rept. on Contract W33-038-ac-17625. Oct 49, declassified 26 Mar 51. 222p. 39 refs. ATI-79 552; 102-AC-49/14-23.
Order from LC mi$9.90, ph$34.80 PB 146 852

This report is the first in a series of three dealing with German developments in the field of turbine blade cooling, with particular emphasis on the use of air-cooled hollow turbine blades. The current report contains (a) a discussion of the various methods of turbine cooling considered by the Germans, (b) information on the initial investigations and developments, and (c) methods of improving internal blade cooling.

SKF Industries, Inc., [Philadelphia, Pa.]
ENDURANCE TESTS OF ROLLING CONTACT BEARINGS OF CONVENTIONAL AND HIGH TEMPERATURE STEELS UNDER CONDITIONS SIMULATING AIRCRAFT GAS TURBINE APPLICATIONS, by H. O. Walp, R. P. Remorenko, and J. V. Porter. Rept. for Feb 53-Feb 58 on Contract AF 33(600)22860. July 59, 87p. WADC Technical rept. 58-392; AD-212 904.
Order from OTS $2.25 PB 161 672

Endurance tests of rolling contact bearings of conventional and high temperature steels were conducted at two temperature levels and at normal and high speeds. Test results indicate that the fatigue life of the high temperature steels is materially increased by vacuum melting. High speed ball bearings, alike in all respects except for ball diameter variations, were tested at high speed to study dimensional effect on endurance life. Results of the endurance tests indicate no correlation of individual bearing life with observed dimensional variations for the same bearings. To provide a means of determining the fatigue properties of materials without using complete bearings, simple specimen testing machines were designed and operated. (Author)

Systems Technology, Inc., Inglewood, Calif.
THE DETERMINATION OF LATERAL HANDLING QUALITY REQUIREMENTS FROM AIRFRAME-HUMAN PILOT SYSTEM STUDIES, by Irving L. Ashkenas and Duane T. McRuer. Rept. on Contract AF 33(616)5661. June 59, 90p. 57 refs. WADC Technical rept. 59-135; AD-212 152.
Order from OTS $2.25 PB 161 538

Pilot describing functions and airframe transfer functions are combined within a servo analysis framework to develop a partial theory of lateral handling qualities. Tentative criteria for certain roll/aileron transfer function quantities are derived and compared with existing pilot opinion data to establish limited regions of validity. The report contains a summary of pilot dynamic capabilities in closed loop tasks, airframe lateral transfer function characteristics and parameters, and current dynamic lateral handling qualities requirements and data. (Author)

Chemical Engineering

Aerospace Medical Lab., Wright Air Development Div., Wright-Patterson AFB, Ohio.
DESIGN STUDY OF HIGH PRESSURE OXYGEN VESSELS, by Donald A. Keating. Rept. for Sep 58-May 59 on Equipment for Life Support in Flight Operations. Feb 60, 28p. 9 refs. WADC Technical rept. 59-767.
Order from OTS $0.75 PB 161 666

The feasibility of storing gaseous breathing oxygen under extreme high pressures for life support in flight operations is investigated. The method of solution is theoretical in nature utilizing both analytic and graphic techniques. In general, high pressure oxygen storage vessels utilizing an internal pressure at approximately 7500 psia were found to be theoretically superior on a weight-volume basis to standard liquid oxygen converters for missions of moderate duration. The optimum internal pressure is based on the minimum mathematical product of vessel weight and volume, and is dependent upon the strength characteristics of the vessel material. (Author)

Army Chemical Warfare Labs., Army Chemical Center, Md.
AIRCRAFT-TRACKING COLORED-SMOKE MARKER, by Woodrow W. Reaves and Kenneth G. Carlon. Rept. for May 55-Oct 57 on Dissemination Research on CW Agents. Jan 60, 24p. CWLR 2338; AD-231 129.
Order from LC mi$2.70, ph$4.80 PB 146 061

Investigation for the Navy of a smoke tracking device to aid in visual tracking of guided missiles and rockets during test flights resulted in the development of a marker designated the E24 aircraft-tracking red-smoke marker. This marker is essentially a pair of smoke canisters mounted in a pod suspended from the

wing racks of an aircraft. The pyrotechnic composition of the marker consists of the following: red dye, 57.0 parts by weight; potassium chlorate, 25.0 parts by weight; and thiourea, 18.0 parts by weight. This formulation was tested in an aircraft traveling at a speed of 570 knots at an altitude of 30,000 feet or higher, and produced a clearly visible smoke trail for approximately 3 minutes.

Army Chemical Warfare Labs., Army Chemical Center, Md.
DEVELOPMENT TESTING OF PORTABLE DECONTAMINATING APPARATUSES: E17R1, 1-1/2-QUART (NONEXPENDABLE) AND E18, 1-QUART (EXPENDABLE) by John H. Buddemeyer and M. F. Gilchrist. Aug 59, 33p. 11 refs. CWLR-2302.
Order from LC mi$3.00, ph$6.30 PB 146 058

The object was to develop a small improved decontaminating apparatus which would meet prescribed military/technical characteristics. This report concerns the development testing of the nonexpendable Decontaminating Apparatus, and the attempted development of the expendable Decontaminating Apparatus. The unit, designed for mounting on vehicular-type equipment, was to serve for decontaminating the essential components of these systems to a degree where continuous operation was assured. Conclusions: The E17R1 unit meets the prescribed military/technical characteristics for an improved small decontaminating apparatus, and is a satisfactory development prototype for final engineering testing. A prepressurized apparatus such as the E18 is not feasible when used with DS2 solution if operation is required over a wide temperature range.

Army Chemical Warfare Labs., Army Chemical Center, Md.
GAS-AEROSOL FILTER MATERIAL PILOT PLANT, by Morris Thompson and Bernard J. Bruns. Sep 59 217p. CWLR-2297.
Order from LC mi$9.60, ph$33.30 PB 146 171

This report covers the relocation of the filter material pilot plant from Pittsburgh, Pennsylvania, to the Army Chemical Center, Maryland, the modifications to this plant and the changes to the dry process for making Gas-aerosol filter material for the M17 field protective mask. The pilot plant was relocated, modified, and operated to make changes to and to gather data on the dry process.

THERMAL PARAMETERS ASSOCIATED WITH IGNITION OF THE MAGNESIUM-BARIUM NITRATE SYSTEM, by Martin Gilford and Saul Gordon. Mar 60, 27p. 11 refs. Technical notes no. 43.
Order from LC mi$2.70, ph$4.80 PB 144 830

The effects of the thermal blanketing technique and of high-humidity storage on the ignition behavior of the magnesium-barium nitrate system have been investigated.

Indiana U., Bloomington.
A DIGITAL PULSE INTEGRATOR FOR FLASH INTENSITY MEASUREMENTS, by Henry H. Kramer and Edward J. Bair. Rept. on Contract AF 18(603)93. 29 Aug 58, 13p. 3 refs. AFOSR-TN-58-777; AD-201 925.
Order from LC mi$2.40, ph$3.30 PB 138 173

A digital pulse integrator is described for measuring the voltage-time area of electrical impulses such as the photocurrent resulting from the photoelectric observation of a xenon flash source. As the basis of its operation, the positive pulse to be integrated charges a capacitor. A decade scaler then counts the number of smaller negative pulses from a crystal oscillator that are required to discharge the capacitor to its original voltage.

Willow Run Labs., U. of Michigan, Ann Arbor.
THE PHASE DIAGRAM FOR THE BINARY SYSTEM CADMIUM-TELLURIUM, by Donald R. Mason and Bernard M. Kulwicki. Rept. on Project Michigan, Contract DA 36-039-sc-78801. Apr 60, 33p. 13 refs. 2900-139-R.
Order from LC mi$3.00, ph$6.30 PB 146 870

The phase diagram for the cadmium-tellurium system has been redetermined by measuring the thermal behavior of representative compositions in the system by the method of differential thermal analysis. The experimental details and the resulting data are described and discussed. Thermodynamic analysis shows that the system CdTe-Te appears to form an ideal solution. The latent heat of fusion of CdTe is estimated to be 10,700 cal/gm mol. The system Cd-CdTe is an elementary solution and has a relatively large excess partial molar entropy of solution and a large partial molar enthalpy of solution. These partial molar qualities are independent functions of composition, but not of temperature. The eutectic compositions have been determined as 10^{-6} atom-fraction Te and about 0.99 atom-fraction Te. The validity of this work vis-a-vis that of other investigators is discussed. (Author)

A SURVEY OF THE LITERATURE ON THE THEORY OF THIN-WALLED BARS, by J. Nowinski. Rept. on Contract DA 11-022-ORD-2059. Oct 58, 39p. 133 refs. MRC Technical summary rept. no. 57; AD-207 995.
Order from LC mi$3.00, ph$6.30 PB 145 872

Stanford U., Calif.
INVESTIGATION OF SHEAR WALLS. PART 9: CONTINUED EXPERIMENTAL AND MATHEMATICAL STUDIES OF REINFORCED CONCRETE WALLED BENTS UNDER STATIC SHEAR LOADING, by Jack R. Benjamin, and Harry A. Williams. Technical rept. no. 7 on Contract DA 49-129-eng-193. 1 Sep 55. 126p. 8 refs. AFSWP 888.
Order from LC mi$6.30, ph$19.80 PB 137 986

A study to determine an efficient way of strengthening walls with openings resulted in recommendations for the addition of diagonal corner bars well anchored in the edge members of the wall. In panel reinforcing localized reinforcing patterns were no better than uniform horizontal and vertical steel. A limited study was made to determine the resistance of walls to combinations of shear load in the plane of the wall and forces perpendicular to a face. (See also PB 137 465)

Stanford U., Calif.
INVESTIGATION OF SHEAR WALLS. PART 10: LIMITED STUDY OF BRICK AND CONCRETE BLOCK SHEAR WALLS WITH STEEL FRAME, by Jack R. Benjamin, Harry A. Williams and others. Technical rept. no. 8 on Contract DA 49-129-eng-193. Sep 56, 54p. 7 refs. AFSWP 889.
Order from LC mi$3.60, ph$9.30 PB 137 987

This report gives results of a limited investigation of brick and concrete block shear walls, with and without openings, and enclosed in a steel frame. Rough methods of predicting the load-deflection characteristics of such walls are given. (See also PB 137 986)

Electrical and Electronic Engineering

Airborne Instruments Lab. [Melville] N. Y.
APPLICATION OF SEMICONDUCTOR DIODES TO MICROWAVE LOW-NOISE AMPLIFIERS AND HARMONIC GENERATORS, by J. C. Greene, E. Kraemer, and others. Quarterly progress rept. no. 3, 1 Jan-31 Mar 59, on Contract DA 36-039-sc-78161. 15 Apr 59, 23p. 5 refs. Rept. no. 5872-1-3.
Order from LC mi$2.70, ph$4.80 PB 145 807

Preliminary experimental results are presented on the operation of a microwave third-harmonic generator. In the experimental model, the input signal frequency is about 1000 Mc, and the impedances presented to the fundamental, second, and third harmonic currents are independently variable. The inability to obtain the large predicted values of gain-bandwidth products at higher operating frequencies is tentatively attributed to diode lead inductance. (See also PB 142 622)

Airborne Instruments Lab., Melville, N. Y.
APPLICATION OF SEMICONDUCTOR DIODES TO MICROWAVE LOW-NOISE AMPLIFIERS AND HARMONIC GENERATORS, by J. C. Green, E. Kraemer, and others. Final progress rept. 30 June 58-30 June 59, on Contract DA 36-039-sc-78161. 15 July 59, 70p. 22 refs. Rept. no. 5872-1; AD-225 845.
Order from LC mi$3.90, ph$10.80 PB 145 806

A theory for the maximum achievable voltage gain-fractional bandwidth product of one-port and two-port difference frequency reactance amplifiers has been worked out. Low-frequency and microwave experiments indicate good agreement between theoretical and measured values. The noise figure of a reactance amplifier designed in this manner is nearly optimum. (See also PB 145 807)

Battelle Memorial Inst., Columbus, Ohio.
LABORATORY TEST PROCEDURES FOR PREDICTING THE TROPICAL-SERVICE LIFE OF ELECTRONIC COMPONENTS AND MATERIALS, J. L. Easterday, A. E. Mace, and W. E. Chapin. Final summary rept. for 1 Sep 54-31 Mar 59 on Contract DA 36-039-sc-64518. 31 Mar 59, 122p. 20 refs. AD-226 309.
Order from OTS $2.75 PB 161 692

This report contains the summarized base-line data obtained from over 3 years' exposure to tropical environments for a wide variety of electronic components. Several laboratory investigations were conducted; the results of this work have been analyzed and correlated to the base-line data obtained from the tropical exposures. Acceleration factors relating laboratory investigations to the tropical exposures have been formulated and are presented.

Bell Telephone Labs., New York.
SUBMINIATURE FIXED CAPACITORS, by D. A. McLean, H. G. Wehe, and J. K. Werner. Final rept. for 1 July 55-30 June 57 on Contract DA 36-039-sc-64695. June 57, 68p. 4 refs. Rept. no. 26286-G; AD-156 911.
Order from LC mi$3.90, ph$10.80 PB 145 979

Final models of both grade 1 and 2 capacitors were completed and delivered along with drawings and specifications. The original purpose for grade 1 capacitors for 1-mc use was achieved except that the tan δ requirement was applied at 200 kc instead of 1 mc. The original requirements of tan δ = 0.0015 max were achieved or closely approached. A practicable design was established for subminiature, supported-film, fixed capacitors with mica-like properties for use in LV transistor circuits. Using polystyrene lacquer supported by metallized strips of paper, a capacitance of >25,000 µµf was placed in a volume of 0.03-cu in. with no dimension greater than 5/8 inch. The complete original purpose for grade 2 capacitors was not achieved. Tan δ requirements were readily met, but the capacitance was low if the IR was satisfactory, and vice versa. An alternate film was used, a stripped lacquer film of cellulose acetate, with new objectives of 0.15 µf minimum, tan δ of 0.02 max at 1 kc, in 0.03 cu inch. With this film, the new objectives were completely achieved. The capacitance was 0.23 µf, tan δ was less than 0.02 at 1 kc (and less than 0.03 at 100 kc.). The initial IR's at 50-v dc were greater than 1000 ohm-farads, the median IR being 20,000 ohm-farads at room temperature. Capacitors showed satisfactory life-test performance at 100-v dc (twice rated voltage) at temperatures between -55°C and 65°C for periods exceeding 440 hr.

Bright Star Industries, Clifton, N. J.
FLAT CELL MAGNESIUM DRY CELL BATTERIES, by F. A. Keller. Semi-annual progress rept. no. 1, 30 Sep 58-31 Mar 59, on Contract DA 36-039-sc-78231. [1959] 12p.
Order from LC mi$2.40, ph$3.30 PB 145 803

The dimensions and design for the flat Magnesium "N" cell and its components have been established. All tools are satisfactory except the stellite die and punch for the mix cake.

Centre de Physique Eléctronique et Corpusculaire (France).
WIDE DYNAMIC RANGE BARRIER GRID STORAGE TUBE T.C.M. 16, by G. Wendt. Rept. on Proj. NR-048-140. 31 May 59, 21p. W.R. 406; AD-218 425.
Order from LC mi$2.70, ph$4.80 PB 146 261

In the first part of the present report we will describe the technological improvements made on the TCM 16 gun. We were able through them to get stable characteristic curves which showed the required current linearity. In the second part we studied the formation of the electron beam in such a gun. With an electrolytic tank fields have been plotted and rays traced. Moreover a tube having a metallic target with a slit allowed us to see how the spherical aberration did depend upon the nature of the focusing lens, either electrostatic or magnetic. In the third part we describe the tests made with that gun shooting on a memory target of our usual type. (See also PB 145 585)

Chatham Electronics, Livingston, N. J.
DEVELOPMENT AND EVALUATION OF ELECTRON TUBE GLASSES RESISTANT TO RADIATION DAMAGE, by G. R. Weinberg. Final rept. for 1 May 58-30 Apr 59 on Contract DA 36-039-sc-75065. [1959] 26p. AD-220 199.
Order from LC mi$2.70, ph$4.80 PB 146 041

Enclosures made of various glass without leads and with matching leads sealed-in were exposed to an integrated thermal neutron flux of 10^{16}NVT. Except for glass type 7052, no damage besides discoloration could be noticed. The 7052 glass with sealed-in molybdenum leads cracked when exposed to an integrated thermal neutron flux of 10^{16}NVT. Type 7720 glass with sealed-in tungsten leads cracked when exposed to an integrated thermal flux of 10^{17}NVT.

Clevite Transistor Products, Waltham, Mass.
RESEARCH AND DEVELOPMENT OF GERMANIUM PNP JUNCTION SWITCHING TRANSISTORS, by Paul L. Meretsky. Quarterly progress rept. no. 3, 10 Dec 58-9 Mar 59, on Germanium High Current NPN or PNP Junction Switching Transistor, Contract DA 36-039-sc-75060. [1959] 26p; AD-218 663.
Order from LC mi$2.70, ph$4.80 PB 145 876

Approximately fifty germanium PNP transistors meeting all electrical specifications of SCL-5522 were on hand. Measurements indicate that reliable hermetic enclosures have resulted. (See also PB 142 760)

Clevite Transistor Products, Waltham, Mass.
RESEARCH AND DEVELOPMENT OF GERMANIUM PNP JUNCTION SWITCHING TRANSISTORS, by Paul L. Meretsky. Quarterly progress rept. no. 4, 10 Mar-9 May 59, on Germanium High Current NPN or PNP Junction Switching Transistor, Contract DA 36-039-sc-75060. [1959] 30p.
Order from LC mi$2.70, ph$4.80 PB 146 167

The work continued along the lines of solving the burnout problem. At present it appears that the lowest possible resistivity combined with the widest possible alloyed base width leads to fewer burnouts in the switching test. (See also PB 142 760)

David Sarnoff Research Center, Princeton, N. J.
HIGH-TEMPERATURE SEMICONDUCTOR DEVICES, by A. Amith, L. Ekstrom and others. Scientific rept. for 15 Feb 57-30 Sep 59 on Contract AF 33(616)5029. 31 Oct 59, 131p. 63 refs. AFCRC-TN-60-134.
Order from OTS $2.75 PB 161 541

Purification, crystal growth, and evaluation of the compounds, GaAs and InP. Determination of Impurities in GaAs, Diffusion in GaAs and InP, and Minority Carrier Lifetime in GaAs. Fabrication of diodes, rectifiers, and transistors of both GaAs and InP. Large single crystals of GaAs and InP have been prepared by four different growth techniques with low dislocation densities and with no lineage. Purification techniques have been devised by which arsenic, phosphorus, and gallium are prepared with a purity of about 99.9999%. Single crystal growth of arsenic from the melt, the distillation of arsenic from lead-arsenic alloys, the vacuum annealing of gallium with a cold "finger", single crystal growth of gallium, and chemical and physical treatments of phosphorus. The diffusion of indium and phosphorous in InP was studied using radioactive tracers of these elements. Photoconductance and the photoelectromagnetic effect have been measured over the temperature range 80°K-300°K with a view toward learning the lifetime of minority carriers. The basic technology important to the fabrication of most known devices has been demonstrated in GaAs and InP. This includes point contacts, metal semiconductor contacts, and alloy and diffusion junctions. Devices such as the microwave diode, parametric amplifier, large and small signal rectifiers, tunnel diode, and unipolar transistor have been successfully made.

Diamond Ordnance Fuze Labs., Washington, D. C.
EFFECTS OF PULSED NUCLEAR RADIATION ON NONOPERATING TUBES AND TRANSISTORS, by Herbert G. Chandler. 20 Nov 59, 20p. 4 refs. Technical rept. TR-795; AD-230 237.
Order from LC mi$2.40, ph$3.30 PB 146 077

During Operation Hardtack electron tubes of both ceramic and glass construction and transistors were exposed to nuclear radiation while they were not functioning. These components were subjected to neutron bombardment as great as 4×10^{14} Pu^{239} nvt. No deleterious effects on the electron tubes were observed under these conditions. However, measured transistor parameters suffered large percentage changes from radiation greater than 3×10^{13} Pu^{239} nvt. These effects were much greater in audio than in RF types. (Author)

Diamond Ordnance Fuze Labs., Washington, D. C.
PHASE SYNCHRONIZATION OF SUPERREGENERATIVE OSCILLATIONS, by H. G. Fritz. 28 Dec 59, 20p. 3 refs. Technical rept. TR-780; AD-231 044.
Order from LC mi$2.40, ph$3.30 PB 146 079

Pulsed continuous-wave and absolutely periodic oscillator spectra are discussed with emphasis on line position. Experimental pulsed continuous-wave spectra are shown. The superregenerative phase-synchronized spectrum is derived. It is shown that the spectral lines for a superregenerative oscillator controlled by an external signal occur about the signal frequency regardless of the oscillator frequency and regardless of changes in this frequency during the quench pulse. This effect is attributed to synchronization of the oscillator starting phase with the external signal. Experimental spectra are used to illustrate this principle. The difference between phase synchronization and locking is stressed. Photographs of spectra for a locking CW oscillator are shown. (Author)

Diamond Ordnance Fuze Labs., Washington, D. C.
STATUS OF ELECTRONIC MICROMINIATURIZATION: FEBRUARY 1960, by Norman J. Doctor. 4 Mar 60, 29p. 31 refs. TR-823.
Order from OTS $0.75 PB 161 674

Major programs in electronic microminiaturization currently being pursued by educational, Governmental, and industrial laboratories are described. The techniques reviewed include: (1) welding of miniature commercial parts, (2) soldering of miniature commercial parts to miniature etched-wiring boards, (3) riser-wire connecting of wafer microelements, (4) printing of multicomponent circuits on single ceramic substrates and (5) forming of both integrated and functional solid circuits. An extensive bibliography is included. (Author)

Diamond Ordnance Fuze Labs., Washington, D. C.
THEORY OF THE GERMANIUM DIODE MICROWAVE SWITCH, by Robert V. Garver, John A. Rosado, and Edward F. Turner. 15 July 59, 14p. 13 refs. Technical rept. TR-747; AD-228 975.
Order from LC mi$2.40, ph$3.30 PB 146 060

The application of a generally neglected theory of microwave detection to the poorly understood problem of p-n semiconductor junction behavior at microwave frequencies is discussed. Experimental results are presented which appear to be the first direct experimental verification of the theory. The theory predicts that germanium microwave diodes should exercise direct switching action upon microwaves while silicon microwave diodes should not, as had been observed in the past but with no explanation. (Author)

Dielectrics Lab., Johns Hopkins U., Baltimore, Md.
A PRACTICAL INTERPRETATION OF DIELECTRIC MEASUREMENTS UP TO 100-MC, by J. J. Chapman and L. J. Frisco. Rept. on Contract DA 36-039-sc-73156. 31 Dec 58, 211p. 23 refs.
Order from OTS $3.50 PB 161 545

The rapid development of the electronics industry in recent years has brought about a demand for increased activity in the development of insulating materials and design techniques which can be applied to high-frequency problems. With the ever increasing demands of industry and the military for greater power output ratings from smaller units, the insulating material has become the critical part of many assemblies. The authors have made extensive investigations of the behavior of solid insulating materials over the frequency range of 60-cps to 100-mc. The primary objective of these studies was to determine the effects of frequency, temperature and moisture absorption on the electrical properties of representative insulating materials. Particular emphasis was placed on the measurement of electric strength at frequencies up to 100-mc. The purpose of this present report is to summarize all of the data in a convenient form and to discuss the results from a practical, rather than an academic viewpoint.

Eastman Kodak Co., Rochester, N. Y.
BASIC RESEARCH INVESTIGATIONS FOR AMMONIA VAPOR ACTIVATED BATTERIES, by J. M. Freund, V. M. Bryant, and J. B. Schliff. Quarterly progress

rept. no. 7, 15 Mar-14 June 59, on Contract DA 36-039-sc-74902. [1959] 21p. AD-226 662.
Order from LC mi$2.70, ph$4.80 PB 145 878

Data are given for the conductance of ammonia solutions of NH_4SCN at concentrations ranging between 6 mol% and 40 mol% NH_4SCN, at temperatures between -70°C. and +30°C. Preliminary data are presented for NH_4NO_3 and NaSCN solutions and on the effect of water or CO_2 additives to NH_4SCN solutions. Some information is also given on the vapor pressure of moderately concentrated NH_4SCN solutions, 8.3 and 13.2 mol%. These pressures are about 80% and 60%, respectively, of the pressure of pure ammonia at the same temperature. (Author) (See also PB 143 896)

Educational Research Corp. [Cambridge, Mass.]
A COMPARISON OF TWO METHODS OF TEACHING MORSE CODE, by Philip J. Rulon and W. Douglas Brooks. Rept. on Contract N61339-294. 11 Jan 60, 29p. 11 refs. Technical rept. NAVTRADEVCEN-294-2.
Order from LC mi$2.70, ph$4.80 PB 145 833

The results of this study indicate that with regard to speed, there is no difference between the groups at any time during the course of training. One method requires about the same length of time to increase the students' speeds to certain levels, whether this speed is 4, 10, 16 or 22 words per minute. At the end of 22 weeks of instruction, students taught by one method are just as fast and as accurate as students taught by the other. The only differences found were that during the early weeks of code training, the Robins method produced more accurate students than did the standard Navy method.

Eitel-McCullough, Inc., San Bruno, Calif.
EVALUATION OF UHF PLANAR TRIODE TUBE TYPE 2C39A IN THE POSITIVE GRID REGION. Final technical rept. for 15 Nov 57-15 Oct 58 on Contract DA 36-039-sc-74815. [1958] 35p. AD-225 985.
Order from LC mi$3.00, ph$6.30 PB 145 935

This work was undertaken to establish tube capabilities in the positive grid region and to provide data as a basis for setting test limits suitable for inclusion in a procurement specification. Long-pulse (4500 μs) tests in the positive-grid region were made on nine monthly, 10-tube samples of 2C39A tubes over a six-month period. Results were analyzed statistically and means and standard deviations are reported for each of the tests. No correlation was found between the long-pulse tests and the conventional tests of the MIL-E-1/546 TSS. (Author) (See also PB 142 994)

Electrical Engineering Research Lab., U. of Illinois, Urbana.
INVESTIGATION OF MICROWAVE DUPLEXER SWITCHING MECHANISMS, by A. Aharoni, R. Poeschel and others. Quarterly progress rept. no. 7, 1 Nov 58-28 Feb 59, on Contract DA 36-039-sc-73150. 31 Mar 59, 45p. 13 refs. AD-225 731.
Order from LC mi$3.30, ph$7.80 PB 145 936

Under Task A experiments were performed: (1) to improve upon the precision in the determination of the collision cross section, for momentum transfer, of water vapor molecules for slow electrons of a room temperature (300°K) electron gas; (2) to analyze the free electron loss processes as influenced by immersion in the volume of the gas container solid substances (quartz wool) in Helium and Argon discharges; (3) to investigate the gas dynamics in pulsed electrical discharges in rate gases of short duration moderate intensities. Under Task B research of semiconductor behavior in high level eight millimeter waves was continued. Previously observed spurious phenomena associated with the high level eight millimeter pulsed signals have been analyzed in detail and found to be due to a sizable second harmonic component of the (8mm) magnetron output. The elimination and/or use, as the case may be, of this harmonic component in the microwave pulsed signal will permit the development of a method by which changes in mobility and carrier concentration in both microwave fields can be determined. (Author) (See also PB 142 996)

Electron Tube and Microwave Lab., Calif. Inst. of Tech., Pasadena.
POWER FLOW AND GAP COUPLING TO SLOW WAVE PLASMA MODES, by Gary D. Boyd. Technical rept. no. 12 on Contract Nonr-220(13). June 59, 37p. 10 refs. AD-220 086.
Order from LC mi$3.00, ph$6.30 PB 146 516

The interaction impedance for the slow wave plasma modes of Trivelpiece and Gould is obtained for a coaxial system of plasma column, surrounding dielectric and conducting surface. The theory presented includes a finite axial magnetic field. Calculations are presented for the special case of no static magnetic field for the so-called surface wave interaction impedance versus βa. Coupling to the slow wave plasma modes by a known electric field across a gap in the conducting surface at the dielectric surface is analyzed for the coaxial plasma system including a static axial magnetic field. This results in an impedance as seen by the cavity gap. Calculations are presented for the special case of no static magnetic field. (Author) (See also PB 151 638)

Electronic Communications, Inc., Timonium, Md.
AUTOMATIC CONTROL OF RADIO FREQUENCY PHASE SHIFT, by S. N. Broady and R. G. Roush. Final rept. on Contract AF 19(604)2407. 31 Oct 59, 41p. 3 refs. AFCRC-TR-59-363.
Order from LC mi$3.30, ph$7.80 PB 145 757

The purpose of this report is to investigate and develop feed-back techniques to provide precision electronic control of phase shifter devices suitable for operation in the 200 to 1500 Mc/sec frequency band. Three phase control systems are discussed: The first, developed under another contract, provided the basis for the work described herein. The second, a refinement of this original system, was found to be unrealizable in this frequency range. The third and successful system can be realized conveniently at both UHF and microwave frequencies.

Electronic Defense Lab., Sylvania Electric Products, Inc., Mountain View, Calif.
SPARE PARTS KITS AT MINIMUM COST, by Guy Black and Frank Proschan. Rept. on Contract DA 36-039-sc-75012. 13 Oct 58, rev. 4 Dec 59, 33p. 14 refs. Technical Memo. no. EDL-M154; AD-208 305.
Order from LC mi$3.00, ph$6.30 PB 146 876

The root of the problem is that spare parts consumption is a random process. Statistical records on electronic component failure indicate that often the rate of failure is quite constant during a large part of equipment life, meaning that an exponentially declining probability density function must be used to describe the probability that a component will survive a given number of hours.

Electronics Research Lab., U. of California, Berkeley.
SCATTERING BY A NONRESONANT SLOT IN A RECTANGULAR GUIDE, by N. Kusnezov. 10 Dec 58, 42p. 14 refs. IER Series no. 60, Issue no. 219. Rept. no. 76.
Order from LC mi$3.30, ph$7.80 PB 145 850

The approximate solution is explored for a thin slot in a rectangular wave guide as obtained by Stevenson (Jnl. of Applied Physics 19:24-38 (1948)), and later improved in this laboratory by Held (ERL rept. 27, PB 117 529). Although both theories treat the same problem, they arrive, in the case of a resonant slot, at answers which differ in form considerably.

Electronics Research Lab., U. of California, Berkeley.
SCHEME FOR IMPROVING BEAM-TUBE PERFORMANCE BY DEPRESSING COLLECTOR POTENTIAL, by J. W. Hansen. Scientific rept. no. 7 on Contract AF 19(604)2270. 15 Dec 59, 48p. 18 refs. IER Series no. 60, issue no. 260; AFCRC-TN-59-977.
Order from LC mi$3.30, ph$7.80 PB 145 767

The present state of the art of depressed-collector design is reviewed and the characteristics of various designs are discussed. A design is proposed with desirable characteristics of most present designs but without the common disadvantage of adding to the size and weight of the tube. The performance of the collector is evaluated experimentally and is found to be promising. The device is readily adaptable to a rugged, simple collector for a commercial tube. The possibility of modification of the design to include velocity sorting is discussed. (Author)

General Electric Co., Owensboro, Ky.
INVESTIGATION OF THE EFFECTS OF OPERATING CONDITIONS ON SUBMINIATURE ELECTRON TUBES, by M. W. Edwards. Final rept. for 1 July 56-1 July 58 on Contract DA 36-039-sc-73072. [1958] 807p. AD-217 415.
Order from LC mi$11.10, ph$122.70 PB 145 925

Bulb temperature proved to be most important variable interacting with plate voltage to result in electrolysis of glass. Filament voltage ranks next to bulb temperature in importance and has more effect on slumping characteristics and less effect on electrolysis. Plate voltage has an important effect on electrolysis. Plate wattage as applied in this project had an important effect on the 6021 only, and was discarded as unimportant on all other types. Heater-cathode voltage as applied was discarded as unimportant on all types. The 5840 and 6021 display great tolerance to shock, whereas the 1AD4 and 6088 show good tolerance. The T3-Cathode type subminiatures are superior to Filamentary Cathode types. Folded Heaters are indicated to be somewhat superior to coil heaters. Electrolysis of the glass envelope opposite opening in the plate will cause early life slump. Statistical analysis has developed a figure of merit which is a valuable tool.

General Electric Co., Schenectady, N. Y.
DEVELOPMENT OF RUGGEDIZED HIGH TEMPERATURE CERAMIC UHF TUBES OF PLANAR GEOMETRY, by R. E. Manfredi and K. R. MacNaughton. Final rept. for 1 July 57-31 Oct 58 on Contract DA 36-039-sc-74859. [1958] 124p.
Order from LC mi$6.30, ph$19.80 PB 145 879

This report summarizes a program for development and/or evaluation of three ruggedized high temperature ceramic UHF tubes of planar geometry. The program included (a) design and construction of a six-stage, 500-MC amplifier for circuit evaluation of Type Z-2389 Triode as a preamplifier, (b) evaluation of Type Z-1910 Triode as a frequency doubler from 500 MC to 1000 MC and as an intermediate amplifier at 1000 MC, (c) development of Type Z-5192 Tetrode and its evaluation as a power amplifier, and (d) simultaneous demonstration of the above three tube types in a single test gear. (Author)

General Electric Co., Schenectady, N. Y.
PACKAGED VOLTAGE TUNABLE MAGNETRON, by R. G. Lock and M. Bessarab. Final rept. for 1 Mar 57-30 June 58 on Contract DA 36-039-sc-73125. [1958] 127p. 27 refs. AD-214 732.
Order from LC mi$6.30, ph$19.80 PB 145 934

A study was made of microwave circuits for voltage tunable magnetrons. Experimental results are presented for broad and narrow bandwidths at S-band. Design construction and packaging of a prototype voltage tunable magnetron oscillator was accomplished in the initial phase utilizing a Z-5112 VTM. Refined units using a Z-5299 VTM were supplied as the final units. Test data, sketches and photographs are contained in the report. (Author)

General Electric Co., Syracuse, N. Y.
70-AMPERE HIGH POWER SILICON CONTROLLED RECTIFIER, RESEARCH AND DEVELOPMENT PROGRAM, by G. N. Hall and R. P. Lyon. Quarterly progress rept. no. 1, 19 Jan-19 Apr 59, on Contract DA 36-039-sc-78278. [1959] 98p. 6 refs.
Order from LC mi$5.40, ph$15.30 PB 145 816

Junction feasibility studies have been completed and the alloy-diffused process has been chosen for fabrication. Test equipment includes: life test, forward

drop and thermal resistance, constant current, turn-off time, and PIV, VBO, gate test. Schematics and photographs of these equipments are presented.

General Electric Co., Syracuse, N. Y.
70-AMPERE HIGH POWER SILICON CONTROLLED RECTIFIER, RESEARCH AND DEVELOPMENT PROGRAM, by C. N. Hall and R. P. Lyon. Quarterly progress rept. no. 2, 19 Apr-18 July 59, on Contract DA 36-039-sc-78278. [1959] 40p. 12 refs.
AD-227 721.
Order from LC mi$3.00, ph$6.30 PB 145 815

This report includes: Two-terminal asymmetrical and symmetrical silicon negative resistance switches, by R. W. Aldrich and N. Holonyak, Jr. Phase-controlling kilowatts with silicon semiconductors, by F. W. Gutzwiller. The larger area silicon PNP pellet (.500" dia.) and emitter (.410" dia.) are being employed in the fabrication of the ZJ-70B silicon controlled rectifier. Evaluation of this junction is not complete, but fabrication feasibility and improved characteristics were demonstrated. A preliminary investigation on turn-off time was performed. This investigation was designed to probe the dependency of recovery times on structure geometry. The operating life test of five 100 volt cells has reached 500 hours with no failures. Thermal fatigue tests are in progress. Preliminary data is available. (Author) (See also PB 145 816)

General Mills, Inc., Minneapolis, Minn.
PARABALLOON ANTENNA MATERIALS STUDY, by J. H. Nash, F. J. Bollag and others. Rept. on Contract AF 30(602)1940. 1 Dec 59, 93p. 1 ref. General Mills Rept. no. 1915; RADC-TR-59-233.
Order from LC mi$5.40, ph$15.30 PB 145 835

There is currently considerable interest in the development of large, portable radar antennas. One approach which has shown some promise is the paraballoon antenna. This study deals with the development of a material suitable for application to the fabrication of paraballoon antennas.

General Radio Co., Cambridge, Mass.
FREQUENCY CONTROL SYSTEMS, by R. W. Frank and R. W. Stuart. Quarterly progress rept. no. 4, 1 Feb-1 Aug 53, on An Investigation of Circuits for the Purpose of Crystal Elimination, Contract DA 36-039-sc-15542. Aug 53, 71p. 2 refs.
Order from LC mi$4.50, ph$12.30 PB 137 908

The aim of this research is to develop a system which will permit the elimination of many quartz crystals which are currently used to control communication channel frequencies. The initial objective was to investigate two possible systems: one using multiples of phase-locked oscillators, and the second using one phase-locked oscillator driving a present continuously operating divider circuit. The second system was chosen on the basis of the work of the first three report periods. It is our purpose now, therefore, to evaluate the chosen system; and to engage in design refinements which will reduce the ideas reported here, and before, to practice for possible end-item manufacture. (Author) (See also PB 139 395, PB 142 534)

General Radio Co., Cambridge, Mass.
FREQUENCY CONTROL SYSTEMS, by R. W. Stuart. Quarterly progress rept. no. 7, 1 Feb-1 Sep 54, on [Investigation of Circuits for the Purpose of Crystal Elimination] Contract DA 36-039-sc-15542. Sep 54, 28p. 5 refs.
Order from LC mi$2.70, ph$4.80 PB 137 907

The program scheduled in the Fifth Quarterly progress report for the redesign of the scale-of-"N" counter has been completed. The three decades of the counter have been redesigned with principal emphasis on reliability, economy of power supply requirements and component totals, and the inclusion of ten-position rotary switching on all decades. The control circuits for the scale-of-"N" counter have undergone major revisions resulting in considerable reduction in complexity.

Georgia Inst. of Tech. Engineering Experiment Station, Atlanta.
HIGH FREQUENCY CRYSTAL-CONTROLLED OSCILLATOR CIRCUITS, by William A. Edson. Progress rept. no. 9 on Contract W36-039-sc-36841. 10 Aug 50, 28p. 7 refs.
Order from LC mi$2.70, ph$4.80 PB 137 869

The use of mutual inductance to compensate the crystal shunting capacitance has been reduced to practice in several oscillator circuits, and complete design procedures have been evolved, thus bringing this particular problem to a satisfactory completion. A convenient and accurate procedure for designing single layer solenoid transformers to meet specified inductance and coupling values, which has resulted from this work, is also applicable to a wide variety of problems involving radio frequency transformers. Existing theory with respect to Class C operation of triodes and pentodes has been adapted to the present problem.

Georgia Inst. of Tech. Engineering Experiment Station, Atlanta.
HIGH FREQUENCY CRYSTAL-CONTROLLED OSCILLATOR CIRCUITS, by William A. Edson. Progress rept. no. 10 on Contract W36-039-sc-36841. 10 Nov 50, 26p. 8 refs.
Order from LC mi$2.70, ph$4.80 PB 137 868

The use of inductance in series with crystals has been studied on a general basis. This work is an extension of the quarter-wave line concept as applied to the impedance-inverting oscillators, and indicates that under favorable circumstances impedance higher than that given by the quarter-wave line may be obtained. This advantage is realized, however, at the expense of frequency stability. The work on Class C operation has been continued, and a convenient design procedure for use with the grounded-grid oscillator has been evolved. Quantitative relationships are presented; their use in oscillator design is illustrated and experimentally confirmed. Additional work has been done on electron-coupled circuits for frequency multiplication. (See also PB 137 869)

Georgia Inst. of Tech. Engineering Experiment Station, Atlanta.
STUDY PROGRAM FOR INVESTIGATION TO AID IN REDUCTION AND PREVENTION OF UHF INTERFERENCE, by Floyd P. Holder, Henry W. Mauldin, Jr. and others. Technical rept. no. 3, phase 3, on Contract AF 30(602)673. 1 Oct 55, 174p. 50 refs. [RADC TR-56-89; AD-97 735]
Order from LC mi$8.10, ph$27.30 PB 137 653

This report presents the results of investigating the interference-reduction possibilities of modes of modulation and detection other than double-sideband amplitude modulation, polyphase modulation, and synchronous and polyphase detection as filtering techniques for the alleviation of common- and adjacent-channel interference. Reducing the carrier components of the amplitude-modulated signal reduces the interference generated within non-linear circuits. (See also PB 135 248)

Hughes Aircraft Co., Culver City, Calif.
DEVELOPMENT OF NARROW-BAND BANDPASS FILTERS WITH CENTER FREQUENCIES IN THE RANGE OF 10-60 MC, by Leo Storch. Interim final rept. on High Frequency Crystal Filters, Contract DA 36-039-sc-73070. Mar 58, 108p. 20 refs. Rept. no. 73070-1-F; AD-202 077.
Order from LC mi$5.70, ph$16.80 PB 146 561

The design theory for Type NB bandpass crystal filters is presented. The pertinent design equations for three-, five-, and seven-crystal filter sections of this type are given. The "Appendix B technique" is discussed in detail. The test results for five different Type NB filters are summarized. A self-contained design theory for bandpass ladder crystal filters is presented. Test results for a four-crystal ladder filter are given. The present status of the filter crystal art in the frequency range of interest is discussed. Suggestions for further work in the area of high-frequency, relatively narrow-band, bandpass filters are appended. (Author) (See also PB 146 564)

Hughes Aircraft Co., Culver City, Calif.
DEVELOPMENT OF NARROW-BAND BANDPASS FILTERS WITH CENTER FREQUENCIES IN THE RANGE OF 10-60 MC, by Leo Storch. Quarterly progress rept. no. 2, 1 Jan-31 Mar 57, on High Frequency Crystal Filters, Contract DA 36-039-sc-73070. [1957] 37p. 9 refs. Rept. no. 73070-2-Q.
Order from LC mi$3.00, ph$6.30 PB 146 564

A powerful crystal filter design procedure, which has been designated as the "Type NB technique", is outlined. Prototype designs based on this method for the following filters are described. (1) Center frequency: 11.5 mc; 6 db bandwidth: 40 kc; optimized bandpass characteristics for a total of 7 crystals. (2) Same center frequency and bandwidth as in #1, but characteristics optimized for a total of 5 crystals. (3) Center frequency: 20 mc; 3 db bandwidth: 150 kc; a total of 7 crystals. (4) Center frequency: 24 mc; 6 db bandwidth: 400 kc; a total of 8 crystals. Recent developments in linearized-phase crystal filter design are described. A prototype design of a Gaussian response filter with a 3 db bandwidth of 800 kc with respect to a center frequency of 10 mc and employing LC resonators is discussed.

Hughes Aircraft Co., Culver City, Calif.
DEVELOPMENT OF NARROW-BAND BANDPASS FILTERS WITH CENTER FREQUENCIES IN THE RANGE OF 10 - 60 mc, by Leo Storch. Quarterly progress rept. no. 4, 1 May-15 Sep 58, on High Frequency Crystal Filters, Contract DA 36-039-sc-73070. [1958] 26p. 2 refs. Rept. no. 73070-4-Q.
Order from LC mi$2.70, ph$4.80 PB 146 676

The design, construction and test results for two different high-frequency quartz crystal filters are discussed. The first of these filters possesses a center frequency of 11.5 mc, a 6 db bandwidth of 55 kc, and a sharp selectivity characteristic. The second filter is a branching filter with the center frequencies of the two constituent filters lying in the vicinity of 37 mc and the 6 db bandwidths of the individual filters equal to 3 kc. HIGH TEMPERATURE, GENERAL PURPOSE, FIXED RESISTORS, by William F. Ebling, Jr., and Henry D. Pugh. Rept. on Improved Electronic Components, Contract AF 33(616)3633. Feb 60, 57p.
WADD Technical rept. 60-131.
Order from OTS $1.50 PB 161 688

Fifty, 1500, 0.25M, and 2M-ohm resistors have been fabricated using "Carbon Alloy" resistance films deposited on high alumina substrates protected by a reducing atmosphere. Special hard soldering and leak testing procedures are discussed. Performance data is included for resistance-temperature characteristics between 25° and 500°C, load life testing for 1000 hours at 1-watt load, temperature cycling between -77° and 500°C, vibration testing from 10-3000 cycles per second at 15G, and terminal strength appraisal of 5 pounds up to and including 500°C. In 0.25M-ohm and 2M-ohm resistors and blank units, a paralleling conductivity was observed as low as 50K-ohm after 100 hours operation at 500°C. No substantiated explanation of the paralleling conductivity is presented. (Author)

TRANSISTOR LIFE EXPERIENCE: 1954-1958, by D. J. Eckl, P. A. Fergus, and R. L. Burke. Rept. on Contract AF 19(604)5200. 26 Mar 59, 40p. 7 refs.
Technical rept. no. 199; AD-214 565.
Order from OTS $1.00 PB 161 675

Original small-scale life tests, started in 1954 on the surface-barrier transistor, produced 4 million operating transistor hours with 5 transistor failures. In 1955 further data were obtained from two prototype systems: TM-1, an 8-digit multiplier, and EMAR, an experimental memory-address register. The TX-0 computer started operation in April 1956 and in April 1958 it had been in operation for 6000 hours. At this time 660 transistors were retested. All are still operating in TX-0 because of anticipation of and allowance for some parameter degradation. The most serious change has been a decrease in current gain. (Author)

SPIN ECHO RESONANCE, by Daniel E, Kaplan and Michael E. Browne. Annual status rept. no. 1 on Contract Nonr-2541(00). 1 Apr 59, 11p. LMSD-48497.
Order from LC mi$2.40, ph$3.30 PB 145 735

Development of a millimicrosecond resolution time, electron pulse spectrometer has been undertaken with the dual objectives of investigating the feasibility of information storage in electron paramagnetic systems by spin echo techniques and of providing a research tool that would be useful for studying fast relaxation phenomena in such systems.

Mallory, P. R., and Co., Inc., Indianapolis, Ind.
SWITCH, ROTARY, 3-POLE, 8-POSITION HERMETICALLY SEALED, by Lowell G. Brodrick, Donald E. Givan and others. Rept. for 27 Jan 55-20 July 59 on Improved Electronic Components, Contract AF 33(600)29252. Jan 60, 122p. 135 refs. WADC Technical rept. 59-623.
Order from OTS $2.75 PB 161 659

This report covers the research leading to the development of two entirely different types of three pole, eight position, hermetically sealed, rotary switches. Included in this report are factual data pertaining to the design and development program, the technical requirements followed, and a detailed test report for the final developmental models. The switches submitted to the Air Force for approval were designed to make and break resistive loads at 300 volts DC, 50 millamperes, with superimposed radio frequencies up to 30 megacycles at 0.1 volt rms. The switch housing employed a one-piece metal case with three rows of eight each glass-insulated, eyelet-type terminals soldered around the periphery of the case. Switching was obtained by appropriate double leaved contacts engaging rotor shoe tabs as the rotors were rotated. The switches were approximately 1.6 inches in diameter and 1.5 inches long (exclusive of terminal and shaft extensions). This represented a volume of 3.1 cubic inches and a weight of 3.1 ounces. REDESIGN OF AMPLIFIER-POWER SUPPLY AM-598 (XM-1)/U, by R. Gittleman and S. Stempler. Final engineering rept. for 26 Mar 56-18 July 58 on Contract DA 36-039-sc-71222. Corrected to 31 Aug 59, 86p. Rept. no. 3074-1; AD-226 383.
Order from LC mi$4.80, ph$13.80 PB 145 956

The program is described that led to the redesign of amplifier-power supply AM-598/U. The equipment, designated amplifier-power supply AM-598(XM-1)/U, is a completely transistorized device, utilizing printed circuitry and a plug-in design to enhance reliability, servicing, and maintenance. The equipment converts the varying prime voltage of the vehicle to the regulated voltages to operate radio receiver transmitter type RT-176. An audio amplifier to operate loudspeakers in conjunction with the radio receiver is included. (Author)

Michigan U. Research Inst., Ann Arbor.
INVESTIGATION OF MICROWAVE PROPERTIES OF FERROELECTRIC MATERIALS, by C. B. Sharpe and C. G. Brockus. Final rept. for 1 Feb 58-31 Jan 59 on Contract DA 36-039-sc-75003. Mar 59, 67p. 13 refs. 2732-4-F.
Order from LC mi$3.90, ph$10.80 PB 145 893

A method is developed for measuring the complex dielectric-constant $\varepsilon'-j\varepsilon''$ of ferroelectric materials in the frequency range 1.8-4.0 kmc. Data are given on the variation of ε' and ε'' with frequency, temperature, and bias field for a number of ferroelectric ceramics. (Author) (See also PB 138 790)

Microwave Associates, Inc., Burlington, Mass.
HIGH REPETITION RATE BROADBAND DUPLEXER, by L. Gould and E. Horn. Quarterly progress rept. no. 3, 15 Feb-15 May 59, on Contract DA 36-039-sc-78165. 4 Apr 58, 44p. AD-226 815.
Order from LC mi$3.30, ph$7.80 PB 146 494

Measurements of arc loss and recovery time as a function of gas pressure were obtained for argon, neon, krypton and xenon using an encapsulated window containing medium density quartz wool. In addition, measurements of recovery time as a function of gas processing indicate that impurities may be present which increase the arc loss. Measurements of arc loss and recovery time as a function of peak incident power were obtained for argon at various gas pressures. A study of echo signal attenuation as a function of time indicates that the rate of attenuation is a function of the nature of the gas and the gas pressure. The TR filter design investigation shows that a bandpass of 2400 to 2800 Mc with a VSWR less than 1.3 can be obtained for a single tube incorporating an encapsulated input window. (Author)

Microwave Associates, Inc., Burlington, Mass.
INVESTIGATION OF DUPLEXING TECHNIQUES AT HIGH DUTY CYCLE CONDITIONS, by Lawrence Gould. Quarterly progress rept. no. 1, 1 Oct-31 Dec 58, on Contract DA 36-039-sc-78233. [1958] 32p. AD-217 834.
Order from LC mi$3.00, ph$6.30 PB 145 958

A study program for a theoretical and experimental study and investigation of techniques leading to the development of microwave duplexers for operation at high duty cycle conditions has been initiated. Gas discharge switching devices are discussed and the recovery time and arc loss values are presented for a number of gases. Preliminary results on ferrite circulators are discussed. Insertion loss values of less than 0.4 db were obtained. Some results on crystal protector TR tube at high repetition rate are presented. Recovery times less than 0.1 μs can be achieved for both gas switching elements and crystal protector TR tubes. (Author)

Microwave Associates, Inc., Burlington, Mass.
INVESTIGATION OF DUPLEXING TECHNIQUES AT HIGH DUTY CYCLE CONDITIONS, by Lawrence Gould. Quarterly progress rept. no. 2, 1 Jan-31 Mar 59, on Contract DA 36-039-sc-78233. [1959] 26p. AD-226 012.
Order from LC mi$2.70, ph$4.80 PB 145 959

An analysis of the power handling limitations of ferrite circulators at low values of peak power and high repetition rates is discussed. The results indicate that the thermal conductivity, insertion loss, and height of the ferrite material are important parameters. Techniques for enhancing the power handling capability of crystal protector TR tubes is discussed. In particular, a balanced ATR switch shows promise for this application. Preliminary studies on limiting with ferrites showed values of threshold power of the order of 100 peak power. (Author) (See also PB 145 958)

Microwave Associates, Inc., Burlington, Mass.
INVESTIGATION OF DUPLEXING TECHNIQUES AT HIGH DUTY CYCLE CONDITIONS, by Lawrence Gould. Quarterly progress rept. no. 3, 1 Apr-30 June 59, on Contract DA 36-039-sc-78233. [1959] 17p. AD-228 147.
Order from LC mi$2.40, ph$3.30 PB 146 495

The feasibility of Tee circulators as high duty cycle duplexers in considered. Experimental models indicate that for bandwidths of the order of 3 to 4% isolations higher than 20 db and insertion losses less than 0.3 db can be achieved. The circulators were evaluated as high as 70 w average power at extremely high repetition rates with no deterioration in performance. Measurements on the characteristics of crystal protector TR tubes were continued. Results on recovery time and leakage power are reported. Of significance is the discontinuity in recovery time and leakage power at the peak power corresponding to input window breakdown. (Author) (See also PB 145 959)

Microwave Associates, Inc., Burlington, Mass.
RESEARCH AND DEVELOPMENT PROGRAM ON A MINIATURE X-BAND PULSED MAGNETRON (MA208) by A. C. Bougas. Final progress rept. for 1 Oct 57-31 Dec 58 on Contract DA 36-039-sc-74919. [1959] 56p. AD-220 530.
Order from LC mi$3.60, ph$9.30 PB 146 015

A description is presented of the final electrical and mechanical design characteristics for the MA208 magnetron. A photograph, outline drawing, and cross-section view of the final magnetron are included. A summary of the major technical and operational problems encountered is given. The methods of approach used to solve the problems are related. The general problem areas are divided and described according to the major sub-assemblies involved.

Microwave Engineering Labs., Inc., Palo Alto, Calif.
INVESTIGATION OF MICROWAVE NON-LINEAR EFFECTS UTILIZING FERROMAGNETIC MATERIALS, by Roy W. Roberts. Quarterly progress rept. no. 8, 1 Feb-30 Apr 59, on Contract DA 36-039-sc-73278. [1959] 22p. 5 refs. AD-220 227.
Order from LC mi$2.70, ph$4.80 PB 146 492

Thin slabs of ferrite magnetized in the plane of the slab have been tried for harmonic generation. In general, the slab geometry has not given as large outputs as other configurations which have been investigated more extensively. (See also PB 142 766)

Microwave Engineering Labs., Inc., Palo Alto, Calif.
INVESTIGATION OF MICROWAVE NON-LINEAR EFFECTS UTILIZING FERROMAGNETIC MATERIALS, by Roy W. Roberts. Quarterly progress rept. no. 9, 1 May-31 July 59, on Contract DA 36-039-sc-73278. [1959] 32p. 2 refs. AD-229 053.
Order from LC mi$3.00, ph$6.30 PB 146 491

Efficient doubling was obtained with a single crystal yttrium iron garnet sphere. A sphere grinder and resonance linewidth test fixture were built for checking the quality of the single crystal garnets grown under this program. (See also PB 146 492)

Microwave Associates, Inc., Burlington, Mass.
VARIABLE CAPACITANCE MICROWAVE DIODE. Quarterly progress rept. no. 2, 1 Feb-30 Apr 59 on Contract DA 36-039-sc-78236. [1959] 52p. 4 refs. AD-225 433.
Order from LC mi$3.60, ph$9.30 PB 145 960

A technique is discussed for measuring varactor cutoff frequency at X-band. The cutoff-frequency values are conservative and may be treated as lower limits, because cartridge and holder losses are included. The main features of the techniques are: use of high frequency, exploitation of the variable capacitance property as an essential part of the measurement, and use of low-loss tuning elements to improve accuracy and simplify calculations. It is argued that this technique is the most reliable thus far described. Test results are given on a fairly large number of sample model varactors. The cutoff frequency, measured at X-band, varies from 50 to 80 kMc for units with zero-bias capacitance less than 2 uuf, down to 30 kMc for units with zero-bias capacitance of 5 uuf. (Author)

Microwave Lab., Stanford U., Calif.
AN IMPROVED PULSE TRANSFORMER FOR HIGH-VOLTAGE APPLICATIONS, by T. F. Turner. Technical rept. on Contract Nonr-225(48). May 59, 16p. 2 refs. M. L. no. 609.
Order from LC mi$2.40, ph$3.30 PB 146 225

Economy often dictates the use of a very low impedance network and step-up ratios of as much as 20 or 30. Transformers for such service are expensive to construct, and they deteriorate the pulse shape. In addition, the additional energy dissipated during the long rise and decay times required to obtain high step-up ratio and a reasonably flat top portion of the pulse requires a large investment in line storage capacitors and, of course, increases the operating cost. The transformer design described below substantially reduces the leakage inductance and at the same time reduces the total size and amount of core material required for a given high-voltage transformer.

PARAMETRIC REFRIGERATION: A MECHANISM FOR REMOVAL OF NOISE FROM THE SLOW WAVE OF AN ELECTRON BEAM, by P. A. Sturrock. Scientific rept. no. 16 on Contract AF 19(604)1930. Oct 59, 22p. 15 refs. M. L. Rept. no. 656; AFCRC-TN-59-974. AD-231 894.
Order from LC mi$2.70, ph$4.80 PB 145 766

Reasons for believing it to be impossible to remove the noise power from the slow wave of an electron beam are reviewed and found not to be cogent. A method for effecting this removal is proposed. Noise is first removed, by conventional techniques, from a band of fast waves; an appropriate parametric coupling, by means of an applied pump wave, between this band of fast waves and a band of slow waves then leads to a spatially periodic exchange of excitations between these waves so that one may transfer the noise which will be present on the slow waves to the fast waves. There are no obvious modes of instability in this process. By an appropriate choice of frequencies, the slow wave may be cooled to a temperature below the initial temperature of the fast wave: this device therefore constitutes a "parameter refrigerator". (Author)

HIGH POWER MICROWAVE SWITCH, by S. J. Tetenbaum. Quarterly progress rept. no. 3, 16 Dec 58-15 Mar 59, on Contract DA 36-039-sc-78044. 13 Apr 59, 38p.
Order from LC mi$3.00, ph$6.30 PB 145 809

High power measurements were performed on a helium-filled encapsulated window switch. Two forsterite tubes have been successfully constructed. The pyroceram cement sealing technique works excellently. A number of techniques were investigated for employing synthetic mica, a readily machinable material, in tube construction. Satisfactory final designs for the electromagnet and switching power supply have been achieved, and both are being constructed. (See also PB 142 762)

Microwave Physics Lab., Sylvania Electric Products, Inc., Mountain View, Calif.
INVESTIGATION OF THE USE OF ELECTRON CYCLOTRON RESONANCE TO OBTAIN MICROWAVE PHASE SHIFT, by H. Bandel, A. Penico and F. Olson. Scientific rept. no. 1 on Contract AF 19(604)2231. 2 Apr 58, 46p. 3 refs. Technical rept. MPL-11; AFCRC-TN-58-158; AD-152 391.
Order from LC mi$3.30, ph$7.80 PB 137 912

The feasibility of applying the dispersive properties of gas discharges near cyclotron resonance as the basis for developing electronically controllable microwave phase shifters has been investigated. Preliminary results indicate that it is possible to achieve a high figure of merit (phase shift per unit loss) over an appreciable range of phase shift by either magnetic field control or by electron density control.

Microwave Physics Lab., Sylvania Electric Products, Inc., Mountain View, Calif.
MIXING IN FERRITES AT MICROWAVE FREQUENCIES, by P. H. Vartanian and E. N. Skomal. Rept. on Contract DA 36-039-sc-73188. 7 May 57, 11p. 3 refs. Technical rept. MPL-5; AD-129 869.
Order from LC mi$2.40, ph$3.30 PB 145 880

Microwave mixing in ferrites is experimentally observed by subjecting a magnetized ferrite to two X band signals of differing frequency. Both sum and difference components are generated. A conversion efficiency for the sum frequency of -13 db was observed with a local oscillator power of 13 kw. The sum frequency output is observed to be linear with both signal and local oscillator inputs even when the two signals are of equal level. (Author)

SYNTHESIS OF INFINITE ZERO-POLE NETWORK STRUCTURES, by S. Deutsch. Rept. on Contract Nonr-839(05). 19 May 59, 35p. 11 refs. Research rept. R-739-59; PIB-667.
Order from LC mi$3.00, ph$6.30 PB 145 993

A desired amplitude or phase response that contains a "sharp corner" or slope discontinuity can be represented by an infinite number of zeros and/or poles in the s-plane. An approximation to the desired response can be achieved by rounding off the sharp corner and synthesizing the corresponding network structure. A different approach is suggested in this paper: (1) An exact analytic expression is given for the desired response; (2) the corresponding network is synthesized with the aid of infinite ladder structures. Synthesis of a ladder is carried out to a reasonable number of elements. An increased number of elements. An increased number of elements yields a better approximation to the desired response.

Moore School of Electrical Engineering, U. of Pennsylvania, Philadelphia.
MICROWAVE CRYSTAL DETERIORATION STUDIES, by P. P. Lombardini and R. J. Doviak. Quarterly progress rept. no. 3, 1 Feb-30 Apr 59, on Contract DA 36-039-sc-78055. 31 May 59, 39p. 8 refs. Moore School rept. no. 59-18; AD-225 424.
Order from LC mi$3.00, ph$6.30 PB 145 808

Recent investigations have shown that the whisker contact pressure must be standardized before any comparable measurements of temporary deterioration are made. The effect exists in both types of silicon. Tests performed on germanium p-n junction diodes at room temperature and at -180°C have shown no temporary deterioration effects.

MSA Research Corp., Callery, Pa.
STUDY OF ENERGY CONVERSION DEVICES, by R. E. Shearer. Quarterly progress rept. no. 1, 1 July-30 Sep 59, on Contract DA 36-039-sc-78955. 31 Oct 59, 31p. 11 refs. MSAR 59-119; AD-230 503.
Order from OTS $1.00 PB 161 690

Preliminary investigations were made into the development of energy conversion device converting thermal energy into electrical energy by means of thermal decomposition of ionic hydrides followed by electrochemical recombination of the decomposition products on a cyclic and continuous basis. A closed cycle system was constructed on information obtained in earlier batch-type cells. It was based on lithium hydride in the molten eutectic of the chloride and fluoride of lithium. Only 270 mv was obtained with one atmosphere of hydrogen pressure prior to regenerative operation and a peak of only 30 mv was obtained regeneratively. These values are susceptible to improvement by improved cell design and higher temperature operation of the regenerator, which was held to the range of 1300 to 1400 F because of limitations imposed by materials of construction. Construction of an improved regenerative system was undertaken on the basis of information developed with the first system. Differential thermal analysis on temperature changes of the eutectic of the ternary salt system LiI-LiCl-LiF shows a eutectic temperature in the range of 395 to 420°C compared with 485°C for the binary eutectic of LiCl-LiF. In one test on a batch-type cell with a potassium anode and the eutectic of KCl-LiCl as solvent, an open circuit voltage of 0.33 was obtained with the cell at 710°C. The information developed above gives background for improved regenerative operation with lower melting solvents, different anode material or higher temperature operation. (Author)

EVALUATION OF TRANSMITTING BEAM PENTODE TYPE PL-177A, by R. L. Norton. Final rept. for 1 Dec 57-31 Dec 58 on Contract DA 36-039-sc-74978. [1959] 53p. AD-219 217.
Order from LCmi$3.60, ph$9.30 PB 146 014

Fifty-two type PL-177A 75-watt transmitting pentodes were tested to determine the normal range of electrical characteristics for this type. Ten tubes from this group were tested to determine mechanical characteristics. Twenty-one tubes from the group were subjected to 1000-hour life test at VHF. The results of the the tests are presented in tabular, graphical and histogram form. A proposed MIL-E-1 type specification for the PL-177A is given. (Author)

Philco Corp., Philadelphia, Pa.
RESEARCH AND EXPERIMENTAL WORK ON MICROWAVE TRANSISTORS, by W. C. Follmer, M. M. Fortini and others. Quarterly progress rept. no. 5, 15 Jan-15 Apr 59, on Contract DA 36-039-sc-74988. [1959] 27p. 51 refs. Philco no. H-2153-5; AD-225 036.
Order from LC mi$2.70, ph$4.80 PB 145 877

Transistor action in depletion-layer devices was achieved when the bias on the injecting probe is more positive than the floating potential is negative. The fabrication work was concerned principally with the development of techniques for forming contacts to high-resistivity p-type silicon. Best results were obtained with a pressure-bonding technique that uses titanium-aluminum foil as the tab material. Fabrication and testing of germanium depletion-layer devices has continued.

ANTENNA SYSTEM FOR AIRBORNE X-BAND BEACON, DEVELOPMENTAL MODEL, by Thomas C. Cahill. Final technical rept. for 14 Apr 58-30 June 59 on Contract DA 36-039-sc-75018. 30 June 59, 47p. 1 ref. P&B Pub. no. 541; AD-225 118.
Order from LC mi$3.30, ph$7.80 PB 145 957

Report covers design and development of an antenna system for an airborne X-band beacon to be used on the RP-71 drone or equivalent aircraft. A study of radiation patterns of antennas mounted on various parts of the drone showed that a single antenna was inadequate. Tests with two identical, equally powered, antennas proved satisfactory. Transmission line problems were solved by the use of Phelps-Dodge Foamflex cable with modified connectors for the upper antenna and RG9B/U cable for the lower. The system is made up of two discone radiators, two Teflon radomes, a power divider, and upper and lower transmission lines. The system, its relative position in the drone, and the three major planes of the aircraft are illustrated. A series of radiation patterns, recorded through the planes (yaw, roll, and four angles of pitch) at frequencies of 8500, 9100, and 9600 megacycles, show that the system omnidirectionally covers the frequency range required within the limits of the specifications. Other graphs show that the system and its components meet the limit for VSWR characteristics. (Author)

Psychological Lab., Johns Hopkins U. [Baltimore, Md.]
SIGNAL MARK SIZE AND VISIBILITY OF RADAR SIGNALS ON A PLAN POSITION INDICATOR, by N. R. Bartlett and S. B. Williams. Rept. on Systems Research, Contract N5ori-166(01). 20 Sep 47, 18p. 3 refs. Rept. no. 166-1-30.
Order from LC mi$2.40, ph$3.30 PB 137 809

Preliminary research on the detectability of signal images on a 7BP7 radar screen indicates the extreme importance of the image size. Image size was varied (1) by regarding the radar screen from different distances, (2) by changing the length of the image by widening the azimuth gate, (3) by changing the thickness of the image by switching to different presentation range scales and (4) by moving the signal from the center to the periphery of the screen. Image size variations by such methods can change the strength of the minimum visible signal by at least eight or ten decibels. The data are preliminary, for equipment limitations did not permit variations from a signal pulse length of two microseconds nor reductions in azimuth gate below 12 degrees. Further research on the problem of image size with refined equipment is now in progress. (Author)

Radio Corp. of America, Lancaster, Pa.
ELECTRON TUBE MATERIALS, GASES, AND GETTERS, by J. C. Turnbull and G. P. Kirkpatrick. Quarterly progress rept. no. 2, 15 Jan-15 Apr 59, on Contract DA 36-039-sc-78226. 15 May 59, 163p. 134 refs. AD-220 824.
Order from LC mi$7.80, ph$25.80 PB 145 805

Surveys on the state of the art on outgassing techniques and on getter techniques and materials used in making electron tubes are included. Measurements are given of the thermal outgassing of nickel, cold rolled low carbon steel and nickel plated steel, on heating these materials to 1000°C. Results are summarized as follows: (a) For all materials, carbon monoxide is the predominant gas evolved with smaller quantities of carbon dioxide, nitrogen and hydrogen;

(b) Nickel shows lower gas levels than steel, while nickel plated steel resembles nickel more than steel in high temperature outgassing performance; (c) Vacuum melted nickel shows the same gas levels as air melted nickel, for the particular lots tested; and, (d) Comparing thicker (0.020") versus thinner (0.005") strip from the same vacuum melted nickel ingot, the thicker material shows, per unit area of sample, the same or lower gas levels. ALGEBRAIC DECODING FOR A BINARY ERASURE CHANNEL, by M. A. Epstein. Doctoral thesis. Rept. on Contract DA 36-039-sc-64637. 14 Mar 58, 15p. 10 refs. Technical rept. 340; AD-208 649.
Order from LC mi$2.40, ph$3.30 PB 145 780

This paper presents an optimum decoding procedure for parity check codes that have been transmitted through a binary erasure channel. The erased digits are decoded by means of modulo 2 equations generated by the received message and the original parity check equations. Most previous decoding procedures required a number of computations that grew exponentially with code length. At best, the required number of computations grew as a polynomial of code length. The decoding procedure for convolution parity check codes presented here will decode with an average number of computations per digit that is bounded by a finite number, which is independent of code length, for any rate less than capacity. ANALYSIS OF CIRCUITS WITH MULTIPLE-HOLE MAGNETIC CORES, by Lubomyr S. Onyshkevych. Master's thesis. Rept. on Contract DA 36-039-sc-64637. 9 July 57, 67p. 47 refs. Technical rept. 329; AD-214 554.
Order from LC mi$3.90, ph$10.80 PB 145 779

Multiple-hole magnetic cores, also called transfluxors, which have been developed recently, promise to be very useful in computer, control, and other logical circuitry. They are ferrite cores, with square hysteresis loops, of various complicated geometries. In this report, a workable analysis procedure for circuits that contain transfluxors is developed; it is based on the square-waveshape approximation. This analysis forms a basis for a design procedure. Sample circuits were designed and tested, and the results were found to be within 10 per cent of the predicted values. The main problems in circuit design were flux division and loading effects. Diode elimination presented another problem, which is treated at some length in this report. Diodeless operation of a transfluxor circuit was found to be possible, but slow, unreliable, and critical. In the field of logical design, a symbolic notation was developed, and an approach to design was made, using "gate boxes." A description of the physical properties of transfluxors is given; it includes some new, unpublished, special effects encountered with multiple-hole cores. (Author)

THEORY OF THE ANALYSIS OF NONLINEAR SYSTEMS, by Martin B. Brilliant. Doctoral thesis. Rept. on Contract DA 36-039-sc-78101. 3 Mar 58, 60p. 15 refs. Technical rept. 345; AD-216 209.
Order from LC mi$3.60, ph$9.30 PB 146 001

A theory of the analysis of nonlinear systems is developed. The central problem is the mathematical representation of the dependence of the value of the output of such systems on the present and past of the input. It is shown that these systems can be considered as generalized functions, and that many mathematical methods used for the representation of functions, of a real variable, particularly tables of values, polynomials, and expansions in series of orthogonal functions, can be used in generalized form for nonlinear systems.

DESIGN OF A QUASI-DOPPLER UHF DIRECTION FINDER (RADIO DIRECTION FINDER AN/GRD-11), by Richard C. Benoit, Jr., Francis Coughlin, Jr. and Stanley Kraszewaski. Nov 59, 31p. RADC-TR-59-106.
Order from LC mi$3.00, ph$6.30 PB 145 851

This report describes the design of Radio Direction Finder AN/GRD-11, a medium-aperture, quasi-Doppler direction finder operating in the frequency range of 225 to 399.9 mc. Contemporary techniques are compared to the quasi-Doppler technique, with respect to accuracy, reliability, susceptibility to site errors, and over-all system performance. The equipment developed is described and compared to existing direction finders. It is shown that the AN/GRD-11 provides a stable, fast-response bearing which is more reliable and more accurate than that obtained with contemporary, narrow-aperture, uhf D-F equipments.

Rome Air Development Center, Griffiss AFB, N. Y.
EVALUATION OF THE "M" TYPE CARCINOTRON FOR COMMUNICATIONS, by Ralph W. Mifflin and Joseph W. Ferguson. Feb 60, 16p. 1 ref. RADC-TN-60-30.
Order from LC mi$2.40, ph$3.30 PB 146 430

An "M" type carcinotron, backward wave power oscillator type CM 252, was delivered to RADC for evaluation for communication purposes. This tube is evaluated and problems in frequency stabilization are described. The use of this tube for quantized frequency modulation systems is indicated. Tests performed and their results are discussed. (Author)

STUDY OF SEALED NICKEL-CADMIUM BATTERIES, by Irwin M. Schulman and Paul Ritterman. Quarterly rept. no. 2, 1 Mar-31 Mar 59, on Research investigations to develop and evaluate a nickel cadmium battery having a hermetically sealed construction, and to study its reaction mechanisms. Contract DA 36-039-sc-78249. [1959] 53p. 8 refs. AD-225 160.
Order from LC mi$3.60, ph$9.30 PB 145 802

Forty-eight cells with varying concentrations and amounts of electrolyte were started on a life cycling program. The capacity data is reported. A new experiment was designed to test the effects of cobalt addition to the positive plates, lithia addition to the electrolyte, and varying negative/positive capacity ratios. There are general indications that the rate of recombination of oxygen with the negative plate is a function of the mole fraction rather than the partial pressure of oxygen when using a mixture of nitrogen and oxygen.

South Carolina U., Columbia.
APPLICATIONS OF A DIELECTRIC SHEET HALF-REFLECTING MIRROR AT MILLIMETER WAVELENGTHS, by R. G. Fellers. Rept. on Contract AF 18(603)43. 2 Jan 60, 21p. 3 refs. AFOSR-TN-60-14.
Order from LC mi$2.70, ph$4.80 PB 145 789

A free-space transmission system has been investigated as a possible low-loss replacement for waveguide over within system distances. In the use of such a scheme, it is necessary to devise the free-space equivalent of a number of waveguide components including the magic-tee, the wavemeter, the standing wave indicator and the duplexer. A dielectric sheet of appropriate thickness can be made to act as a half-silvered mirror and hence to serve the purpose of a magic-tee or three decibel directional coupler. Using this unit, a duplexer can be constructed and a Michelson interferometer can be built which will perform the functions of a wavemeter and a standing wave indicator.

Stanford Research Inst., Menlo Park, Calif.
BEACON ANTENNAS FOR DRONE AIRCRAFT USED AT WHITE SANDS MISSILE RANGE, by John B. Chown and Harold S. Rothman. Final rept., Task III, on Contract DA 36-039-sc-71205. Feb 59, 41p. 5 refs. AD-225 013.
Order from LC mi$3.30, ph$4.80 PB 145 942

An investigation was made of the general nature of problems associated with low-angle tracking of beacon-equipped aircraft and drones at WSMR. The investigation was made in two main parts. First, low-angle tracking was studied to determine the important limitations of the presently available tracking equipment and to ascertain where significant improvement in system performance can be made. Second, the airborne antenna was considered, to determine the proper location of the antennas on the aircraft to obtain the desired radiation patterns. Sufficient data are provided to select satisfactory antenna locations without the necessity of making extensive radiation pattern studies. (Author)

Stanford Research Inst., Menlo Park, Calif.
AN EXAMINATION OF BACKSCATTER PROPAGATION BETWEEN BOZEMAN, MONTANA AND PALO ALTO, CALIFORNIA, by Russell T. Wolfram. Scientific rept. 1 on Contract AF 19(604)5571. Jan 60, 23p. 4 refs. AFCRC-TN-60-120; AD-232 605.
Order from LC mi$2.70, ph$4.80 PB 146 013

Non-great-circle, ground backscatter, radio propagation paths between Bozeman, Montana, and Palo Alto, California, were studied by means of a radio scanning and direction-finding system operating at 33 Mc. The system utilized a 1.5-kw, FM transmitter at Bozeman and receiving and recording equipment at Palo Alto. Rotating directional antennas were used at both stations to determine the bearings of paths over which signals were propagated. During the observing period great-circle propagation along the 1200 km path was negligible, but strong signals were received over two 5000-km, two-hop paths, one to the east and one to the northwest of the stations, almost every day, averaging seven to eight hours per day. (Author)

Stanford Research Inst., Menlo Park, Calif.
RESEARCH INVESTIGATIONS OF BEACON-TRACKING ANTENNAS FOR AEROBEE-HI AT WHITE SANDS MISSILE RANGE, by Harold S. Rothman. Final rept., Task IV, on Contract DA 36-039-sc-71205. June 59, 43p. 10 refs. AD-220 021.
Order from LC mi$3.30, ph$7.80 PB 145 937

A two-part investigation was made of the general nature of problems encountered in tracking the Aerobee-Hi missile at White Sands Missile Range. First, a system analysis was made of the response and interrogation function to determine the limitations of the present tracking equipment and to ascertain where significant improvement in system performance can be made. Second, a study was made to determine what antennas that were suitable for missile installation would provide the desired radiation patterns. The region of reliable tracking can then be determined from the allowable airborne equipment complexity and the radar receiving system parameters. (Author)

Stanford Research Inst., Menlo Park, Calif.
A SUMMARY OF LITERATURE PERTAINING TO RADIO STUDIES OF METEORS AND METEOR TRAILS, by W. R. Vincent and Frances H. Smith. Final rept. on Contract AF 19(604)1517. Jan 60, 383p. 1447 refs. SRI Project 1422; AFCRC-TR-59-367; AD-231 809.

Order from LC mi$11.10, ph$59.10 PB 145 975

A comprehensive survey of the literature pertinent to radio studies of meteors is presented. An abstract is given of each article, paper, report, or book that was available in English. A separate list without abstracts is given of material published in the Soviet Union and in Eastern European countries. (Author)

Sylvania Research Labs., Bayside, N. Y.
WIDEBAND OSCILLATOR TUBES, by J. A. Noland. Final rept. on Contract DA 36-039-sc-73147. 30 Apr 59, 31p. 2 refs. TR 59-1795.1, formerly YD 57-3, AD-225 215.
Order from LC mi$3.00, ph$6.30 PB 145 940

The design and constructional details of K-band backward wave oscillators are presented. These tubes are of all metal and ceramic construction and may be operated in a permanent magnet focusing field. One sample tube was built for each of the desired tuning ranges, 15 to 24, 27 to 41 and 24 to 38 kMc. Experimental data obtained on these tubes is presented. (Author) (See also PB 140 598)

Technische Hochschule, Darmstadt (West Germany).
RESEARCH ON PULSED IMAGE CONVERTER TUBES, by Otto Scherzer. Technical rept. on Contract AF 61(514)439. 30 Mar 55, 28p. 1 ref. EOARDC-TR-54; AD-95 486.
Order from LC mi$2.70, ph$4.80 PB 146 284

To find the best way of building an image converter which can be used as an electron-optical shutter for estremely short exposure times, the advantages of electric and magnetic electron lenses are analysed and compared. While magnetic lenses yield better images, electric lenses can be operated with pulses of not rectangular shape. For reasons of intensity and of space-charge effects, the voltage must be the higher, the shorter the exposure time is. Yet the production of high-voltage pulses of extremely short duration and of exactly rectangular shape is extremely difficult and expensive. Therefore it looks much more promising to start the investigation with electric lenses.

Union Thermoelectric Corp., Forest Park, Ill.
ABRASIVE GRADING AND THE LAPPING OF QUARTZ OSCILLATOR PLATES, by Wallace E. Richmond and Ralph P. Chalker. Special rept. on Contract DA 36-039-sc-71061. 15 Apr 58, 47p.
Order from LC mi$3.30, ph$7.80 PB 145 885

The uniformity of commercially available abrasives of the grades most used in the quartz crystal industry falls short of that needed in order to insure uniform rates of stock removal, or surfaces of uniform and predictable finish. Microphotographs are used to illustrate. (Author)

Upper Air Lab., U. of Colorado, Boulder.
A MINIATURE TRANSISTORIZED RADIOMETER FOR MEASUREMENT OF VISIBLE AND INFRARED RADIATION FROM HIGH ALTITUDE VEHICLES, by Frank E. Stuart. Scientific rept. no. 1 on Contract AF 19(604)1899. Sep 58, 37p. 8 refs. AFCRC-TN-58-610; AD-209 220.
Order from LC mi$3.00, ph$6.30 PB 137 836

Two models of this radiometer have been developed: one for measuring integrated radiation from the ultraviolet to the near infrared, with a long-wavelength cut off of approximately 4.5 microns; the other for measuring integrated infrared radiation from approximately 4 microns to 30 microns, which includes the spectral region containing most of the thermal radiation from the earth. Three radiometers have been built and operated a combined total of several hundred hours. Tests on these instruments show them to be fairly rugged and foolproof. Various modifications of the optics and filter system will permit this instrument to be adapted to a variety of tasks in which the intensity being measured is not too low. (Author)

Varian Associates, Palo Alto, Calif.
RESEARCH ON MOLECULAR AND ATOMIC RESONANCE DEVICES, by J. C. Helmer. Quarterly rept. no. 8, 1 Apr-30 June 59, on Contract DA 36-039-sc-73266. [1959] 29p. 6 refs. Engineering rept. no. 218-8Q; AD-226 026.
Order from LC mi$2.70, ph$4.80 PB 146 016

The problem of forming molecular beams for use in ammonia masers is examined. It is shown theoretically and experimentally that through the use of a new type of parabolic focuser with a point source effuser, the molecular flow may be reduced by a factor of 8, for the same power output, or the power output may be increased by a factor of 2 for the same molecular flow. A theory of beam formation in a multitube effuser is described. This shows that the most intense molecular beam is formed by an effuser of small overall diameter. Design considerations are discussed for parabolic, upper-state focusers, and for coaxial, lower-state focusers. The operation of a system is described using a lower-state focuser and an ionization detector in which lower-state molecules produced by maser oscillation may be detected. (See also PB 145 234)

Willow Run Labs., U. of Michigan, Ann Arbor.
THE EFFECT OF SYMMETRICAL LIMITING ON A SIGNAL CONSISTING ON N DISCRETE FREQUENCIES, by Kit-Yin Tieng. Rept. on Project Michigan, Contract DA 36-039-sc-52654. Mar 59, 20p. 16 refs. Rept. no. 2144-416-R.
Order from LC mi$2.40, ph$3.30 PB 145 786

An expression is derived for the output of a symmetrical limiter, when the input signal consists of N discrete frequencies. The output is expressed as a double summation, each with an infinite number of terms. The amplitude of each frequency component can be found, although calculations may become involved. The two cases, where N = 2 and N = 3, are considered and expressions for the output are given which are readily adaptable to calculations.

Willow Run Labs., U. of Michigan, Ann Arbor.
SOME RESULTS ON NOISE THROUGH CIRCUITS, by William M. Brown. Memo. on Proj. Michigan,

Contract DA 36-039-sc-78801. May 59, 22p. 7 refs. Memo. no. 2900-17-R; AD-216 941.
Order from LC mi$2.70, ph$4.80 PB 145 997

The general zero-crossing problem is analyzed for nonstationary noise. The zero-crossing rate is calculated in detail for the nonstationary noise consisting of the sum of stationary Gaussian noise and the following determinate signals: video pulse train, sine wave, and triangular wave. Also, the following two properties of the envelope of noise are established: (1) the mean square output of an envelope detector is twice the mean square input (independent of the statistics of the input), and (2) the derivative of the envelope of stationary Gaussian noise has a Gaussian first probability distribution. (Author)

Willow Run Labs., U. of Michigan, Ann Arbor.
TRANSPORT OF NOISE AT MICROWAVE FREQUENCIES THROUGH A SPACE-CHARGE-LIMITED DIODE, by W. E. Vivian. Technical rept. no. 34 on Proj. Michigan, Contract DA 36-039-sc-7880 78801. Feb 60, 21p. 15 refs. Rept. no. 2900-112-T.
Order from LC mi$2.70, ph$4.80 PB 145 991

Several analyses of the transport of cathode shop noise through a space-charge-limited diode at microwave frequencies have been published to date. Each of these analyses has suffered from inconsistencies arising from assumptions of monovelocity perturbation flow, direct or reflected. A new method of analysis of diode flow eliminating this problem has been de veloped. Numerical results based on this method are presented here. Attention is restricted to the now classical problem of one-dimensional longitudinal confined flow. The magnitude and variation with distance of the so-called beam noise invariants is shown for a range of diode operating conditions. These calculated results, based for economy on an approximate static flow model, essentially substantiate the qualitative expectations suggested by prior analyses, and fit what few experimental data are available. The method of analysis employed in the calculation of the numerical results comprises a linear multistream formulation, based on representation or approximation of the perturbation particle density for the noise flow as a composite of singular impulse streams, N in number, along characteristic trajectories in the velocity-distance phase space. The resulting set of N ordinary linear differential equations which are coupled and of the first order, is solved by simultaneous numerical extrapolation. (Author)

ASKANIA CINE-THEODOLITE DATA REDUCTION MANUAL, by Eugene S. Smith. Rept. on Contract AF 08(606)1156. Jan 60, 146p. 26 refs. RCA Data Processing Technical rept. no. 56. AFMTC-TR-60-1.
Order from LC mi$7.20, ph$22.80 PB 146 762

The primary objective of this manual is to show how basic Askania Cine-theodolite data are obtained and utilized at AFMTC in determing the space coordinates of an object in flight. This manual is intended to be educational in view of the need for a reliable manual of Standard Operating Procedures to aid in training new employees in the procedures and techniques of theodolite data reduction. It is also intended to be a source of information for those agencies and individuals who utilize the reduced data by making the reduction procedures available to them.

Aircraft Armaments, Inc., Cockeysville, Md.
DEVELOPMENT OF AIRCRAFT CANOPY REMOVERS T14 AND T15, by Nicholas J. LaCosta. Rept. on Contract DA 36-034-507-ORD-50. Jan 57, 111p. 5 refs. Frankford Arsenal rept. no. R-1367; AD-129 784.
Order from LC mi$6.00, ph$18.30 PB 146 518

A report is made on the development of the T14 and T15 gas-fired aircraft canopy removers, and their performance is evaluated according to Frankford Arsenal specifications. The major improvements incorporated in the new removers were an aluminum firing pin and its shear pin, a modified locking arrangement, and silicone-rubber seals. The performance of both removers was consistent and exceeded the minimum characteristics put down by the Frankford Arsenal specification. Both removers are suitable for standardization. Studies and tests incidental in the investigation indicated that a 2-tube remover is possible which is capable of a performance equal to or greater than either of the 2 removers tested.

Army Ordnance Human Engineering Labs., Aberdeen Proving Ground, Md.
AN EVALUATION OF OBSERVER ERRORS IN SPOTTING ROUND FIRE CONTROL, by Robert T. Gschwind. Mar 60, 22p. Technical Memo. 4-60.
Order from LC mi$2.70, ph$4.80 PB 146 159

A field investigation was conducted at Aberdeen Proving Ground, Maryland to measure human errors associated with spotting round fire control. Ten mortar observers from Ft. George G. Meade were used to direct fire of a 60mm mortar at each of five 8' x 8' vertical targets randomly positioned within the range of the weapon. They were allowed 5 rounds to adjust fire and were instructed to call on target when they thought a round fell within 25 yds. of the

target. Nearly all the subjects thought they had determined the range after 5 rounds, however the distribution of range error when calling on target had an average deviation from the target of 7% of the range of the target. (Author)

Army Signal Research and Development Lab., Fort Monmouth, N. J.
DEVELOPMENT AND RESEARCH OF AN AUTOMATIC BALLISTIC WIND DISPLACEMENT COMPUTER, by Robert J. Franklin. 10 Oct 58, 91p. 13 refs. USASRDL Technical rept. 1990; AD-212 479.
Order from LC mi$5.40, ph$15.30 PB 145 752

The automatic ballistic wind displacement computer predicts the wind displacement of the landing point of ballistic rockets in miles from the theoretical "no wind" impact point. These predeterminations are made with an automatic continuous computer using single theodolite techniques and yield a digital display of rectangular coordinate components of ballistic wind displacement for pilot balloon runs of up to 6 min. duration. With the balloon release mechanism the theodolite tracker can readily perform all necessary operations to effect a computation. Some of the possible variations in operation, output data and accuracy are indicated. (Author)

Ballistic Research Labs., Aberdeen Proving Ground, Md.
THE DYNAMIC TESTER, by Robert H. Brunelle. June 59, 13p. Technical note no. 1261.
Order from LC mi$2.40, ph$3.30 PB 145 728

The Dynamic Tester is used in testing other devices, such as a fire control system, under realistically simulated dynamic conditions. Predetermined data, simulating a target in motion, are entered into the Tester on magnetic tape; and the test system's response is compared automatically against desired results based on the input data.

Defense Metals Information Center, Battelle Memorial Inst., Columbus, Ohio.
REVIEW OF PROBLEMS IN USING FLAT-ROLLED MATERIALS IN AIR- AND SPACE-WEAPON SYSTEMS, by F. W. Boulger. 14 Apr 60, 23p. 12 refs. DMIC memo. 52.
Order from OTS $0.50 PB 161 202

It has been estimated that, within 5 years, materials will be expected to operate at 1200 F for reasonably long times and at or above 2000 F for a few minutes. Within 10 years, operational temperatures are expected to reach 2500 F for a few minutes and 4000 F for a life of a few seconds. Therefore, this review deals mainly with problems in producing and using sheet materials intended for service at high temperatures.

Diamond Ordnance Fuze Labs., Washington, D. C.
HONEST JOHN HOB SELECTOR, by W. Hunter Boyd. 15 Dec 59, 19p. Technical rept. TR-794; AD-231 403.
Order from LC mi$2.40, ph$3.30 PB 146 078

The Honest John missile employs a device known as the HOB selector, the purpose of which is to allow the fuze to be manually preset to function at different settings for desired results. The present model of this device has undergone preservice testing in which its setting mechanism proved to be unreliable. To overcome the defects observed during these tests, DOFL has redesigned this HOB and constructed prototypes for production. The details to the redesign are described. The features of this design incorporated in prototype models of HOB's for the LaCrosse and Littlejohn missiles are briefly discussed. (Author)

MAGNITUDE OF IN-FLIGHT VIBRATION OF THE T2078E1 FUZE ON THE M31 ROCKET, by W. Gaylord. 11 Jan 60, 21p. TR-801; AD-232 435.
Order from LC mi$2.70, ph$4.80 PB 146 226

Four instrumented fuze housings were flight tested at Yuma Test Station, Arizona. The flights were conducted to obtain data relevant to the shock and vibration input environment of the T2078E1 fuze on the M31 rocket. The analyzed data show that the Honest John fuze housing experiences low-frequency input vibration of 30 to 500 cps and acceleration levels below 40 g for short periods during launch and burnout. The vibration which occurred during the remainder of flight did not have sufficient magnitude to be distinguished from noise. (Author)

RADIATION DAMAGE OF DC-TO-DC POWER CONVERTERS, by Paul A. Trimmer and Louis DeLuca. 29 Jan 60, 13p. 4 refs. Technical rept. TR-792; AD-232 333.
Order from LC mi$2.40, ph$3.30 PB 146 080

Semiconductor devices normally used in the dc converter of the T3022E1 fuze system were exposed to neutron radiation up to 0.7×10^{13}nvt from the Godiva bare critical assembly. Measurements of their characteristics were made before and after irradiation. The current gain (β) of the transistors was reduced by the neutron radiation to the extent that they would not function properly in the circuit. This was corrected by adding a biasing resistor to the base circuit of one of the transistors. The results of this study indicate that this unit will then operate reliably after being exposed to neutron radiation up to 0.7×10^{13}nvt. (Author)

PREVENTION OF EXUDATION FROM AMMUNITION ITEMS, by Robert W. Heinemann and Stanley J. Lowell. Feb 60, 13p. 5 refs. Technical rept. 2675.
Order from LC mi$2.40, ph$3.30 PB 144 633

The problem of preventing exudation has been intensively investigated in the last few years. The investigation has proved that exudation can be prevented by either incorporating a calcium silicate absorbent (Spec X-PA-PD-1659) into the explosive filler or placing the same absorbent on top of the explosive filler. Results of tests conducted with T34E2 warheads show that incorporating the absorbent into the explosive filler is the better of the two techniques studied. Further, an amount of absorbent equal to 1.25% of the TNT content is needed to prevent exudation from TNT-containing explosives.

EXPERIMENTAL PLATING OF GUN BORES TO RETARD EROSION, by Vernon A. Lamb and John P. Young. May 60, 99p. 35 refs. Technical note no. 46.
Order from OTS $2.50 PB 151 405

Methods for plating the bores of gun barrels are described, including details of fixture design, solution composition, and operating conditions. Extensive firing tests were performed, which show that chromium plate increases the life of barrels about 2- to 5-fold, depending on the type and caliber of barrel. Optimum thickness of plate ranges from 0.0015 inch in the smallest calibers to 0.015 inch in cannon. Certain modifications of the barrels enhance the improvement provided by the chromium plate. Chromium plating has been adopted as standard production practice for caliber 0.30, 0.50, and 20 mm barrels, and for several calibers of cannon.

Naval Ordnance Lab., White Oak, Md.
THE HARMONIC GENERATION TECHNIQUE FOR THE DETERMINATION OF THERMAL CHARACTERISTICS OF WIRE BRIDGES USED IN ELECTRO-EXPLOSIVE DEVICES, by Louis A. Rosenthal. 9 Sep 59, 26p. NAVORD rept. 6691. AD-231 918.
Order from LC mi$2.70, ph$4.80 PB 146 252

The thermal equations for a wire bridge or equivalent electro-explosive device are presented. When a sinusoidal current passes through such a thermally sensitive resistance, it is capable of generating a third harmonic voltage which is a measure of the resistance's ability to follow the instantaneous cycling power fluctuations. By measuring the variation of this third harmonic with frequency it is possible to determine the thermal time constant with good accuracy. The heat equations are also verified. Confirming experimental data are presented. (Author)

NOTS SUPERSONIC TRACKS, by Frank H. Haymaker. 1 July 58, 41p. NOTS rept. no. 1938; AD-200 540.
Order from LC mi$3.30, ph$7.80 PB 146 057

This booklet is written expressly to acquaint potential users with the testing services and facilities available at the NOTS supersonic tracks. The facts presented here should materially shorten the time between the developing agency's realization that a testing problem is forthcoming and the acquisition and assessment of the test data.

Naval Research Lab., Washington, D. C.
RADIOMETRIC BEHAVIOR OF HIGH EXPLOSIVES AT REDUCED PRESSURE, by M. Cavanagh and A. Rockman. Final rept. 15 Feb 60, 9p. 2 refs. NRL rept. 5432.
Order from LC mi$1.80, ph$1.80 PB 143 941

Radiometric measurements of exploding pentolite at sea-level atmospheric pressure and at simulated altitudes of 50,000 and 100,000 feet were made at the U. S. Naval Ordnance Laboratory using a ballistic thermopile and a high-speed streak camera. At 50,000 feet, an unexpected maximum of total thermal radiation was encountered. This is higher by a factor of 10 than the total thermal radiation measured at sea level and higher by a factor of 2 than the yield measured at 100,000 feet. While this phenomenon is real, it is unexplained. (Author)

PROPERTIES OF EXPLOSIVES OF MILITARY INTEREST, by W. R. Tomlinson, Jr. rev. by Oliver E. Sheffield. Apr 58, 363p. 331 refs. Technical rept. no. 1740, rev. 1.
Order from LC mi$11.10, ph$54.60 PB 145 974

The 81 explosive compounds or mixtures and their properties - including composition variations for a given type - were selected for inclusion in this manual because of their current or future interest or due to past or present application in military items. The tabulated data reflect the results of tests which measure sensitivity to friction, impact, heat, initiation; performance characteristics or effectiveness in weapons; and physical and chemical properties of the explosive. A method of preparation, synthesis or manufacture is included for each type of explosive.

APPLICATION OF FRACTURE MECHANICS TO RECOILLESS RIFLE PROBLEMS, by C. M. Carman. Sep 59, 31p. 15 refs. Rept. R-1521; AD-231 923.
Order from LC mi$3.00, ph$6.30 PB 146 003

The principles of fracture mechanics are briefly reviewed. Included in this review are the equations for circumferentially notched bars in tension, centrally notched sheet specimens in tension, plastic strain zone correction, conditions for plain strain fracture, and maximum flaw size with its practical limitations. Fracture toughness values for 433OV (Mod + Si) steel, Vasco-Jet 1000 steel, and 300-M steel have been determined, using circumferentially notched specimens. These values have been corrected for plastic strain zone, analyzed for plain strain conditions, and used to determine maximum flaw size. (Author)

Rock Island Arsenal Lab., Ill.
STABILITY OF HARD ELECTRODEPOSITED CHROMIUM, by J. W. McGarvey. 20 Nov 59, 23p. 6 refs. Rept. no. 59-2989; AD-231 485.
Order from LC mi$2.70, ph$4.80 PB 145 894

Several samples of hard electrodeposited chromium were studied utilizing X-ray diffraction, light microscopy, and electron microscopy to determine if any structural modifications could be detected in aged specimens. All of the deposits examined were found to be in the normal body-centered cubic form and exhibited no detectable modifications after aging at normal atmospheric temperatures. Heat treatment at 450 F did not affect the body-centered cubic form of the deposits although it did widen the cracks which were present.

ON SHIP FORMS HAVING MINIMUM WAVE RESISTANCE, by Samuel Karp, Jack Kotik, and Jerome Lurye. Scientific rept. on 1 on Contract Nonr-2427(00). 20 Mar 59, 60p. 16 refs. Rept. on TRG-119-SR-1.
Order from LC mi$3.60, ph$9.30 PB 145 793

In the present paper, which deals with the strut of minimum wave resistance, this difficulty is resolved by formulating the problem in a manner different from usual. The reformulated problem is then shown to have a unique solution in the form of a minimizing hull shape which, while not precisely a strut, is nevertheless very closely related to one in two ways: (1) to the first order in some parameter expressing the thinness, e.g., the width at the midsection, the minimizing shape is a strut, and (2) the shape approaches a strut asymptotically for large depths. Associated with the process of obtaining this solution are several mathematical steps which are still to be justified rigorously, but provisionally they appear correct.

OCCURRENCE OF HIGH TEMPERATURES IN YUMA STORAGE DUMPS, by William L. Porter and Nico H. Roos. Nov 59, 72p. 15 refs. Technical rept. EP-121; AD-231 917.
Order from LC mi$4.50, ph$12.30 PB 146 064

Temperature in 4 differently protected storage-dump stacks were studied under extreme hot-dry conditions on desert terrain at Yuma, Arizona, during a 43-day period. Carton air and food temperatures were recorded in stacks exposed in the following ways: (1) open and unprotected; (2) protected by a raised paulin fly; (3) protected by a tightly-lashed paulin; and (4) protected by a raised paulin fly with addition of reflective foil laid on the stack surface. In both extremes and means of temperature, the tightly-covered paulin stack is a much more severe storage environment than the other three types observed, which differ little among themselves in long-term storage stress. In these three stacks, those having greater stack protection showed a reduction in maximum temperatures, range of temperature and duration of higher temperatures, but effective storage temperatures were similar. Mean storage temperature tended to rise with increased airmass moisture, because daily minimum temperatures were raised by back radiation from water vapor and the prevailing thin, high, nocturnal cloudiness.

Texas Agricultural Experiment Station, College Station.
A LONG RANGE INVESTIGATION OF THE NUTRITIONAL PROPERTIES OF IRRADIATED FOOD, by L. R. Richardson. Progress rept. for 1 Sep 54-1 Jan 55 on Contract DA 49-007-MD-582. [1955] 8p.
Order from LC mi$1.80, ph$1.80 PB 146 663

Three studies were started September 1, 1954. These were: (1) A study of the effect of an irradiated diet of the mother on the offspring. (2) A longevity study to determine whether irradiation of a food affects of the life span of an animal. (3) A study of the effect of irradiation of the diet on its folic acid content using chicks as the experimental animals. The results obtained are described in this progress report. Rats were used in (1) and (2).

Texas Agricultural Experiment Station, College Station.
A LONG RANGE INVESTIGATION OF THE NUTRITIONAI PROPERTIES OF IRRADIATED FOOD, by L. R. Richardson. Progress rept. 2, 1 Sep 54-1 Apr 55, on Contract DA 49-007-MD-582. [1955] 8p.
Order from LC mi$1.80, ph$1.80 PB 146 664

All data obtained since this project was initiated in September 1954 are given in this report. The effect of an irradiated diet of the mother on the offspring. Observations on the first generation. Incidence of blindness in offspring of mothers receiving various diets. Effect of an irradiated diet on the growth and life span of rats. An irradiated diet and the growth of chicks. An irradiated diet, the survival of chicks, and hematocrit value. (See also PB 146 663)

Texas Agricultural Experiment Station, College Station.
A LONG RANGE INVESTIGATION OF THE NUTRITIONAL PROPERTIES OF IRRADIATED FOOD, by L. R. Richardson. Progress rept. 3, 1 Sep 54-1 July 55, on Contract DA 49-007-MD-582. [1955] 8p. AD-96 317.
Order from LC mi$1.80, ph$1.80 PB 146 668

All data obtained since this project was initiated in September 1954 are given in this report: The effect of an irradiated diet of the mother on the offspring; Observations on the first and second generations; A long range effect of an irradiated diet on reproduction rats - observations on litters; The incidence of blindness in offspring; Effect of an irradiated diet on the growth and life span; An irradiated diet and the growth of chicks; Folic acid content of tissues; Enzymes. (See also PB 146 664)

Texas Agricultural Experiment Station, College Station.
A LONG RANGE INVESTIGATION OF THE NUTRITIONAL PROPERTIES OF IRRADIATED FOOD, by L. R. Richardson. Progress rept. 4, 1 July-1 Oct 55, on Contract DA 49-007-MD-582. [1955] 14p.
Order from LC mi$2.40, ph$3.30 PB 146 667

All data obtained on reproduction and longevity studies with rats since this project was initiated in September 1954 are given in this report. The effect of an irradiated diet of the mother on the offstpring. Observations on the first, second and third generations. (See also PB 146 668)

Texas Agricultural Experiment Station, College Station.
A LONG RANGE INVESTIGATION OF THE NUTRITIONAL PROPERTIES OF IRRADIATED FOOD, by L. R. Richardson. Progress rept. 5, 1 Oct 55-1 Jan 56, on Contract DA 49-007-MD-582. [1956] 21p.
Order from LC mi$2.70, ph$4.80 PB 146 666

Four generations of rats receiving irradiated and untreated diets have been started in reproduction and longevity studies. As measured by the number and percent of young weaned, the irradiated diet is equal to the untreated diet for reproduction and lactation in the first and second generation, but inferior to the untreated diet in the third generation. With regard to life span, so far, the irradiated and untreated diet have been equal in nutritive value. Chicks receiving an irradiated diet supplemented with vitamins A, D and E consistently grew at a slightly slower rate than those receiving the untreated diet. When the complete diet was irradiated and was not supplemented with vitamins A, D and E, the chicks grew slowly and the mortality was high. Definite symptoms of vitamins A and E deficiency were evident. Studies carried out to determine the effect of irradiation on individual vitamins show that the vitamin K activity of menadione and vitamin K_5 was destroyed by irradiation at a dose of 3 X 10 rep. Choline was not affected by irradiation of the diet or by irradiation of a solution of choline. Endogenous respiration of liver homogenate from rats receiving an irradiated diet increased over 100 percent, but there was no significant change in the liver cytrochrome oxidase or liver xanthine oxidase. (See also PB 146 667)

Texas Agricultural Experiment Station, College Station.
A LONG RANGE INVESTIGATION OF THE NUTRITIONAL PROPERTIES OF IRRADIATED FOOD, by L. R. Richardson. Progress rept. 6, 1 Jan 56-1 Apr 56, on Contract DA 49-007-MD-582. [1956] 22p.
Order from LC mi$2.70, ph$4.80 PB 146 665

Observations on four generations of rats receiving irradiated and untreated diets have continued in reproduction and longevity studies. As measured by the number and percent of young weaned, the irradiated diet is essentially equal to the untreated diet for reproduction and lactation in the first and second generation. The irradiated diet has been slightly inferior to the untreated diet in the third generation. Females in the fourth generation which received either the irradiated or untreated diet have weaned a small percent of their young. However, there was no essential difference in the two diets. With regard to length of life, the irradiated and untreated diets are about equal in nutritive value. With regard to growth, the untreated diet is slightly superior to the irradiated diet in seven out of eight cases. The difference between the weights of males has been greater than that between the females. The males in first and second generations which received the irradiated diet appear to be loosing weight slightly faster than those receiving the untreated diet. Studies with chicks during the past three months have been chiefly to check some of the earlier trials. Observations agree with those given in Progress Report V and it is concluded that choline is not destroyed by irradiation of the diet. (See also PB 146 666)

Texas Agricultural Experiment Station, College Station.
A LONG RANGE INVESTIGATION OF THE NUTRITIONAL PROPERTIES OF IRRADIATED FOOD, by L. R. Richardson. Progress rept. 7, 1 Apr-1 July 56, on Contract DA 49-007-MD-582. [1956] 23p.
Order from LC mi$2.70, ph$4.80 PB 146 669

The percent of young weaned was less on irradiated diet. The number of young born per litter has been essentially the same in both groups. Rats have consumed approximately the same amount of diet in both groups. The incidence of blindness was slightly higher in young from the irradiated diet. Chicks receiving irradiated diets consistently grew at a slower rate than those receiving the untreated diet. Chicks receiving a solution which contained a mixture of thiamine, pyridoxine, riboflavin, pantothenic acid and folic acid, that had been irradiated, developed typical symptoms of thiamine and pantothenic acid deficiency when the solution was supplied at a low level. When the quantity supplied was in excess, the irradiated and untreated solutions were approximately equal. (See also PB 146 665)

Texas Agricultural Experiment Station, College Station.
A LONG RANGE INVESTIGATION OF THE NUTRITIONAL PROPERTIES OF IRRADIATED FOOD, by L. R. Richardson. Progress rept. 8, 1 July-1 Oct 56, on Contract DA 49-007-MD-582. [1956] 19p.
Order from LC mi$2.40, ph$3.30 PB 146 670

The observations on the rats are essentially the same as those given in Progress Report VII. The results with irradiated protein were variable, and definite conclusions were impossible with regard to specific effects of irradiation. Preliminary studies indicated that biotin activity of a diet or of a solution were not decreased by the irradiation procedure. (See also PB 146 669)

Texas Agricultural Experiment Station, College Station.
A LONG RANGE INVESTIGATION OF THE NUTRITIONAL PROPERTIES OF IRRADIATED FOOD, by L. R. Richardson. Progress rept. 9, 1 Oct 56-1 Jan 57, on Contract DA 49-007-MD-582. [1957] 16p.
Order from LC mi$2.40, ph$3.30 PB 146 671

The percent of litters and of young weaned in the four generations was slightly less on the irradiated diet. Twenty females in the irradiated group in the first and second generations produced a larger total number of young than the same number in the untreated.

The untreated group produced a large total number of young in the third and fourth generations. The number of young per litter was essentially the same in both groups. The incidence of blindness continued to be higher in young from females receiving the irradiated diet. Vitamins A and alpha tocopherol were destroyed when the complete diet was irradiated. There was some destruction of thiamine, riboflavin, pyridoxine, pantothenic acid and folic acid when a solution containing these vitamins was irradiated. A diet composed entirely of irradiated foods should be supplemented with a complete vitamin mixture in order to insure an adequate supply of vitamins. (See also PB 146 670)

Texas Agricultural Experiment Station, College Station.
A LONG RANGE INVESTIGATION OF THE NUTRITION PROPERTIES OF IRRADIATED FOOD, by L. R. Richardson. General progress rept. 12 (Progress rept. 4 on Long Term Feeding Study on Chicken and Green Beans) 1 Mar-15 Sep 58, on Contract DA 49-007-md-582.
Order from LC mi$2.70, ph$4.80 PB 146 849

Rats receiving various combinations of control and irradiated chicken and green beans have been observed in parent, F_1 and F_2 generation. Growth, fertility and reproduction, weights of organs, and hematological values were within normal of the rats receiving control and green beans and chicken or green beans and chicken irradiated at a dose level of 2.79×10^6 rad or 5.58×10^6 rad. It is concluded that irradiation at the two dose levels has not decreased the nutritive value of the green beans and chicken. A urinary discharge is prevalent in mature male rats and renal stones were found in kidneys and bladders of both male and female rats. The abnormalities were present in rats receiving the control green beans and chicken and therefore their presence is not attributed to irradiation of the food. A second test on the incidence of congential blindness shows that the incidence is still higher in the young from mothers receiving the irradiated than in those from mothers receiving the non-irradiated diet. Repeat tests with irradiated pork and beef fatty tissue confirm the observations described in earlier reports, that diets containing control beef fatty tissue could be stored for 3 weeks without serious loss in nutritive value. Diets containing control pork fatty tissue decreased in nutritive value. Preliminary tests indicated that prolonged prothrombin times developed in male rats receiving diets containing irradiated beef or diets containing untreated beef and oxidized cod liver oil or oxidized wheat germ oil. (See also PB 146 848)

Texas Agricultural Experiment Station, College Station.
A LONG TERM FEEDING STUDY ON CHICKEN AND GREEN BEANS, by L. R. Richardson. Progress rept. 1 on Contract DA 49-007-md-582. [1957] 9p. AD-144 188.
Order from LC mi$1.80, ph$1.80 PB 146 847

A study is being conducted on chicken and green beans irradiated at different dose levels. The gain in weight of individual male and female rats receiving these foods was recorded after 12 weeks. There was no difference between the rats that received the control diet and those that received any combination of the irradiated chicken and green beans. Hematological studies revealed no difference between the control rats and the test subjects.

Texas Agricultural Experiment Station, College Station.
A LONG TERM FEEDING STUDY ON CHICKEN AND GREEN BEANS, by L. R. Richardson. Progress rept. 2 on Contract DA 49-007-md-582. 31 Oct 57, 11p. AD-150 174.
Order from LC mi$2.40, ph$3.30 PB 146 848

Young have been produced by every female receiving the irradiated and control chicken and green bean diets in the reproduction study. A few males have not sired litters; however, the percentage of male siring litters in the irradiated group was higher than in the control group. Overall data obtained so far indicate that the nutritive value of the irradiated foods is essentially the same as that of the non-irradiated. (See also PB 146 847)

Vanderbilt U. School of Medicine, Nashville, Tenn.
LONG-TERM FEEDING EXPERIMENT ON IRRADIATED CHICKEN, BEEF AND JAM, by Frank R. Blood. Progress rept. no. 3-A, 13 June-15 Sep 58 on Contract DA 49-007-md-779. [1958] 13p.
Order from LC mi$2.40, ph$3.30 PB 146 822

The beagles have now been fed irradiated foods for thirty-six weeks. Diets containing 35% of solids of boned chicken, ground beef, and pineapple jam irradiated at 0-, 2.79- and 5.58 megarads have continued to be acceptable to all animals. Hematologic examinations performed at the close of this period reveal normal values for all dogs. Urine analyses done after thirty-six weeks continue to reveal that the dogs receiving the jam diet, which has a high sugar content, continue to have glycosuria. A negative Benedict and albumin test were obtained on all dogs on the chicken and beef diets. During the first nine months of feeding no other effects have been noted in any of the animals. (Author)

Vanderbilt U. School of Medicine, Nashville, Tenn.
LONG-TERM MONKEY FEEDING EXPERIMENT ON IRRADIATED PEACHES, WHOLE ORANGES AND PEELED ORANGES, TWELFTH TO TWENTY-FOURTH WEEK, by Frank R. Blood. Progress rept. no. 2-B, 14 Apr-12 July 58, on Contract DA 49-007-md-779. [1959] 15p.
Order from LC mi$2.40, ph$3.30 PB 146 824

The long-term feeding experiment with monkeys to determine the wholesomeness of irradiated peaches, whole oranges and peeled oranges has been continued as described in Progress Report No. 1 for Monkeys. Hematologic examinations made during the twenty-fourth week show normal values for hemoglobin, PCV and white blood cell count, but both the control and experimental animals have a high eosinophil count. However, an eosinophilia is present in most of the monkeys in the colony at Vanderbilt and does not

appear to be related to feeding diets containing irradiated foods. Other than the eosinophilia, the animals have appeared normal during the first six months of the experiment, with no effects directly related to the incorporation of irradiated foods in the diet. (Author)

Vanderbilt U. School of Medicine, Nashville, Tenn.
LONG-TERM MONKEY FEEDING EXPERIMENT ON IRRADIATED PEACHES, WHOLE ORANGES AND PEELED ORANGES, TWENTY-FOURTH TO THIRTY-SIXTH WEEK, by Frank R. Blood. Progress rept. no. 3-B, 12 July-12 Oct 58, on Contract DA 49-007-md-779. [1958] 15p.
Order from LC mi$2.40, ph$3.30 PB 146 821

Rhesus Monkeys receiving irradiated peaches, whole oranges and peeled oranges have been on experimental diets for thirty-six weeks. This long-term feeding experiment has been continued as described in Progress Reports No. 1 and No. 2-B for Monkeys. Hematologic examinations of these animals continue to show normal values. The eosinophil counts, which were found to be high after twenty-four weeks (Progress Report No. 2B), have returned to normal in all but one monkey in the group receiving peaches and show improvement in those monkeys receiving whole and peeled oranges. One monkey on X-level peeled oranges expired during this period from dysentry. No effects due to the toxicity of the irradiated foods have been noted. (Author) (See also PB 146 824)

Vanderbilt U. School of Medicine, Nashville, Tenn.
LONG-TERM RAT FEEDING EXPERIMENT ON IRRADIATED BEEF, TWELFTH TO TWENTY-FOURTH WEEK, by Frank R. Blood. Progress rept. no. 2C, 3 June-3 Sep 58, on Contract DA 49-007-md-779. [1958] 18p.
Order from LC mi$2.40, ph$3.30 PB 146 823

The long-term feeding experiment of irradiated beef to three replicates of rats to determine the wholesomeness of irradiated food stored 6 months at room temperature has been continued as described in Progress Report No. 1 for rats. Replicate No. 2B (rats receiving no vitamin supplements) has also been continued. During the first twenty-four weeks of feeding no effects related to the toxicity of the irradiated beef have been noted. (Author)

MACHINERY, FABRICATION, AND ACCESSORY EQUIPMENT

Engines and Propulsion Systems

Aerojet-General Corp., Azusa, Calif.
CHARGED-COLLOID PROPULSION SYSTEM, by R. D. Schultz and L. K. Branson. Rept. on Contract AF 49(638)656. Dec 59, 35p. 24 refs. Rept. no. 1728; AFOSR-TN-60-212; AD-230 620.
Order from LC mi$3.00, ph$6.30 PB 146 178

Theoretical and experimental research is described leading toward a space propulsion system in which microscopic oil droplets are produced with a high positive charge and accelerated electrostatically to exhaust velocities of over 50,000 miles per hour with a specific impulse of over 2200 seconds. This type of rocket system may prove to be of considerable value for controlling the orbit of an earth satellite, for earth-moon missions, and possibly for deep-space exploration such as a Mars or Venus probe. (Author)

Aerosciences Lab., General Electric Co., Philadelphia, Pa.
EXPERIMENTAL INVESTIGATIONS OF PLASMA ACCELERATORS FOR SPACE VEHICLE GUIDANCE AND PROPULSION, by Bernard Gorowitz, K. Moses, and P. Gloersen. Rept. on Contract AF 04(647)269. 23 Nov 59, 25p. 5 refs. Technical Information Series R59SD466. AD-230 770.
Order from LC mi$2.70, ph$4.80 PB 145 717

A description is given of experimental studies concerning the possible application of a pulsed plasma accelerating device for space propulsion and attitude control. The particular laboratory model discussed employs an electric discharge to create a plasma which is electromagnetically accelerated into a high vacuum chamber. Specific impulses obtained with the accelerator have been in the range of 1000-20,000 seconds. Measurements indicate efficiency of conversion of stored electrical energy to mechanical energy as high as 60%.

Armed Services Technical Information Agency, Arlington, Va.
ROCKET PROPELLANTS. Report Bibliography. Mar 60, 59p. 292 refs. AD-233 500.
Order from OTS $1.50 PB 161 654

The bibliography is a compilation of approximately 292 abstracts of unclassified reports on liquid and solid propellants which were added to the ASTIA collection from 1953 to 15 Feb 1960. The first part of the bibliography includes separate sections dealing with general information on solid rocket propellants and on liquid rocket propellants. The second part of the bibliography includes sections for each of the following compositions used in rocket propellants: (1) acetylenes, (2) amines, (3) ammonia, (4) ammonium perchlorate, (5) boron hydrides, (6) ethylene oxide, (7) fluorine, (8) hydrazines, (9) hydrocarbons, (10) hydrogen, (11) hydrogen peroxide, (12) lithium compounds, (13) methanol, (14) nitric acid, (15) nitrogen, (16) nitrogenfluorine compounds, (17) nitrogen oxides, (18) nitroparaffins, (19) oxygen, (20) ozone, (21) perchloryl fluoride, and (22) thiophosphites. Abstract entries in each subdivision of the first and second parts are arranged alphabetically by corporate author, numerically by contract number and by date. Only final or summary reports were included in the bibliography, except when the final report was not received or when a progress report contained significant information which was not included in the final report. A bibliography of confidential entries on solid and liquid propellants (AS-315 500) was compiled separately. (Author)

James Forrestal Research Center, Princeton, N. J.
PROJECT SQUID. Semi-annual progress rept. for 1 Oct 58-31 Mar 59 on Contract Nonr-1858(25). 1 Apr 59, 101p. 49 refs.
Order from LC mi$5.70, ph$16.80 PB 145 886

Covers work done in the following four fields: Fluid mechanics, transport and transfer processes, chemical kinetics, combustion phenomena. (See also PB 137 703)

Jet Propulsion Center, Purdue U., Lafayette, Ind.
EXPERIMENTAL INVESTIGATION OF HEAT TRANSFER BY FORCED CONVECTION FROM THE HOT GAS TO A COOLED STAINLESS STEEL RADIAL INFLOW GAS TURBINE ROTOR, by Thomas R. Swartwout. Final rept. on Contracts N7onr-394(15) and Nonr-1100(10). Jan 58, /8p. 22 refs. Rept. no. F-58-2; PRF 688 and 1499.
Order from LC mi$4.50, ph$12.30 PB 138 325

An investigation was made of the heat transferred by forced convection from the hot gases flowing through a 12.2 inch diameter radial in-flow turbine rotor fabricated from Universal-Cyclops A-286 alloy, to the cooling air flowing over the back surface of the rotor. The cooling air was injected near the tip of the rotor, flowed over the back surface of the rotor, and was discharged around the shaft. The turbine was operated with turbine inlet gas temperatures of 800 F, 1050 F, and 1200 F; pressure ratios of 1.5 to 1.8; and coolant ratios (weight rate of flow of cooling air/weight rate of flow of turbine gases) of 4 to 7 per cent; all experiments were conducted at a constant rotor speed of 16,000 rpm. The correlation of the heat transfer film coefficients for the hot gas side of the rotor previously developed at the Gas Turbine Laboratory, Purdue University, from experiments with lower turbine inlet temperatures was verified with the data obtained at the higher turbine inlet gas temperatures by employing a thermal analyzer based on the analogy between the flow of heat and of electricity.

Jet Propulsion Lab., Calif. Inst. of Tech., Pasadena.
THE SYNTHESIS OF RESIN INTERMEDIATES BY REACTIONS WITH ETHYLENE OXIDE, by Peter L. Nichols, Jr., John D. Ingham and others. Rept. on Contract DA 04-495-ORD-18. 16 Sep 54, 49p. 38 refs. Rept. no. 20-84.
Order from LC mi$3.30, ph$7.80 PB 146 856

The chemistry of the openings of the ethylene oxide ring has been studied from the viewpoint of developing synthetic methods for the preparation of new and useful propellant materials and their intermediates. Experimental conditions were chosen such that the ring openings proceeded by the familiar bimolecular nucleophilic substitution reaction. Acid-catalyzed and uncatalyzed additions were studied in both aqueous and nonaqueous media.

Plasma Propulsion Lab., Republic Aviation Corp., Farmingdale, N. Y.
SOME ENGINEERING ASPECTS OF THE MAGNETOHYDRODYNAMIC PINCH PROCESS FOR SPACE PROPULSION, by Irving Granet and William J. Guman. Rept. on Contract AF 49(638)552. Nov 59, 44p. 16 refs. PPL Rept. no. 120; AFOSR-TN-60-86.
Order from LC mi$3.30, ph$7.80 PB 145 841

This paper is divided into three sections: (1) A description of several analytical models currently in use to describe the pinch process, the approximations contained in each, and their limitations. (2) Based upon conclusions drawn from Section I, the "snow plow" (4) method was selected for a systematic analysis of a propulsion system with various combinations of the input parameters. (3) Conclusions based upon the analytical, computational and experimental work are given and some comparison is made with work reported in the current technical literature.

Rocketdyne, Canoga Park, Calif.
ACCELERATOR DESIGN TECHNIQUES FOR ION THRUST DEVICES, by S. L. Ellenberg. Rept. on Contract AF 49(638)344. 12 Feb 59, 45p. 7 refs. R-1430; AFOSR TN-59-194.
Order from LC mi$3.30, ph$7.80 PB 139 229

This report summarizes many of the problems associated with the ion accelerating section of the ion thrust device. Several methods for designing an ion accelerator are discussed and a specific design calculation is performed. A generalized description of a variety of ion accelerator geometries is presented.

Manufacturing Equipment and Processes

Aeon Labs., Egham, Surrey (Gt. Brit.)
A STUDY OF METAL CUTTING BY THE EXAMINATION IN THE ELECTRON MICROSCOPE OF SECTIONS CUT WITH A DIAMOND KNIFE, by R. Phillips. Annual technical rept. (Final) for 1 Dec 58-30 Nov 59 on Contract DA 91-591-EUC-989. 30 Nov 59, 43p. 5 refs. AD-231 399.
Order from LC mi$3.30, ph$7.80 PB 145 952

A transmission electron optical study of thin sections of cubic metals showed that the cutting process produced (1) broad bands of variable width in the direction of cutting (knife marks), (2) folds normal to the direction of cutting, and (3) a structure consisting basically of parallel lines of the order of 500 A spacing approximately normal to the direction of cutting.

Aeroprojects, Inc., West Chester, Pa.
FUNDAMENTALS OF ULTRASONIC WELDING. PHASE I, by J. Byron Jones, Nicholas Maropis and others. Final rept. for 1 Dec 57-1 Dec 58 on Contract NOas 58-108-c. May 59, 109p. 18 refs. Research rept. no. 59-105.
Order from OTS $2.50 PB 161 677

The investigations are oriented to the development of a phenomenological theory of ultrasonic or vibratory welding that will account for the observed effects. This Phase I of an extended research program is concerned with the development of techniques to permit quantitative investigation of the internal cyclic stresses, transient temperatures, and net energy associated with the generation of such metallurgical bonds. Preliminary information on the energy required to generate ultrasonic welds in several materials was obtained with a view to predicting ultrasonic weldability in terms of the more familiar material properties. (Author)

Air Materiel Command, Wright-Patterson AFB, Ohio.
PRYM PROCESS OF FABRICATING SEAMLESS HOLLOW BLADES FOR GAS TURBINES, by R. W. Biddle. 5 Nov 53, declassified [4 Sep 48]. 36p. F-TR-2146-ND; ATI-23 288.
Order from LC mi$3.00, ph$6.30 PB 146 164

A detailed description of the process, material, and equipment used in the fabrication of hollow turbine blades from sheet stock is given. The blade described was used in the Jumo 004 turbojet engine and consists of a rhomboid-shaped base. The material from which the blades were made is a nickel-chromium composition soft-annealed steel with some manganese, titanium, silicon with traces of sulphur and lead, with a strength of from 43 to 50 T/in.^{2} Blades are brazed to the wheel disk with a newly-developed silver brazing agent at an oven temperature of from 1150° to 1170°C. A listing of tools, gages, and fixtures required for the production of 200 blades per hour is given. The description of the operations performed by each piece of equipment is also included.

Cincinnati Milling Machine Co., Ohio.
HIGH TEMPERATURE MACHINING METHODS. PHASE I. EVALUATION OF ELEVATED TEMPERATURE MACHINING METHODS, by William Pentland, Clarence L. Mehl and Jens L. Wennberg. Rept. no. 1, 5 Sep 59-5 Feb 60, on Contract AF 33(600)40066. [1960] 187p. 52 refs.
Order from OTS $3.00 PB 161 680

A history of hot machining is presented and the results of an industry survey indicate the problem areas in cutting high strength materials for which elevated temperature techniques should be developed. Orthogonal cutting and tool-life turning tests, face milling and drilling tests were carried out on four representative aircraft materials, heat treated to the 350-600 BHN hardness range and the results of these are analyzed. The materials used were AISI 4340, Thermold J, 17-4 MO and 17-7 PH. A discussion of the potential of various heating methods is made and descriptions are included of practical evaluations using flame, furnace, induction, and radio-frequency resistance heating techniques. Studies of heat distribution and flow within workpieces are described and hazards of the process evaluated.

Defense Metals Information Center, Battelle Memorial Inst., Columbus, Ohio.
BIBLIOGRAPHY ON EXPLOSIVE METAL WORKING, by C. T. Olofson and F. W. Boulger. 7 Apr 60, 18p. 210 refs. DMIC memo. 51.
Order from OTS $0.50 PB 161 201

A considerable amount of effort has been and is being devoted to investigating the advantages and limitations of using explosive energy in metal-working operations. This bibliography was prepared in response to requests by groups considering experimental programs in this field.

Driver, Wilbur B., Co., Newark, N. J.
INDUSTRIAL PREPAREDNESS STUDY ON NON-NICKEL BEARING ALLOY BRAID WIRE, by William L. Stryker. Final rept. for 23 Aug 57-5 Sep 58 on Contract DA 36-039-sc-72780. [1958] 16p; AD 212 204.
Order from LC mi$2.40, ph$3.30 PB 145 703

Experimental forming of braid wire for cable from a nickel-free austenitic stainless steel containing 15.85% manganese, 14.02% chromium, 0.12% carbon, and 0.15% nitrogen.

General Electric Co., Utica, N. Y.
AUTOMATIC COMPONENT ASSEMBLY SYSTEM, by William R. Seigle. Final rept. on Contract DA 36-039-sc-70255. [1959] 130p. AD-216 617.
Order from LC mi$6.30, ph$19.80 PB 145 725

The automatic component assembly system (ACAS) demonstrated a way to use an incremental dimensioning system in electronic assembly hardware. The problem of programmed automation is no longer whether programmed electronic control is a valid concept, but whether to use tape or card programming. The principle of batch-sequential assembly operation introduced by the ACAS appears to be a major advance in production technology; it offers maximum machine utilization for either in-line or unitized machine systems. The actual implementation of a hardware program demonstrated the necessity for having incremental dimensioning standards on components as well as on the base, printed wiring or otherwise, upon which the components are to be mounted. A distinct advantage of mechanized assembly methods is the accurate and reliable electromechanical control of process parameters which is superior to manual control. The mechanized soldering technique employed by ACAS shows the quality and efficiency improvements made possible by mechanization. The appendixes contain a programming manual and the ACAS equipment design parameters.

Lockheed Aircraft Corp. [Burbank, Calif.]
HIGH ENERGY RATE METAL FORMING, by A. F. Watts and Glen N. Rardin. Interim technical rept. no. 8, for 1 Jan-31 Mar 60, on Contract AF 33(600)35543. [1960] 11p. LR 14408.
Order from LC mi$2.40, ph$3.30 PB 146 776

Tests were conducted previously on a two feet diameter water tank to establish procedures and materials most suitable for reducing the stresses in the walls of a tank during an explosive forming cycle. On the basis of these tests a full scale tank was designed and constructed. One feature of this tank is that the tank walls are not mechanically connected to the base. An aerator was included in the design based upon tests conducted previously.

North American Aviation, Inc., Downey, Calif.
PROPERTIES OF RESISTANCE SPOTWELD 24S-T3 AND 75S-T6 ALUMINUM ALLOY SHEET AND 17-7PH STAINLESS STEEL SHEET AT DEPRESSED AND ELEVATED TEMPERATURES, by E. J. Pelochino and J. R. Bellah. Rept. on Contract W33-038-ac-14191. 1 Feb 54, 143p. Rept. no. AL-1840; AD-29 182.
Order from LC mi$7.20, ph$22.80 PB 146 559

Design properties and test results at room, elevated and depressed temperatures of resistance spotwelded joints are presented. The major portion of the program was devoted to testing clad 24S-T3 and 75S-T6 aluminum alloy sheet and 17-7PH stainless steel in two conditions, THD (hardened and aged) and SA (stretched and aged). Bare 24S-T3, 75S-T6 and clad 61S-T6 aluminum alloy sheet was also tested. The results include spotweld shear, tensile, and combined shear and tensile strengths for various temperatures, exposure times and sheet thicknesses.

Stanford Research Inst., Menlo Park, Calif.
FEASIBILITY STUDY OF PLASMA WELDING OF REFRACTORY METALS. Progress rept. no. 2, 1 Sep-1 Nov 59, on Contract NOas-59-6234C. [1959] 2p. SRI Project SU-2927.
Order from LC mi$1.80, ph$1.80 PB 145 814

This study is concerned with the adaptation of the plasma jet to the welding of refractory metals such as Ta, Mo, Ti, Zr, and W. In order to adapt the plasma jet to welding, it is necessary to produce a jet of small diameter and to reduce the effects of high gas velocity in the jet.

Transport, Traction and Hoist Facilities

Army Transportation Research and Engineering Command, Fort Eustis, Va.
TUG HAWSER PULL STUDY, by Charles D. Roach. Sep 59, 18p. 1 ref. Research Technical memo. RTM 30; AD-230 923.
Order from LC mi$2.40, ph$3.30 PB 145 701

The calculations contained in this memorandum are designed to give a reasonably accurate estimate of the towrope pull of a normal single-screw tug at any speed within the usual towing speed range.

Computer Lab., Ordnance Tank-Automotive Command, Center Line, Mich.
DIGITAL COMPUTER PROGRAM FOR ACCELERATION PERFORMANCE, TRACKED VEHICLES, by Robert Arno. Rept. on Contract DA 20-089-ORD-39246. 25 Jan 60, 46p. Rept. no. RR-8.
Order from LC mi$3.30, ph$7.80 PB 146 761

A general computer program was written for the Electrodata 204 "Datatron" Digital Computer to calculate acceleration performance and related characteristics of tracked vehicles. Vehicle performance is determined at prescribed time intervals during acceleration from standstill to maximum velocity. Other additional data supplied by this program are vehicle speed, distance traveled, time of travel, sprocket torque, tractive effort, rolling resistance, drawbar pull, and acceleration. (Author)

Computer Lab., Ordnance Tank-Automotive Command, Center Line, Mich.
DIGITAL COMPUTER PROGRAM FOR WHEELED VEHICLE MOBILITY COMPUTATION, by Alexander Edwards. Rept. on Contract DA 20-089-ORD-39246. Jan 60, 78p. Rept. no. RR-7.
Order from LC mi$4.50, ph$12.30 PB 146 760

A general computer program was written for the Electrodata 204 Digital Computer to permit rapid solution of wheeled vehicle mobility performance. Curves of sinkage and drawbar pull versus mud and snow soil consistencies were plotted of various sized tires for preliminary design guidance. (Author)

MATERIALS

Bureau of Yards and Docks, Washington, D. C.
PRESERVATION, PACKAGING, AND PACKING OF "C" COGNIZANCE MATERIEL. Rev. 29 July 57, 73p. Technical pub. NAVDOCKS TP-PW-14; BUDOCKSINST 4030.1B.
Order from OTS $2.00 PB 161 539

This publication presents detailed instructions pertaining to the cleaning, preservation, packaging, marking, depreservation, and exercising of "C" Cognizance Materiel for (a) dead storage and (b) live storage. The processes specified herein are intended to render a functional service rather than to improve the appearance of materiel, and shall be so used.

Inland Testing Labs. [Morton Grove, Ill.]
UNIFORM DUPLICATION OF ENVIRONMENTAL TEST RESULTS. PART I. INFORMATION SURVEY, by Paul Gottfried, Chester G. Polak, and John McGee. Rept. on Contract AF 33(616)5413. Oct 58, 73p. 16 refs. WADC Technical rept. 58-613, Pt. I; AD-205 774.
Order from LC mi$4.50, ph$12.30 PB 146 574

The following is an account of work performed in the first of three phases on research to amplify and supplement certain detail in USAF specifications MIL-E-5272 and MIL-E-4970. This phase consisted of a literature survey, visits to industry and Government installations, and the development and distribution of a questionnaire. A tabulation of the responses to the questionnaire is also given and some of the recommendations are included. (Author)

Inland Testing Labs. [Morton Grove, Ill.]
UNIFORM DUPLICATION OF ENVIRONMENTAL TEST RESULTS. PART II. SURVEY ANALYSIS, by Paul Gottfried, Chester G. Polak, and John McGee. Rept. on Contract AF 33(616)5413. Nov 58, 52p. WADC Technical rept. 58-613, Pt. II; AD-205 775.
Order from LC mi$3.60, ph$9.30 PB 146 573

The report contained herein is an analysis and evaluation of the information obtained during the research and investigation conducted in Part I of this program. The factual or statistical presentation of this information was included in the Part I Technical Report. This report will be concerned only with the information which applies directly to nonrepeatability or nonuniformity of the environmental tests, specifically the tests of humidity, high temperature, low temperature, temperature shock, and sand and dust as specified in specifications MIL-E-5272 and MIL-E-4970. The analysis includes recommendations designed to clarify each of the specified test procedures and to improve the repeatability of the tests in such a manner that the test may be duplicated in diverse testing installations. Appendix I of this report contains the recommended revisions for specification MIL-E-5272 employing the results of the literature analysis. Appendix II of this report contains a recommended detail equipment specification to be used in conjunction with revised specification MIL-E-5272. The purpose of the detail specification is to establish a comparative test program which will evaluate the effectiveness of the proposed specification revisions and recommendations. AN INVESTIGATION OF THE MECHANICAL PROPERTIES OF CERMETS AS RELATED TO THE MICROSTRUCTURE, by Ira Binder. Rept. for 15 May 58-1 June 59 on Ceramic and Cermet Materials, Contract AF 33(616)5084. Jan 60, 102p. 7 refs. WADC Technical rept. 58-432, Pt. 2.
Order from OTS $2.50 PB 161 656

TiC/Ni compositions with 10, 20, and 40 percent nickel were tested for transverse rupture strengths up to 1600°C. Transverse bend, cantilever beam, hot deformation, and hot extrusion experiments were performed in order to study the onset of plastic deformation. These materials were plastically deformed, and their microstructures were studied to learn about the mode of deformation. Plastic flow of the nickel binder and alignment of the carbide grains were discovered. Other refractory hardmetal compositions, both single-phase and cemented, were tested in transverse rupture up to 1600°C and were also subjected to various forms of hot deformation. Transverse strength peaks, versus temperature, were found for each material in the range 800 - 1300°C. Reasons for this behavior are developed. Microstructures of these materials were examined in connection with the strength tests and deformation studies. (Author) (See also PB 151 722)

Armour Research Foundation, Chicago, Ill.
THE MECHANICAL PROTECTION OF THE W/Ir THERMOCOUPLE, by Gary Steven and Walter C. Troy. Rept. no. 18, 16 June 49, 6p. NEPA 1059-ARM-18; AD-204 056.
Order from LC mi$1.80, ph$1.80 PB 138 320

The W/Ir thermocouple was subjected to a series of tests designed to determine its behavior under different atmospheric conditions. An order was placed for zirconia bricks and tubes to be used as components in a gas fired high temperature furnace. The construction of the molybdenum wound high temperature furnace for the NEPA division was temporarily set aside pending a decision as to the heating space requirements. (See also PB 137 033)

Clevite Research Center, Cleveland, Ohio.
STUDY OF AGING OF HIGH PIEZOELECTRIC COUPLING CERAMICS, by F. Kulcsar and R. Gerson. Final rept. for 15 Aug 56-15 Aug 57 on Contract DA 36-039-sc-72832. 27 Aug 57, 64p. 6 ref 6 refs. AD-158 008.
Order from LC mi$3.90, ph$10.80 PB 146 530

A systematic study of aging in electromechanical parameters of poled ferroelectric ceramics was undertaken. The modified lead titanate zirconate composition showed an aging rate of 0.13% decade up to 200 days after poling. The stability of the material

with respect to thermal variation needs to be improved. The samples treated by γ-irradiation showed exceptional stability during room temperature storage (10 to 200 days after irradiation). The average change in resonant frequency (4 samples) was well under 0.5%. The heat treatment yields a small but significant improvement in aging characteristics. A poling temperature close to 30° to 70°C resulted in an earlier flattening of the aging curve. Several lead titanate zirconate ceramics with additions of 3- and 5-valent element oxides all had low mechanical Q values. Similar compositions with all of the ZrO_2 replaced by HfO_2 showed poor shelf aging with respect to resonant frequency. Additions of Cr_2O_3 or V_3O_8 to lead titinate zirconate compositions produced stable ceramics with mechanical Q's from 300 to 400 and good resonant frequency stabilities in the case of Cr_2O_3. Best results were obtained with a 0.70- to 0.75-wt % addition. A preliminary prestabilizing treatment (10 successive quenchings from oil at 250°C into oil at 25°C) is desirable after poling in order to minimize temperature hysteresis effects. The source of the ZrO_2 appeared to be an important performance factor.

Defense Metals Information Center, Battelle Memorial Inst., Columbus, Ohio.
THE DETERMINATION OF OXYGEN, NITROGEN, HYDROGEN, AND CARBON IN MOLYBDENUM, TUNGSTEN, COLUMBIUM, AND TANTALUM, by Manley W. Mallett. 31 Mar 60, 21p. 34 refs. DMIC memo. 49.
Order from OTS $0.50 PB 161 199

Oxygen: neutron activation, fluorination, other halogenation, fractography, mass spectrometry, solid mass spectrometry, isotopic dilution, emission spectrometry, vacuum fusion, inert-gas fusion, molybdenum, tungsten, columbium (niobium), tantalum; Hydrogen; Nitrogen: solution-distillation method, alkali fusion method, other methods; Carbon: gravimetric procedure, gasometric procedure, conductometric procedure.

PHYSICAL AND MECHANICAL PROPERTIES OF COLUMBIUM AND COLUMBIUM-BASE ALLOYS, by E. S. Bartlett and J. A. Houck. Rept. on Contract AF 18(600)1375. 22 Feb 60, 66p. 69 refs. DMIC rept. 125.
Order from OTS $1.75 PB 151 082

The current state of knowledge of the physical and mechanical properties of columbium and its alloy is reviewed. Columbium has good potential as an alloying base because of its low neutron-capture cross section (reactor applications) and high melting point, and related potential high-temperature strength (air- and space-vehicles structural applications). Pure columbium is soft and ductile and does not possess good strength at temperatures above 1600 F. Elevated-temperature strengthening is accomplished by solid-solution-strengthening (with tungsten or molybdenum) and dispersion-hardening (zirconium plus carbon) mechanisms. The effects of singular and combined alloying additions on fabricability and low- and high-temperature strength are discussed. The properties of current commercial and advanced laboratory alloys are correlated with strengthening mechanisms. A Cb-15W-5Mo-1Zr-0.05C-0.05 O alloy, with 100 hour, 2200 F rupture stress of 17,000 psi, is the most promising alloy to be developed to date. (Author)

INVESTIGATION OF FLAKE LAMINATE, by E. K. Lane, Jr. Final rept. for 23 Aug 54-30 Jan 58 on Contracts DAI-28-017-501-ORD(P)-1490 and DAI-19-059-501-ORD(P)-2302. [1958] 65p. AD-202 831.
Order from OTS $1.75 PB 161 679

Development of a method of producing a glass flake laminate. Methods investigated included trying to make glass flake by: Rolling Glass Beads, Rolling Glass Tape, Blowing Extruded Ribbon, Drawing Tape from a Lip, Drawing Tape from a Slot, Stretching Film by Diverging Wires, Stretching Glass Film by Rims Having Parallel Axes, and Stretching Glass Film by Rims Having Inclined Axes. Of all these methods, the apparatus which stretched glass film on rims having inclined axes proved to the most successful. Experimental work points to production of a continuous ribbon of glass film as a possibility.

National Bureau of Standards, Washington, D. C.
BASIC STUDY OF PARTICLE-IMPACT PROCESSES FOR APPLYING CERAMIC AND CERMET COATINGS. PHASE I. VELOCITY MEASUREMENTS OF FLAME-SPRAYED ALUMINUM OXIDE PARTICLES, by Dwight G. Moore, Warren D. Hayes, Jr. and Alfred W. Crigler. Rept. on Surface and Interface Phenomena of Matter, Contract AF 33(616)58-19. Oct 59, 22p. 8 refs. WADC Technical rept. 59-658, Pt. 1.
Order from OTS $0.75 PB 161 685

The velocities of flame-sprayed particles of aluminum oxide from both a rod-type and powder-type oxyacetylene gun were determined with (1) a high-speed cinecamera, (2) a streak camera, and (3) a rotating disc velocimeter. An analysis of the measurements indicated that each of the three methods had potential weaknesses. In the two photographic methods, the film was exposed by the radiant energy emitted by the particles themselves; the results of these measurements were such as to suggest that the smaller (and presumably faster) particles were not being recorded on the film. The rotating-disc velocimeter method was based on measuring the displacement of the pattern of sprayed particles on a rotating disc caused by a "shadow bar" attached to the disc at a fixed distance toward the spray gun. This method gave an average velocity for only the adhering particles. The average velocities obtained with the rotating-disc velocimeter varied with distance from the gun nozzle. The peak velocity for the rod gun was 566 ft./sec.; for the powder gun, 145 ft./sec. (Author)

Nepa Div., Fairchild Engine and Airplane Corp., Oak Ridge, Tenn.
MAGNESIA, by M. A. Schwartz. Feb 48, 121p. 103 refs. NEPA 463 IHR-E14.
Order from LC mi$6.30, ph$19.80 PB 146 223

Magnesia and its compounds such as spinel, forsterite, etc. have gained prominence in recent years as important super-refractory materials. The increased number of companies producing magnesia has resulted in making it more available in greater purity and at lower cost. An important development in this respect has been its extraction from sea-water. Improved methods of electric sintering and fusing of the material has also assisted in producing an improved product; and this material, by itself and in combination with other materials will undoubtedly offer increasing inducements for high temperature research. In reporting on the property data of magnesia, conflicting results are very evident, which is due mainly to the various grades of magnesia tested. Wherever possible, descriptions of the samples used in conducting tests will be included.

Nepa Div., Fairchild Engine and Airplane Corp., Oak Ridge, Tenn.
THORIA, by M. A. Schwartz. Dec 48, 43p. 30 refs. NEPA 875 EMR-42 (Supersedes sections on Thoria in NEPA 309-IHR-14).
Order from LC mi$3.30, ph$7.80 PB 146 222

Fuels, Lubricants, and Hydraulic Fluids

Hefco Labs., Inc. Detroit, Mich.
THE CHEMICAL STABILIZATION OF NITROMETHANE AND TETRANITROMETHANE FOR USE IN MONOFUEL COMBINATIONS. Technical rept. for Dec 48-May 49 on Rocket Fuels, Contract N7onr-473, T.O. 1. May 49, declassified 16 Aug 55. 77p. 5 refs. ATI-58097.
Order from LC mi$4.50, ph$12.30 PB 146 519

Progress made in the investigation of the chemical stabilization of nitromethane and intranitromethane for use in monofuel combinations is reported. Relatively less work has been done on new fuel than on refinements of the testing techniques and the development of new testing methods. The techniques and methods discussed are mechanical and explosive impact testing, sand bomb testing, thermal stability testing, and thermal testing. A new thermal testing apparatus has been designed with which it is hoped that direct measurements of the temperature and pressure of fuels during the course of reaction can be obtained. The apparatus consists essentially of a test cavity closed by a thin membrane and a hardened steel cap.

Hefco Labs., Inc., Detroit, Mich.
THE CHEMICAL STABILIZATION OF NITRO METHANE AND TETRANITROMETHANE FOR USE IN MONOFUEL COMBINATIONS. Technical rept. for June 49-Feb 50 on Rocket Fuels, Contract N7onr-473, T.O. 1. [1950] declassified 16 Aug 55, 70p. 4 refs. ATI-77 605.
Order from LC mi$3.90, ph$10.80 PB 146 288

Progress made in the study of the chemical stabilization of nitromethane and tetraitromethane for use in rocket propellants is reported. A large part of the time was spent in an examination of the purity of the two components of the system, a study of methods of measuring and improving the purity, and of the determination of the purified materials. A study was made of the phase diagram of the nitromethane-tetranitromethane system. Previous work on the analysis of the combustion gases has been re-examined and improvements have been made in the analytical procedure. Work was also accomplished on inhibitors for the detonation of mixtures of nitromethane and tetranitromethane by explosive impact and on the explosive impact sensitivity of mixtures. Preliminary tests have been made with the new thermal stability apparatus. (Author)

Naval Boiler and Turbine Lab., Philadelphia, Pa.
EVALUATION OF H_2O WASHING TECHNIQUES FOR NAVY SPECIAL FUEL OILS, by H. M. Foltes. Evaluation rept. 2 Mar 59, 14p. NBTL Test P-336; AD-214 345.
Order from LC mi$2.40, ph$3.30 PB 145 823

Water washing of fuel oils reduces the sodium content to a great extent but has only a small effect on the removal of organic vanadium compounds present in fuel oils. Mono and dibasic ammonium phosphates, employed as water washing agents, resulted in lower ash contents than do magnesium or calcium salts.

Naval Ordnance Test Station, China Lake, Calif.
OPTIMUM PROPORTIONING OF TWO PROPELLANTS TO OBTAIN MAXIMUM BURNT VELOCITY, by R. H. Olds. 7 Apr 58. 65p. 5 refs. NOTS 2002; NAVORD rept. 5873; AD-163 092.
Order from LC mi$3.90, ph$10.80 PB 145 910

Using burnt velocity as a measure of performance, it is shown that better performance may be obtained from combinations of two propellants than can be obtained from either propellant alone. The improved performance depends upon the relative densities of the two propellants as well as upon their energies. Optimum performance results from a suitably programmed variation of propellant proportions throughout burning. The present work confirms an earlier effort by Lorell and Hibbs of the Jet Propulsion Laboratory and extends the analysis to some cases not previously considered. (Author)

Phillips Petroleum Co., Bartlesville, Okla.
GAS TURBINE AND JET ENGINE FUELS, by George D. Kittredge. Summary rept. for 1 July 57-30 June 58 on Contract NOas-58-310-d. 22 Sep 58, 79p. 10 refs. Research Div. rept. 2182-58R;

AD-205 981.
Order from LC mi$4.50, ph$12.30 PB 146 632

Completion of the 96 week storage stability program discussed in earlier contract reports has confirmed preliminary findings that no serious deterioration has taken place with the JP-5 specification test fuels during this term of ambient temperature storage, in terms of either existent gum content or CFR Fuel Coker ratings. Hot room storage at 110 F (indicated to be roughly four times as severe as ambient storage) did cause JP-5 fuels from West Coast and Gulf Coast sources to go "off spec" in terms of gum content after 48 weeks time. Two-inch combustor testwork at moderate-to-high pressure levels has established a relationship between radiant heat flux across the flame zone and metal temperatures. Flame tube metal burn-off rates also agreed reasonably well with transverse radiation intensity and flame tube temperature. Fuel type was shown to influence radiant heating of the combustor liner in the following order of decreasing severity -- aromatics, naphthenes and paraffins, followed by an alcohol.

Rock Island Arsenal Lab., Ill.
INVESTIGATION OF RESIN SYSTEMS AS BONDING AGENTS FOR DRY LUBRICANTS, by F. S. Meade and G. P. Murphy. 4 June 59, 32p. 8 refs. Rept. no. 59-1515; AD-217 315.
Order from LC mi$3.00, ph$6.30 PB 146 485

Eighteen resin systems were pigmented with micro-size molybdenum disulfied in four pigment-to-resin ratios: 0:1, 1:1, 3:1, and 9:1, to obtain dry lubricant formulations. The lubricating properties of the cured dry lubricant formulations were evaluated by means of a Shell Four-Ball Wear Tester, Shell Four-Ball Extreme Pressure Tester, Falex Lubricant Test, and Cincinnati Stick-Slip Tester. The dry lubricant formulations were also examined for storage stability after at least 12 months storage at room temperature. The molybdenum disulfide resin bonded dry lubricants were statistically ranked as to their over-all lubricating effectiveness. Dry lubricant formulations incorporating the same type of resins supplied by different sources were not necessarily ranked the same. The most effective pigment-to-resin ration was 9:1 and the most effective resin systems at this pigment-to-resin ratio, taking into consideration both lubricative properties and storage stability, were epoxy-phenolic and epoxy-polyamide resin systems. (Author)

Fabric Research Labs., Inc., Dedham, Mass.
SOME ASPECTS OF BENDING RIGIDITY OF SINGLES YARNS, by Milton M. Platt, William G. Klein, and Walter J. Hamburger. Technical rept. no. 7 on Contract Nonr-1422(00). 15 Mar 59, 59p. 11 refs.
Order from LC mi$3.60, ph$9.30 PB 145 927

Theoretical analyses are given of the effects of fiber properties and yarn structure on singles yarn bending rigidity. The two extreme cases of (a) complete freedom and (b) no freedom of relative fiber motion are analyzed. The effects on yarn rigidity of fiber dimensions, fiber stiffness, torsional to bending rigidity ratio, yarn density, size, and twist, fiber clustering, and prior relaxation treatments are analytically investigated. (See also PB 143 610)

Materials Lab., Wright Air Development [Div.] Wright-Patterson AFB, Ohio.
EVALUATION OF NYLON "6" CORDS, RIBBON AND TAPES, by C. F. Holmes, Jr. Rept. for June 54-June 58 on Air Force Textile Materials. Jan 59, 14p. WADC Technical note 59-14.
Order from LC mi$2.40, ph$3.30 PB 146 278

The purpose of this evaluation was to determine if materials made from nylon "6" are suitable substitutes for materials made from nylon "66". This was accomplished by manufacturing certain tapes, ribbons, cords and threads in accordance with the construction requirements of appropriate specifications except that nylon "6" was used in the place of nylon "66". The materials were then tested to determine if they met the physical requirements of the specifications. It was found that some of the materials did not meet some of the breaking strength and elongation requirements of the appropriate specification. Materials made from nylon "6" can not, therefore, be used indiscriminately in the place of nylon "66" materials. (Author)

Quartermaster Research and Engineering Center, Natick, Mass.
DEVELOPMENT OF SHADE STANDARD AND TOLERANCES FOR USAF BLUE 85 SERVICE OVERCOAT, by Frank J. Rizzo, Constantine J. Megas, and others. Rept. for 23 Sep 53-19 Dec 58 on Air Force Textile Materials, Contract AF 33(616)53-221. Jan 60, 67p. 11 refs. WADC Technical rept. 59-397.
Order from OTS $1.75 PB 161 684

The work involved development of a formulation of high order colorfastness properties, for Air Force Service Overcoat, practical for the Industry to apply routinely, and application of such formulation to the preparation of a new shade standard and a practical range of color tolerances. The resultant studies here reported have fulfilled the stated requirements. The formulation is colorfast; the tolerance range is of a degree of spacing permissible in end use without apparent inconvenience to the Industry in attainment. Colorfastness of the tolerance range relative to standard is such that uniformity in appearance throughout the useful life of the garment seems reasonably assured.

Plastics

Army Prosthetics Research Lab., Washington, D.C.
DILAMINAR COSMETIC GLOVES, by Allen Winer. 6 Mar 59, 8p. 1 ref. Technical rept. no. 5915; AD-212 658.
Order from LC mi$1.80, ph$1.80 PB 146 214

A latex dipping method has been developed to produce abrasion resistant cosmetic gloves by using a dilaminar approach. This new method apparently eliminates the serious problem of poor resistance to abrasion and tack development which has thus far retarded the use of this laboratory's standard terpolymer latex for cosmetic gloves.

Army Prosthetics Research Lab., Washington, D. C.
REVISED SUNLAMP EXPOSURE TEST FOR VINYL FILMS, by James T. Hill. Sep 58, 6p. Technical rept. no. 5824; AD-203 928.
Order from LC mi$1.80, ph$1.80 PB 146 854

A method used to accelerate the aging of vinyl materials consists of exposing the test specimens for 3 weeks to a sunlamp and measuring the color changes that occur in these specimens. In order to duplicate sunlamp exposure tests it is necessary to expose the samples to the same amount of radiant energy. In order to increase the precision of duplication it is necessary to continuously measure the energy from these lamps and thus expose the samples to equal amounts of radiation. For this reason an investigation was conducted to develop a method of measuring U. V. energy.

Midwest Research Inst., Kansas City, Mo.
FABRICATION AND DEVELOPMENT OF COMPOSITE PLASTIC PLATES. Final rept., Phase 2, 16 July 58-14 Apr 59, on Contract NOas 58-563-c. 6 Jan 60, 45p. 17 refs. AD-232 235.
Order from LC mi$3.30, ph$7.80 PB 145 904

Transparent thermosetting plastics were used in making composite aircraft glazing materials. These plastics were cast in situ on "hot stretched" acrylic sheet. It will provide an insulating layer to protect the acrylic from the high skin temperatures encountered on supersonic aircraft. This program consists of two parts. Phase I, completed in August, 1958, was the fabrication of a composite material from hot stretched acrylic and an allyl resin. Phase II is discussed in this report. The diglycidyl ether of bisphenol A, an epoxy resin, was crosslinked with hexahydrophthalic anhydride using benzyltrimethylammonium chloride as a catalyst and triphenyl phosphite as an antioxidant. This system was cast onto a curved section of hot stretched acrylic. The resultant composite was nearly water-white and very transparent. (See also PB 144 890)

Naval Ordnance Lab., White Oak, Md.
DIFFERENTIAL THERMAL ANALYSIS OF POLYMERIC MATERIALS, by Hugh C. Anderson. 18 Feb 59, 29p. 11 refs. NAVORD rept. 6210; AD-218 198.
Order from OTS $0.75 PB 161 676

The assembly and operation of a differential thermal analyzer is described. Its versatility, order of precision and accuracy is demonstrated. The analyzer is shown to be an important tool in studying the thermal processes which take place when a polymeric material is pyrolyzed. (Author)

Naval Ordnance Lab., White Oak, Md.
A NEW METHOD FOR DETERMINING THE SECOND ORDER TRANSITION IN POLYMERS, by R. W. Warfield. 10 Mar 59, 17p. 18 refs. NAVORD rept. 6285.
Order from LC mi$2.40, ph$3.30 PB 145 819

A new method is described for determining the second order transition in polymers. The method is based upon an analysis of the temperature dependence of electrical resistivity. When resistivity is plotted vs. temperature, a change in slope occurs at the transition point. Results obtained by this method have been shown to agree closely with independent specific heat determinations and with published values. The nature of the second order transition in polymers is discussed. (Author)

Naval Ordnance Lab., White Oak, Md.
THE SPECIFIC HEAT OF THERMOSETTING POLYMERS, by R. W. Warfield, M. C. Petree and P. Donovan. 14 Jan 59, 21p. 19 refs. NAVORD rept. 6255; AD-216 802.
Order from LC mi$2.70, ph$4.80 PB 145 822

Specific heat, as a function of temperature has been determined over the range of 30°C to 160°C for a number of thermosetting polymers. The data were obtained by means of an adiabatic calorimeter. In agreement with theory, the specific heats of the polymers showed a progressive increase with increasing temperature. In many cases large increases in specific heat have been observed which are indicative of second order transitions within the polymer. (Author)

Naval Ordnance Lab., White Oak, Md.
A STUDY OF THE POLYMERIZATION OF THERMOSETTING POLYMERS BY ELECTRICAL RESISTIVITY TECHNIQUES, by R. W. Warfield and M. C. Petree. 5 Aug 59, 22p. 20 refs. NAVORD rept. 6702.
Order from LC mi$2.70, ph$4.80 PB 145 821

Electrical volume resistivity measurements made isothermally during polymerization have been used to study the bulk polymerization of epoxide, polyester and polyurethane polymers. Whenever possible, kinetic parameters have been calculated. The existenc of micelles in the solid polymer is postulated as exp aining the observed differences in the E_C values for these crosslinked polymers. The results of this study indicate that electrical resistivity measurements are sensitive to the rate and extent of polymerization and appear to be useful in studying the structure of the solid polymer.

Rubber and Elastomers

Institute of Rubber Research, U. of Akron, Ohio.
STRESS RELAXATION AND STRUCTURE OF HIGH TEMPERATURE ELASTOMERS, by Maurice Morton, V. R. Allen, and R. D. Gates. Technical rept. no. 4 for 1 Mar-31 May 59 on Contract Nonr-2573(00). [1959] 26p. 12 refs.
Order from LC mi$2.70, ph$4.80 PB 146 230

Natural rubber vulcanizates, having different types ot crosslinks, have been found to have very similar sol versus degradation relations. Based on this and other factors, it is proposed that the degradation reaction for these vulcanizates is primarily a random chain scission process. Also, in order to explain the difference between the theoretical relation and the experimental results, it is proposed that this scission of chemical bonds is accompanied by the simultaneous release of chain entanglements ("physical" crosslinks). This, therefore, results in a concurrent crosslink destruction and random chain scission.
(See also PB 144 960)

Rock Island Arsenal Lab., Ill.
HIGH TEMPERATURE PROPERTIES OF ELASTOMER VULCANIZATES, by E. W. Bergstrom.
21 Jan 60, 47p. 2 refs. Technical rept. no. 60-188.
Order from OTS $1.25 PB 161 689

The high temperature capabilities and limitations of vulcanizates prepared from many of the currently available elastomers were determined. The physical properties of vulcanizates were measured both after aging and at various high temperatures. The vulcanizates were then rated as to heat resistance on the basis of retention of tensile strength. Results of a great many tests and formulations are presented.

Rock Island Arsenal Lab., Ill.
ORGANO METALLIC SOAPS AND POLYHYDRIC COMPOUNDS AS HEAT STABLE INHIBITORS FOR SBR VULCANIZATES, by Frank B. Testroet.
29 Dec 59, 17p. 4 refs. Rept. no. 59-3249; AD-233 082L.
Order from OTS $0.50 PB 161 678

Organo metallic soaps and polyhydric compounds, separately and in combination with each other, were evaluated to determine the capacity of these materials for protecting SBR vulcanizates from the deleterious effect of heat aging. Although these materials have little value as heat stable inhibitors when used separately, it appears that when combined, a synergistic effect is obtained which leads to protection of the vulcanizates during heat aging.

MATHEMATICS

ON TIME SERIES ANALYSIS AND REPRODUCING KERNEL SPACES, by N. Donald Ylvisaker. Technical rept. no. 1 on Contract DA 04-200-ORD-996.
4 Nov 59, 43p. 10 refs; AD-229-913.
Order from LC mi$3.30, ph$7.80 PB 145 715

The representation of a second order process by a reproducing kernel space is here taken on the real line. Section 2 is devoted to some aspects of the general theory of reproducing kernel spaces and to the particular case in which K is a kernel on E_2 of the form $K(s, t) = k(s-t)$.

California U., Berkeley.
DISTRIBUTIONS AND GENERAL THEORY OF DIFFERENTIAL OPERATORS, by François Trèves. Technical rept. no. 1 on Contract AF 49(638)604.
Jan 60, 134p. 4 refs. AFOSR-TN-60-34.
Order from LC mi$6.90, ph$21.30 PB 146 082

These notes correspond to a series of lectures given at the University of California in Berkeley during the term of Fall 1959. The purpose of those lectures was to introduce students to the techniques of topological linear spaces and Schwartz's distributions in the field of linear partial differential equations. Actually only a few topics are studied and the lectures are essentially concerned with the case of constant coefficients, more precisely with the general theory, that is to say with the properties independent from type. These notes do not contain any new result; they are essentially excerpts from works by L. Hörmander, B. Malgrange and L. Schwartz.

Cornell U., Ithaca, N. Y.
ON A SERIES OF COSECANTS II, by Harry Kesten. Rept. on Contract Nonr-401(03). [1959] 18p.

OPENNESS OF THE DERIVATIVE OF A COMPLEX FUNCTION, by Robert L. Plunkett. Rept. on Contract AF 49(638)598. Sep 59, 9p. 3 refs. AFOSR-TN-59-1120.
Order from LC mi$1.80, ph$1.80 PB 145 769

The principal object of this paper is to present a purely topological proof of the strong openness of the derivative of a complex function. This openness is, of course, a direct consequence of the existence of the second derivative, but the proof of that existence still requires the use of powerful techniques of function theory which depend on complex integration. The proof presented here is therefore necessarily independent of the existence of the second derivative.

Franklin Inst. Labs. for Research and Development, Philadelphia, Pa.
A DERIVATION OF THE BASIC EQUATIONS FOR HYDRODYNAMIC LUBRICATION WITH A FLUID HAVING CONSTANT PROPERTIES, by Harold G. Elrod. Interim rept. on Contract Nonr-2342(00).

Apr 59, 21p. 2 refs. Rept. no. I-A2049-5.
Order from LC mi$2.70, ph$4.80 PB 145 943

In this report small parameter techniques are used to derive Reynolds' lubrication equations, and refinements thereof, from the full Navier-Stokes equation, for fluids having constant properties. An effort has been made to retain vigor in the development comparable to that used in present-day boundary-layer developments. Analytical techniques similar to those employed here have been adapted to the derivation of equations applicable to fluids having pressure and temperature-dependent properties, such as gases. The results will be presented in a subsequent report.

Institute for Advanced Study, Princeton, N. J.
INTRINSIC OPERATORS IN THREE-SPACE, by Victor L. Shapiro. Rept. on Contract AF 49(638)253.
May 59, 17p. 9 refs. AFOSR-TN-59-499; AD-215 924.
Order from LC mi$2.40, ph$3.30 PB 146 213

The following theorem is proved: Let D be a domain in Euclidean 3-space and let v be a continuous vector field defined in D. Then a necessary and sufficient condition that v be locally in D the gradient of a potential of a distribution with continuous density, is that the intrinsic curl of v be zero in D and the intrinsic divergence of v be continuous in D.

ON THE DIRICHLET PROBLEM FOR THE REDUCED WAVE EQUATION, by Rolf Leis. Rept. on Contract AF 49(638)229. June 59, 25p. 12 refs.
Research rept. no. BR-30; AFOSR-TN-59-945.
Order from LC mi$2.70, ph$4.80 PB 145 743

In this paper, an existence theorem for the exterior Dirichlet problem for the reduced wave equation will be given for piecewise smooth surfaces. (Author)

Johns Hopkins U., Baltimore, Md.
ON LOCAL AND GLOBAL PROPERTIES OF CONVEX SETS AND HYPERSURFACES, by Richard Sacksteder. Doctoral thesis. Technical note no. 14 on Contract AF 18(603)41. Nov 59, 47p.
28 refs. AFOSR-TN-59-1294.
Order from LC mi$3.30, ph$7.80 PB 145 774

In the first chapters, there is obtained a generalization of a theorem of Tietze characterizing convex sets by local properties. This result is used in the second chapter to prove the main result: Let S be a (sufficiently smooth) isometric immersion of a complete n-dimensional Riemannian manifold M^n in a Euclidean space E^{n+1} with the intrinsic property that the second fundamental form of S is semi-definite at every point and definite at some point. Then S is the boundary of a convex body (although if M^n is not complete, S need not even be locally convex). The third chapter deals with a number of topics. Examples are given to show that theorems of Hilbert and Weyl, concerning extrema of principle curvatures or of mean and Gauss curvatures at non-umbilic points, are false without suitable smoothness assumptions. (Author)

AN APPLICATION OF THE POTENTIAL ANALOGY TO SOLVING HURWITZ POLYNOMIAL EQUATIONS, by Henry G. Ansell. Rept. on Contract AF 30(602)1709. 24 Sep 58, 34p. 11 refs. Research rept. R-686-58; PIB-614; RADC-TN-58-391; AD-148 889.
Order from LC mi$3.00, ph$6.30 PB 146 179

A method of locating the zeros of Hurwitz polynomials with the aid of a conducting sheet is presented. The technique is a compromise between purely computational solution, and solution by digital computer, in that the purely computational work is greatly simplified, and the analogue technique used is simple to set

up and operate. Computationally, the proposed method requires solving polynomial equations of reduced order having only real, positive roots. For example, determining by this method the zeros of a quartic Hurwitz polynomial merely requires factoring quadratics for real roots. The equipment used consists essentially of a uniform-resistivity sheet, a power source supplying electrodes with direct current, and a d. c. null voltage detector (e. g., a vacuum tube voltmeter). The method requires detecting null voltages on the surface of the conducting sheet. The basis of the method is explained, and illustrative examples given. (Author)

FUNCTIONS OF RESTRICTED VARIATION, by Preston C. Hammer and John C. Holladay. Rept. on Contract DA 11-022-ORD-2059. Nov 58, 23p. 15 refs. MRC Technical Summary rept. no. 58; AD-207 994.
Order from LC mi$2.70, ph$4.80 PB 146 257

For real-valued functions defined on a simply ordered set, we introduce the concept of the k-variations which result from limiting the number of points in a partition to k . These k-variations exist finitely for bounded functions. If for a given function the sequence of differences between (k + 1)-variations and k-variations has the limit zero as k increases we say the function is of restricted variation, In this paper various properties of functions of restricted variation are derived. It is shown that there exists an extension of the simply ordered set S to a simply ordered compact set S* such that every function f of restricted variation on S may be extended to a function f* continuous on S* and conversely.

OPTIMAL APPROXIMATIONS AND ERROR BOUNDS, by Michael Golomb and H. F. Weinberger. Rept. on Contract DA 11-022-ORD-2059. Oct 58, 75p. 29 refs. MRC Technical Summary rept. no. 49; AD-208 052.
Order from LC mi$4.50, ph$12.30 PB 146 256

Most known error estimates for approximation processes assign one, or at most a few different expressions for the error, to any particular process. It is a matter of luck whether or not the computer has available the information about the unknown function required by the particular expression and whether or not the error bound based on this expression uses all the information he does have. One may make the general statement that the more refined an approximation process is, the higher are the derivatives of the unknown function occurring in the error term, and hence the more likely it is that their magnitude is unknown. The purpose of the present paper is to free the numerical analyst from "the slings and arrows of outrageous fortune" by supplying him with the means of estimating errors in terms of what he knows. The general problem studied is: how to derive from a given amount of information about the unknown function u the total range of possible values of the functional F(u).

POLYNOMINALS DEFINED BY A DIFFERENCE SYSTEM, by Glen Baxter. Technical rept. no. 11 on Contract AF 18(603)30. 15 Oct 59, 77p. 6 refs. AFOSR-TN-60-93.
Order from LC mi$4.50, ph$12.30 PB 145 761

A study is made of the polynomials $u_n(t)$ and $v_n(t)$ which are defined by the difference system

$$\begin{cases} \Delta u_n = \alpha_n e^{int} v_n \\ \Delta v_n = \beta_n e^{-int} u_n , \end{cases}$$

where α_n and β_n are presumed known. A relation between u_n and v_n and orthogonal polynomials as defined by Szegö is also considered. Application is made of the results to the problem of determining the distribution of max $(S_0, \ldots, S_n)$ and min $(S_0, \ldots, S_n)$ for the partial sums S_n of a sequence of independent, identically distributed random variables. ALGEBRAS OF HOLOMORPHIC FUNCTIONS ON ONE-DIMENSIONAL VARIETIES, by Hugo Rossi. Rept. on Contract AF 49(638)692. Oct 59, 38p. 12 refs. AFOSR-TN-59-1179.
Order from LC mi$3.00, ph$6.30 PB 145 771

This note studies one-dimensional analytic spaces with emphasis on the maximality problem of the algebra of holomorphic functions on a compact subset, first considered for Riemann surfaces by John Wermer. It is proven that this is the only case where such an algebra is maximal. Representations of subalgebras of holomorphic functions on Riemann surfaces as algebras on an analytic is also considered. THEORY AND APPLICATION OF THE SEPARABLE CLASS OF RANDOM PROCESSES, by Albert H. Nuttall. Doctoral thesis. Rept. on Contract DA 36-039-sc-64637. 26 May 58, 62p. 16 refs. Technical rept. 343; AD-214 552.
Order from LC mi$3.90, ph$10.80 PB 145 781

The separable class of random processes is defined as that class of random processes for which the g-function,

$$g(x_2, \tau) = \int_{-\infty}^{\infty} (x_1 - \mu)\, p(x_1, x_2; \tau)\, dx_1$$

separates into the product of two functions, one a function only of x_2, the other a function only of τ. The second-order probability density function of the process is $p(x_1, x_2; \tau)$ and μ is its mean. Various methods of determining whether a random process is separable are developed, and basic properties of the separable class are derived.

THE BANG-BANG PRINCIPLE, by J. P. LaSalle. Rept. on Contract AF 49(638)382. Nov 59, 23p. 10 refs. Technical rept. 59-5; AFOSR-TN-59-1142.
Order from LC mi$2.70, ph$4.80 PB 145 770

It has for sometime been an intuitive principle that if a system is to be guided to an objective in minimum time and the steering is limited, then optimal steering can only be achieved by at all times using the maximum steering available. This has been called the "bang-bang" principle. The validity of this principle and the extent of control that can be achieved are the main topics discussed in this paper. The system being controlled is assumed to be linear and considered as a function of the time the steering enters linearly. The coefficients need not be constants although some aspects of the constant coefficient case are simpler. (Author)

In this report, the following theorem is proved: Let K(x) be a planar Calderon-Zygmund kernel in class Lip $(\alpha, 2)$, $1/2 < \alpha < 1$, and let k(y) be its principal-valued Fourier transform. Let F be a countably additive set function defined on the Borel sets of the plane of finite total variation and let f be the Fourier-Stieltjes transform of F. Then $\int_{E_2} e^{-|y|/R} e^{i(y, x)} f(y)\, k(y)\, dy$ tends to a finite limit almost everywhere as $R \to \infty$. (Author)

A NOTE ON THE LIMITING RELATIVE EFFICIENCY OF THE WALD SEQUENTIAL PROBABILITY RATIO TEST, by Robert Bechhofer. Technical rept. no. 15 on Contract AF 49(638)230. 8 Jan 60, 7p. 9 refs. AFOSR-TN-60-35.
Order from LC mi$1.80, ph$1.80 PB 145 776

The efficiency (measured in terms of ratio of average sample size to single-sample size) of the Wald sequential probability ratio test relative to the best competing single-sample procedure for testing $H_0 : \theta = \theta_{0_2}$ vs $H_1 : \theta = \theta_1$ $(\theta_0 < \theta_1)$ when X is distributed $N(X \mid \theta, \sigma^2)$ with known σ^2 is studied for fixed $(\theta, \theta_0, \theta_1)$ as the specified probabilities of error, $\alpha = P$ [Reject $H_0 \mid \theta = \theta_0$] and $\beta = P$ [Accepted $H_0 \mid \theta = \theta_1$], approach zero. The limit is shown to depend on the relative rates at which α and β approach zero. In particular, when $a\ \alpha = \beta$ $(a > 0)$ this limiting relative efficiency is equal to $(\theta_1 - \theta_0)/(4 \mid \theta_1 + \theta_0 - 2\theta \mid)$. The practical implications of this result are discussed. (Author)

ELEMENTS OF THE THEORY OF EXTREME VALUES, by Benjamin Epstein. Technical rept. no. 2 on Contract Nonr-2575(00). 15 Apr 59, 31p. 8 refs.
Order from LC mi$3.00, ph$6.30 PB 145 946

The statistical theory of extreme values has, in recent years, been very useful in connection with a variety of applied problems. However, the engineer faced with the task of learning the elements of this theory and then applying it, finds that the literature is both extensive and difficult. He has to digest many new definitions, terms, and concepts before he can apply the theory. This is neither desirable nor necessary. While the theory of extreme values, viewed in its entirety, is a beautiful and in places esoteric theory, its basic elements can be given in a fairly compact form. Such a presentation is given in this paper.

ON THE HOMOTOPY PROPERTIES OF THE COMPONENTS OF THE MAPPING SPACE X^{S^p}, by Sebastian S. Koh. Technical note no. 7 on Contract AF 49(638)179. Mar 60, 14p. 11 refs. AFOSR-TN-60-272.
Order from LC mi$2.40, ph$3.30 PB 146 766

The objective of this note is to study whether the various components of the mapping space of all continuous maps from a given sphere S^p into another sphere S^q are of the same homotopy type. Because of the recent results of the homotopy groups of spheres, more general information has been deduced about the homotopy types of these components than the existing results found by G. W. Whitehead and S. T. Hu fourteen years ago. (Author)

UNBIASED, CONTINUOUS PARAMETER ESTIMATORS OF THE MEAN OF RANDOM PROCESSES (AVERAGING FUNCTIONS) by P. J. Beutler. Rept. on Proj. Michigan, Contract DA 36-039-sc-78801. May 59, 17p. 7 refs. Rept. no. 2900-13-T; AD-215 965.
Order from LC mi$2.40, ph$3.30 PB 145 998

A class of realizable weighting functions constitute unbiased estimators of the (invariant) mean of a random process. All such weighting functions are limit equivalent with respect to a stretched or compressed time scale, if a mean square error criterion is employed. These limit properties hold for nonstationary as well as stationary processes. An approximation theorem is stated and proved, the extension of the proof to nonstationary processes again being indicated. The following optimization problem is treated. A nonstationary process has time varying mean a(t), where a(t) is restricted to some specified class. From the set of realizable filters unbiased with respect to a(t), and having memory T, find that filter which gives the best estimate of $a(t_o)$ at time $t_o + t_p$, t_p being an interval over which prediction is required. "Best" is again interpreted in a mean square sense. The solution to the optimization problem is expressed in the form of an integral equation.

A CLASS OF MULTIPLE-ERROR-CORRECTING BINARY CODES FOR NON-INDEPENDENT ERRORS, by P. Fire. Technical rept. no. 55 on Contract Nonr-225(24). 24 Apr 59, 50p. 10 refs.
Order from OTS $3.30, ph$7.80 PB 145 801

In many data transmission and processing systems, the occurrence of multiple errors within a word is known to be a nonindependent phenomenon, i.e., the probability of an error occurring in a particular binary digit (binit) of the word is conditional on whether any errors occurred in some number of preceding binits. A class of parity-check error-correcting codes, specifically designed to cope with this situation, is described in this paper. These codes have the peculiar property that the check word derived in the normal decoding process is composed of two subwords, one defining the errors' pattern and the other indicating the error pattern's location within the word. The corrupted word is corrected merely by adding the shifted error-pattern subword to the indicated incorrect portion of the received word.

A PREDICTOR ELIMINATION PROGRAM WITH PREDICTOR RETAINMENT FOR THE IBM TYPE 650, by Dennis E. Hamilton. Rept. on Contract Nonr-477(08) and Public Health Research Grant M-743(C4). Apr 59, 9p. 5 refs; AD-229 938
Order from LC mi$1.80, ph$1.80 PB 145 797

This program is a modification of the predictor selection programs previously reported. The process utilizes a form of the general matrix reduction theorem developed by Horst and previously reported. The extent of the modification has been to include the following changes in procedure: (1) detection of the predictor variable with the least contribution to the coefficient of predictive efficiency, (2) retainment of any number of the predictor variables until those not designated have been removed from the battery, (3) acceptance of input matrices that have been multiplied by scaling factors. Absolute or differential elimination may be employed.

ON THE ABSOLUTE MINIMUM WEIGHT DESIGN OF FRAMED STRUCTURES, by Jacques Heyman. Technical rept. no. 36 on Contract Nonr-562(10). May 58, 21p. 3 refs. C11-36; AD-159 730.
Order from LC mi$2.70, ph$4.80 PB 139 064

The following theorem is discussed: if the cross section of the members of a frame is varied continuously so that the strength of the frame follows the bending moment diagram, then, provided the design is carried out in a certain way, the frame will have absolute minimum material consumption. The theorem is applied to determine the minimum weight of some simple continuous beam systems. A trial and error relaxation technique was developed which balances angles of rotation at supports. One of the problems is solved numerically to illustrate the technique. The designs are compared with more practical designs in which the cross-section of the members varies discontinuously.

INVESTIGATION OF RESISTANCE AND BEHAVIOR OF REINFORCED CONCRETE MEMBERS SUBJECTED TO DYNAMIC LOADING, by A. Feldman and C. P. Siess. Rept. on Contract DA 49-129-eng-344. 30 Sep 56, 158p. 5 refs. Civil Engineering Studies, Structural Research Series no. 125; AFSWP-929; AD-121 624.
Order from LC mi$7.50, ph$24.30 PB 136 240

The primary objectives of the work described in this report were: to adapt the available equipment and manufacture the additional equipment necessary to carry out the proposed tests; to check the operation of the equipment as individual units and as a unified whole; to develop testing techniques through the testing of pilot beams; and to make analyses of various single-degree-of-freedom systems under different loading pulses to obtain information which will be of value in the interpretation of future tests. Among the additional equipment fabricated were reaction measuring supports which simulate simple support conditions while permitting the measurement of uplift as well as downward reaction. Static tests were made on two beam specimens and provided an adequate evaluation of the behavior and reliability of the loading, measuring, and recording equipment.

ON THERMALLY STRESSED ELASTIC-PLASTIC SHELLS, by E. T. Onat and S. Yamantürk (Brown U. Div. of Applied Mathematics). Technical rept. no. 12 on Contract Nonr-562(20). May 59, 26p. 5 refs.
Order from LC mi$2.70, ph$4.80 PB 146 169

The elastic-plastic behavior of rotationally symmetric sandwich shells is considered in the presence of the thermal effects arising from thermal straining and the temperature dependence of the yield strength. The mathematical nature of the problem is discussed in some detail for the case of cylindrical shells. (Author)

Illinois U., Urbana.
THEORY OF NON-HOMOGENEOUS ANISOTROPIC ELASTIC SHELLS SUBJECTED TO ARBITRARY TEMPERATURE DISTRIBUTION, by R. E. Miller, A. P. Boresi, and H. L. Langhaar. Technical rept. no. 4 on Contract Nonr-1834(14). Apr 59, 67p. 11 refs. T. & A. M. Rept. no. 143.
Order from LC mi$3.90, ph$10.80 PB 145 784

This paper presents a general theory for small deformations of anisotropic elastic shells subjected to arbitrary temperature distribution. The shells are assumed to be homogeneous through the thickness except for the coefficient of thermal expansion but are otherwise unrestricted with regards to homogeneity and isotropy. The theory is specialized for arbitrary cylinders, circular cones, spheres, and axially symmetrical orthotropic shells of revolution. In addition, two special problems are analyzed. (Author)

ON SAINT-VENANT'S PRINCIPLE: ELASTIC SHELLS AND PLATES, by P. M. Naghdi. Technical rept. no. 1 on Contract Nonr-222(69). Apr 59, 23p. 20 refs. Series no. 131, issue no. 1.
Order from LC mi$2.70, ph$4.80 PB 146 081

This investigation is concerned with an examination of the validity of Saint-Venant's principle in the theory of thin elastic shells and plates. With the aid of an integral formula derived for the displacements and their relevant partial derivatives of all orders at a fixed point of the shell middle surface, the conclusions reached may be roughly stated as follows: If the loads acting on the shell maintained in equilibrium are purely edge loads, then the orders of magnitude of the displacements and stresses are in accord with the traditional statement of Saint-Venant's principle. On the other hand, if the loads on the shell are purely surface loads, then the conclusions concerning the orders of magnitude of the displacements and stresses are the same as those of the modified Saint-Venant principle. (Author)

Institute of Flight Structures, Columbia U., New York.
EFFECT OF VARIATION OF VISCOSITY ON CREEP DEFLECTIONS OF COLUMNS, by G. W. Dillon, Jr. Technical rept. no. 8 on Contract Nonr-266(34). June 59, 46p. 27 refs. CU 2-59-ONR-266(34)-CE; AD-225 531.
Order from LC mi$3.30, ph$7.80 PB 146 514

The problem considered is that of a long column of rectangular cross section of a nonhomogeneous, nonlineraly viscoelastic (Maxwell) material. The nonhomogeneity considered is an exponential variation of the fluidity in the thickness coordinate of the bar. This type of variation might be caused by a linear temperature gradient across the bar. An approximate solution is obtained which yields finite values of the column lifetime (critical time) for a nonlinear material.

Polytechnic Inst. of Brooklyn, N. Y.
ON A COMPARISON OF ELASTICITY AND SHELL THEORY SOLUTIONS, by Jerome M. Klosner and Joseph Kempner. Rept. on Contract Nonr-839(17). May 59, 35p. 14 refs. PIBL rept. no. 493.
Order from LC mi$3.00, ph$6.30 PB 145 726

A shear deformation shell theory is applied to the problem of a long circular cylindrical shell subjected to a uniform circumferential radial line load. Comparisons of the resulting stresses and displacements are then made with the results of the elasticity solution for a ratio of inner to outer radius of the shell equal to 0.9. Classical shell theories are also used in the comparison. (Author)

IMPACT AND MOVING LOADS ON A SLIGHTLY CURVED ELASTIC HALF SPACE, by A. Cemal Eringen and J. Clifton Samuels. Technical rept. no. 13 on Contract Nonr-1100(02). Jan 58, 29p. 1 ref. AD-153 619.
Order from LC mi$2.70, ph$4.80 PB 139 313

Two-dimensional Fourier transforms are employed to threat the two-dimensional dynamic problem of elastic half space having a slightly wavy boundary. The various boundary curves considered include square and triangular-bumps and holes and sinusoidal and periodic boundaries. The number of different types of surface loadings considered are (i) normal tractions and zero shear, (ii) impulsive normal tractions and zero shear, (iii) suddenly applied normal tractions and zero shear, (iv) concentrated normal load and zero shear, (v) concentrated impulsive load and zero shear, (vi) pulsating normal load and zero shear, (vii) moving loads, (viii) pulsating moving loads, (ix) vertical and horizontal loads, (x) moving vertical loads. Stress and displacement components for special cases of the loads described in (i), (iii), (vi), and (vii) acting on a sinusoidal boundary lead to a solution which requires evaluation of a single indefinite integral. Closed form results are given for a uniform pulsating pressure load. (Author)

A GENERALIZATION OF THE PHASE RELATIONS IN A FORCED HARMONIC OSCILLATOR, by B. A. Fleishman. Rept. on Contract AF 49(638)514. 18 Dec 59, 12p. 2 refs. MathRep. no. 30; AFOSR-TN-59-1178.
Order from LC mi$2.40, ph$3.30 PB 145 999

When a simple harmonic oscillator is subjected to a sinusoidally varying external force whose frequency is different from the natural frequency of the oscillator, there is a simple and well-known phase relation between the purely forced response and the forcing function. They will have the same or opposite signs (except when both functions vanish) according as the forcing frequency is less or greater than the natural frequency. It is shown here that when the sinusoidal forcing function is replaced by any member of a wide class of periodic functions, the relation between the signs of the forcing function and the forced response continues to hold when the forcing frequency is greater than the natural frequency, but no longer holds in the other case. THE MIXING OF VAPOR AND LIQUID JETS, by Joseph Levy. Rept. for 1 July 56-15 Oct 57 on Contract Nonr-869(00). 15 Oct 57, 69p. 4 refs. Rept. no. 1344 (Final); AD-152 896.
Order from LC mi$3.90, ph$10.80 PB 138 085

This study includes an experimental investigation of the processes that occur in the mixing of high-velocity jets of steam and water. The study was aimed at the accumulation of data which may shed light on the mechanism of mass, momentum, and heat transfer in such systems. The present report describes the work during which substantial improvements in the instrumentation were achieved and several series of tests were made. The results of these tests provide precise and detailed information on the processes that occur during the mixing of high-velocity jets of vapor and of cold liquid. The system studied consisted of a central, circular, steam jet surrounded by an annular jet of high-velocity water. The investigations consisted of: A. Traverses across the jets, at various distances from the nozzles, to measure the stagnation temperature, stagnation pressure, and static pressure. B. Traverses along the jet centerline, to measure the same quantities as in A, above. C. Measurements of the total momentum of the resultant water jet downstream of the mixing and condensing region.

AN EXPERIMENTAL INVESTIGATION OF SUPERSONIC WING-BODY INTERFERENCE AND COMPARISON WITH SECOND-ORDER THEORY, by Georg Drougge and Marten T. Landahl. Technical note no. 2 on Contract AF 61(052)75. Dec 59, 26p. 6 refs. Rept. AU-II-93: 2; AFOSR-TN-60-257.
Order from LC mi$2.70, ph$4.80 PB 145 854

Approximate second-order solutions for the supersonic flow around wing-body combinations were calculated using two different theoretical models. An approximate formula common to the two models was also found for the second-order interference term. In order to test the theory, wind-tunnel experiments on non-lifting cone-cylinder bodies in combination with wings of simple shapes were performed and are described in the present report. Pressure distributions were measured at M = 3 and M = 4, both around the bodies and on the wings separately, as well as in combination, and it was found that the second-order interference was predicted quite well by the simplified theory. "MORGANDYNE" HEAT-TRANSFER TRANSDUCER AND A FLAME-TORCH CALIBRATION TECHNIQUE FOR HYPERVELOCITY WIND TUNNELS, by Charles C. Morgan and Jack C. Andrews. Rept. on ARO, Inc., Contract AF 40(600)800. Feb 60, 73p. 6 refs. AEDC-TR-60-1. AD-232 236.
Order from LC mi$4.50, ph$12.30 PB 145 750

This report describes the transducers and related calibration equipment used to measure the transient heat transfer rates in the arc-heated Hotshot hypervelocity wind tunnels. Thermistor and thin film gages are described briefly, and a variable reluctance Morgandyne gage is covered in detail. Water jet and oxyacetylene torch equipment for the calibration of transient heat transfer gages is described. The torch calibration system has been developed for heat transfer rates from 90 to 400 Btu/ft^2-sec. (Author)

ONE-DIMENSIONAL EQUILIBRIUM SPECTRA IN ISOTROPIC TURBULENCE, by W. H. Reid. Technical rept. no. 27 on Contract Nonr-562(07). May 59, 29p. 12 refs. 562(07)/27.
Order from LC mi$2.70, ph$4.80 PB 145 977

The one-dimensional equilibrium spectra in isotropic turbulence are given for the physical transfer theories of Heisenberg, Kovásznay, and Obukhoff. These results are then compared with the experimental measurements of the spectrum of $\partial u_1/\partial x_1^3$ fluctuations. For two of the theories (Heisenberg's and Kovasznay's) reasonable agreement is obtained for $k\eta < 0.4$ but for larger values of $k\eta$ there is considerable divergence between the theoretical and experimental results. The relationship between the equilibrium and similarity spectra are also discussed for these two theories. (Author)

INTERACTION OF A TWO-DIMENSIONAL INVISCID INCOMPRESSIBLE JET FACING A HYPERSONIC STREAM, by S. H. Lam. Rept. on Contract AF 49(638)465. Mar 59, 34p. 3 refs. Rept. no. 447; AFOSR-TN-59-274; AD-212 708.
Order from LC mi$3.00, ph$6.30 PB 146 018

At hypersonic speeds, if one protrudes a thin spike from the nose of a blunt body, such that the spike is at zero angle of attack with respect to the oncoming stream, the boundary layer on the spike will thicken and separate before it reaches the nose of the blunt body, and it will reattach somewhere downstream on the shoulder of the blunt body. The flow pattern is drastically different from that of a flow over a blunt body without a spike, since the hypersonic flow now effectively flows over a rather slender body. The drag is greatly reduced, and preliminary data show that the heat transfer rate to the blunt body itself is greatly reduced also. The hot spot on this spike-blunt body configuration is now at the tip of the thin spike (and probably also on the part of the spike before separation occurs) which must be protected by suitable cooling.

James Forrestal Research Center, Princeton, N. J.
SHOCK INDUCED UNSTEADY LAMINAR COMPRESSIBLE BOUNDARY LAYERS ON A SEMI-INFINITE FLAT PLATE, by Sau-Hai Lam and Luigi Crocco. Rept. on Contract AF 18(600)498. Sep 58, 111p. 19 refs. Rept. no. 428; AFOSR-TN-58-581; AD-162 101.
Order from LC mi$6.00, ph$18.30 PB 146 017

The physical problem under study in this report is the shock induced two-dimensional unsteady laminar compressible boundary layer on a semi-infinite flat plate. The shock is considered to have constant strength and it advances into a quiescent gas. The flat plate is at zero incidence and is at rest.

Laboratorio di Meccanica Applicata del Politecnico di Torino (Italy).
TRANSONIC FLOWS PAST SYMMETRICAL AIRFOILS WITH ATTACHED SHOCK WAVE ($M_\infty < 1$); PART II, by Silvio Nocilla. Technical note 9 on Contract AF 61(514)1124. July 58, 28p. 5 refs. AFOSR-TN-58-943; AD-205 083.
Order from LC mi$2.70, ph$4.80 PB 138 056

The present paper pursues a recent study of the A. and extends to the whole field the determination of the transonic flow past symmetrical airfoils at high subsonic free Mach number, with attached shock wave. The developed theory is then applied to the study of "Tomotika - Tamada's profiles" for which the velocity-distribution on the profile, the sonic line and the shock line are numerically determined. (Author) (See also PB 134 861)

A NEW SIMPLIFIED FORM OF NAVIER-STOKES EQUATIONS FOR CURVILINEAR FLOWS, by Maneshwar Chandra Mathur. Research rept. no. 24 on Contract Nonr-978(01). 30 May 59, 74p. 6 refs. AD-225 177.
Order from LC mi$4.50, ph$12.30 PB 146 258

The flow around elliptical inlets having leading edges of small radii of curvature was studied. By measuring the order of magnitude of terms in the Navier-Stokes boundary layer equations for curvilinear flows, it was found that the second Navier-Stokes equation as simplified by Tollmien was not valid in the region of separation on the leading edge. Two additional terms were found which should be included in the second Navier-Stokes equation for curvilinear flows. The equations were then simplified to a new form. (Author)

Princeton U., N. J.
APPROXIMATE SOLUTIONS FOR SUPERSONIC FLOW OVER WEDGES AND CONES, by A. G. Hammitt and K. R. A. Murthy. Rept. on Contract AF 49(638)465. Apr 59, 25p. 7 refs. Rept. no. 449; AFOSR-TN-59-304; AD-213 088.
Order from LC mi$2.70, ph$4.80 PB 146 007

Approximate solutions for the supersonic flow of a gas at relatively high Mach numbers over wedges and cones are presented. These methods provide simple and accurate results over a wide range of Mach number and specific heat ratios.

Rosemount Aeronautical Labs., U. of Minnesota, Minneapolis.
AERODYNAMIC INVESTIGATION OF SLED CONFIGURATIONS FOR THE HOLLOMAN TRACK, by Rudolf Hermann, Frederick Moynihan, and Walter Melnik. Rept. on Contract AF 29(600)1227. June 59, 210p. 19 refs. AFMDC-TR-59-18.
Order from LC mi$9.30, ph$31.80 PB 145 739

Results of wind tunnel and theoretical investigations of the aerodynamic characteristics of supersonic sleds are presented and discussed. The wind tunnel investigation consists of lift, drag, and pitching moment measurements for families of rectangular and circular cross-section sleds mounted on a simulated Holloman track. Sled geometric variables studied include the effects of height above the trough, slipper beams, nose shape, body shape, body width, body thickness, body length, and angle of attack. For all sled configurations, the ground effect results in positive lift forces and for many the lift is on the order of and even larger than the drag. Some general conclusions to minimize the lift and drag are: keep the sled bottom at or above the rail level; use a semi-pyramid nose with the flat side down; make the sled bottom rounded with the generatrix parallel with the ground; use a body width about three-fourths of a track width; keep the body thickness as small as possible, and if necessary to further reduce the lift, use a small negative angle of attack.

Rosemount Aeronautical Labs., U. of Minnesota, Minneapolis.
BOUNDARY LAYER TRANSITION WITH GAS INJECTION, by C. J. Scott and G. E. Anderson. Rept. on Contract AF 18(600)1226. July 58, 32p. 24 refs. Research rept. no. 151; AFOSR-TN-58-786; AD-202 112.
Order from LC mi$3.00, ph$6.30 PB 145 740

Experiments were conducted on a porous 16° cone at Mach number of 3.7 to ascertain the effects of gas injection on the stability of the laminar boundary layer. Observed zero-heat-transfer transition Reynolds numbers decrease with increased injection but this effect was overcome by the cooling possible with injection. (Author)

INTEGRAL LAMINAR BOUNDARY LAYER SOLUTIONS USING THE CROCCO VARIABLES, by C. J. Scott. Rept. on Contract AF 18(600)1226. Aug 59, 23p. 18 refs. Engineering memo. no. 86; AFOSR-TN-59-1304.
Order from LC mi$2.70, ph$4.80 PB 145 775

An analysis is presented which predicts the skin friction and surface heat transfer characteristics of a compressible laminar boundary layer. The present formulation is restricted to constant specific heat and Prandtl number and a linear variation of fluid viscosity with temperature. Regions where the analysis may be extended are pointed out. For the injection cases considered, the coolant gas is considered to be identical to the main stream fluid. Numerical examples are presented for constant pressure, impermeable and permeable surfaces, with upstream and downstream transpiration cooling and strip injection. Surface temperature distributions are presented for the case of constant surface injection with uniform reservoir temperature. In the cases where similarity exists, the method is tested by comparisons with exact solutions which are free from the limitations of the present analysis. (Author)

Rosemount Aeronautical Labs., U. of Minnesota, Minneapolis.
LAMINAR, TRANSITIONAL AND TURBULENT MASS TRANSFER COOLING EXPERIMENTS AT MACH NUMBERS FROM 3 TO 5, by C. J. Scott, G. E. G. E. Anderson, and D. R. Elgin. Rept. for Nov 54-Aug 57 on Contract AF 18(600)1226. Aug 59, 31p. 20 refs. Research rept. no. 162; AFOSR-TN-59-1305.
Order from LC mi$3.00, ph$6.30 PB 145 760

A summary is presented of experimental research work on porous-wall mass transfer cooling effects. Two coolants, air and helium, were included in all of the investigations. Laminar, transitional, and turbulent boundary layers on constant pressure surfaces were investigated using flat plates and cones. A porous hemisphere was used to examine the effect of non-uniform surface pressure. The experimental results covering relatively low temperatures and low speeds confirm analytical boundary layer predictions on the relative effectiveness of the two gases in reducing heat transfer although quantitative agreement does not exist. The available theories do not correctly indicate the general trends of experimental temperature recovery factors. Transition Reynolds number decreases caused by injection could be overcome by the cooling made possible by the injection process. Both laminar and turbulent boundary layers could be "blown-off" the bodies by excessive coolant injection. (Author)

Rosemount Aeronautical Labs., U. of Minnesota, Menneapolis.
MASS TRANSFER COOLING EXPERIMENTS ON A HEMISPHERE AT M=5, by G. E. Anderson, C. J. Scott, and D. R. Elgin. Rept. on Contract AF 18(600)1226. Aug 59, 31p. 16 refs. Research rept. no. 166; AFOSR-TN-59-1306; AD-231 975.
Order from LC mi$3.00, ph$6.30 PB 145 788

A segmented, porous hemisphere was designed and constructed to provide a constant temperature surface with helium mass transfer cooling. The variation of surface heat transfer with helium injection rate and with position on the hemisphere surface was measured. The data is presented along with available analytical results. (Author)

Technische Hochschule, Munich (West Germany).
A NUMERICAL APPROACH TO THE QUESTION OF STABILITY OF SUPERSONIC ENCLOSURES IN AN OTHERWISE SUBSONIC FLOW FIELD, by Wolfgang Werner. Technical note no. 12 on Contract AF 61(514)1080. 7 Dec 59, 36p. AFOSR-TN-60-256.
Order from LC mi$3.00, ph$6.30 PB 145 855

Information is given on a numerical investigation of stability of transonic flows past a profile. An "exceptional" solution is calculated describing a steady, continous transonic flow. This solution is used as initial data for a time dependent numerical calculation. Result seems to indicate existence of stable transonic flows with shocks. (Author)

Technische Hochschule, Karlsruhe (West Germany).
THEORETICAL INVESTIGATIONS ON RING AIRFOILS, by Johannes Weissinger. Rept. on Contract AF 61(514)1207. Jan 60, 115p. 10 refs. AFOSR-TN-60-343.
Order from LC mi$6.00, ph$18.30 PB 146 435

The effects of interference between a ring airfoil and a slender central body are studied. Simple formulas for the lift and the pitching moment are derived from a more thorough theory by considerations taken from lifting line and three quarter point theory. Numerical results are given for ellipsoidal bodies. Two methods for computing the three-dimensional laminar boundary layer on ring airfoils are developed. The first is based on an expansion with respect to the angle of attack, the second is an iteration procedure. In both methods a v. Kármán-Pohlhausen procedure is used. The wall streamlines and the separation line are shown. (Author)

THE MOTION OF A SUBMERGED BODY MOVING VERTICALLY TOWARDS A FREE SURFACE, by T. C. Woo. Technical rept. no. 28 on Contract Nonr-562(07). May 59, 28p. 5 refs. 562(07)/28.
Order from LC mi$2.70, ph$4.80 PB 146 260

The motion of a submerged body moving vertically upwards towards a free surface is treated by three methods. In the image method we approximate the boundary condition on the free surface and thus obtain the velocity potential, the velocity field, etc., by properly adjusting the motion of an image sphere. In the second method use is made of the relation between the velocity potential and the corresponding impulsive pressure system. The last method gives some preliminary results treating the problem in the Lagrangian description of fluid motion. (Author)

Brown U. Div. of Applied Mathematics, Providence, R. I.
REFRACTION SHOCK WAVES IN A NON-UNIFORM OCEAN, by Maurice Holt and Sainsbury L. Strack. Technical rept. no. 18 on Contract Nonr-562(07). May 59, 15p. 3 refs. 562(07)/18.
Order from LC mi$2.40, ph$3.30 PB 146 255

In an ocean the temperature is approximately constant in a shallow layer near the surface; below this layer the temperature decreases with depth. As a result when an explosion is initiated at a point in the non-uniform part of the ocean marked refraction effects occur. These are especially noticeable in the shadow zone formed below the boundary between the uniform and non-uniform regions. Near the source of the explosion the pressure pulse has the usual shape of initial peak followed by exponential decay. In the shadow zone, however, the pulse shape is changed and the initial pressure jump at the head of the wave is followed by a further continuous increase to a maximum behind the front.

THE MACHINABILITY OF AUSTENITIC MANGANESE STEELS, by Howard S. Avery and Henry J. Chapin. Final summary rept. on Contract NObs-72243. 15 Sep 58, 185p. 51 refs. Metallurgical Dept. Case rept. 1122-5; AD-214 726.
Order from LC mi$8.40, ep$30.30 PB 146 814

Machinability equivalent to that of 304 (19Cr:9Ni) stainless steel together with the strength, economy and non-magnetic properties of 12% manganese steel were sought. The effects of lead, silver, sulfur, selenium, bismuth, zirconium, and carbon were investigated. Of these, bismuth and lower carbon seemed most fruitful. The objectives were considered met by a 20% manganese steel with 0.60%C to which 1% bismuth was added, with a recovery of 0.2-0.4%Bi. This alloy could be lathe turned at 265 SFM, threaded, drilled and tapped. Force requirements and friction in machining are well below those of standard Hadfield's manganese steel. After toughening by water quenching from about 1900°F. this steel is non-magnetic, has Izod impact resistance above 55 foot-lbs., yield strength from 35,000 to 45,000 psi, tensile strength above 87,000 psi and elongation of 40% or more.

BRAZING FOR HIGH-TEMPERATURE SERVICE, by A. F. Haskins and R. M. Evans. 29 Mar 60, 15p. 62 refs. DMIC memo. 48.
Order from OTS $0.50 PB 161 198

The purpose of this memorandum is to summarize the extent of advancement in the field of brazing for service temperatures in excess of 600 F. In recent years, the need for parts fabricated from high-temperature, high-strength corrosion-resistant alloys has imposed a demand for brazing filler metals which are compatible with these base metals and their usage usage. The joining of complex structures has, in many cases, demanded that these filler metals be used without flux and that departures from the conventional brazing processes be made. This memorandum is designed to summarize available technical information on the brazing process and the brazing filler metals used to join these high-temperature materials. Because of the volume of literature available, it is impossible to include the tabular and graphical presentations which are so important. Therefore, a rather complete bibliography of source material is included.

STUDY OF THE REACTIONS OF THIOUREA IN PICKLING SOLUTIONS UTILIZING RADIOTRACER METHODS, by T. F. Boyd and M. Galan. Feb 59, 17p. 2 refs. Research and Development rept. no. 6200D-5; AD-214 298.
Order from LC mi$2.40, ph$3.30 PB 145 834

The amount of thiourea adsorbed on steel during pickling was determined by radiotracer techniques. Small amounts of thiourea were chemisorbed on the steel. Dissolution of the steel was proportional to acid concentration and time in pickling bath and independent of iron concentration. Inhibition increased rapidly at low concentrations of thiourea, up to about 30 mg/L. The inhibition increased at a significantly lower rate with higher concentrations. When the pickling bath was operated continuously most of the thiourea was decomposed or lost from the solution by

carryout on the steel; only a small amount was accounted for by adsorption on the steel. (Author)

MAGNETIC VISCOSITY AND ANNEALING IN MAGNETIC FIELD. THEORY OF THE MAGNETIC VISCOSITY DUE TO SOLUTE ATOM PAIRS, by Giuseppe Biorci, Andrea Ferro, and Giorgio Montalenti. Technical rept. 3a on Investigation of Magnetic Relaxation Due to Rotation of Couples of Solute Atoms, Contract AF 61(514)1331. Nov 59, 104p. 73 refs. AFPSR-TN-60-193.
Order from LC mi$5.70, ph$16.80 PB 145 861

The diffusion viscosity due to the rotation of couples of solute atoms in alloys is studied. The relationship between annealing of alloys in a magnetic field and magnetic after-effect is established. The theory has been tested on Fe-Si and Fe-Al alloys of various compositions.

Watertown Arsenal Labs., Mass.
LOW TEMPERATURE PLASTIC FLOW AND FRACTURE TENSION PROPERTIES OF HEAT-TREATED SAE 4340 STEEL, by Frank R. Larson and John Nunes. Dec 59, 56p. 35 refs. Technical rept. no. WAL TR 834.2/1; AD-231 700.
Order from LC mi$3.60, ph$9.30 PB 145 890

True-stress true-strain tension properties of a heat-treated SAE 4340 steel were obtained at a testing speed of 0.01-inch per minute over a range of temperatures from +200° to -196°C. The flow stress at a constant true strain is closely described by a reciprocal absolute temperature function.

METALLURGICAL APPLICATIONS OF ELECTRON PROBE ANALYSIS, by David B. Wittry. Interim technical rept. no. 6 on Design and Development of an Electronic X-Ray Probe for the Study of Alloys and of the Structure of Metals, Contract DA 04-495-ORD-1076. Dec 59, 21p. 16 refs. OOR rept. 1920. 1-Met.
Order from LC mi$2.70, ph$4.80 PB 145 724

The concentration profile of chromium in chromized iron. Analysis of the widmanstatten structure in meteoritic iron. Phase identification in titanium-copper and titanium-silver alloys. Concentration fluctuations in solid solution alloys.

Climax Molybdenum Co. of Michigan, Detroit.
DEVELOPMENT OF HIGH STRENGTHS AND HIGH RECRYSTALLIZATION TEMPERATURES IN MOLYBDENUM-BASE ALLOYS, by M. Semchyshen, Gordon D. McArdle and Robert Q. Barr. Rept. on Metallic Materials, Contract AF 33(616)2861. Feb 59, 128p. 9 refs. WADC-TR-58-551; AD-209 383.
Order from OTS $2.75 PB 161 542

Initial studies involved higher alloy castings than had previously been evaluated. Evaluation of the soundness, machinability, hot hardness and forgeability, practicability of preparing large castings in the consumable electrode equipment, and extrusion of large bodies of molybdenum. The most outstanding molybdenum-base alloy developed during this program contained 0.46% titanium, 0.08% zirconium and 0.08% carbon. The alloy required one hour at 2950 F for complete recrystallization. In the stress-rupture test, this alloy required 79,000 psi at 1800 F for rupture in 100 hours. In addition to the ternary alloy, promising elevated temperature properties were exhibited by binary alloys containing 2.00% titanium, (0.14% carbon), and 0.3 and 0.5% zirconium (0.022 carbon).

Dow Chemical Co., Midland, Mich.
PROTECTIVE COATINGS ON MAGNESIUM ALLOYS INTENDED FOR USE ON COMPONENTS OF AIRBORNE VEHICLES. Final rept. for 1 July 57-1 Oct 58 on Contract DA 20-018-ORD-15406. [1958] 11lp. AD-215 169.
Order from LC mi$6.00, ph$18.30 PB 146 617

Studies of various metallic coatings for corrosion compatibility with magnesium indicated that tin is superior to all other plates. Combination plates of tin and/or alloys with other metals also were good such as tin-lead, tin-nickel, tin-chromium, tin-zinc and tin-cadmium. Indium also was relatively compatible. Tin plates as thin as 0.0002" were effective. All of these coatings were better than the now commonly used cadmium or zinc as a coating for steel (Fe) fasteners. Tin metallic powder in paint, hot metal spray coatings of tin and tin shims also provided an improved result. Very high purity aluminum gave excellent compatibility when used as a solid fastener but when electrodeposited over steel was quite ineffective. Combinations of a compatible metallic coating and an organic paint coating were more effective than either alone.

Illinois U., Urbana.
FACTORS INFLUENCING FRETTING FATIGUE STRENGTH, by H. T. Corten. Technical rept. no. 46 on The Behavior of Materials under Repeated Stress, Contract N6ori-071(04). June 55, 35p. 17 refs. T & AM rept. no. 88; AD-68 087.
Order from LC mi$3.00, ph$6.30 PB 146 578

The influence of clamping pressure on the fretting fatigue strength of 24S-T aluminum alloy was investigated. The strength was reduced to approximately 50 per cent of the unfretted fatigue strength due to clamping between aluminum clamping pads at a nominal pressure of 4000 psi. The influence of dissimilar clamping pad materials, including aluminum, brass, soft and hard steel, on the fretting endurance limit of hard steel was investigated. The strength of the hard steel specimens, due to fretting against aluminum, soft steel, brass, and hard steel clamping pads, was reduced to 91 per cent, 81 per cent, 59 per cent, and 50 per cent, respectively, of the unfretted endurance limit.

Illinois U., Urbana.
A STUDY OF THE MECHANISM OF FRACTURE IN TORSION, by P. G. Jones and T. J. Dolan. Final rept. on Contract Nonr-1774(01). May 56, 46p. 9 refs. T & AM rept. no. 97; AD-111 222.
Order from LC mi$3.30, ph$7.80 PB 146 576

An experimental investigation was conducted to determine the influence of the amount of available elastic strain energy on the shear fracture characteristics of several metals. Torsion tests were made on solid 1/2 in. cylindrical specimens notched to a root diameter of 3/8 in. Values of strain energy release rate for sudden fracture with no plastic deformation were determined for SAE 8727 Steel and were found to be considerably lower than those reported in the literature for tension and bending of various steels.

Illinois U., Urbana.
A WIRE FATIGUE MACHINE FOR INVESTIGATION OF THE INFLUENCE OF COMPLEX STRESS HISTORIES, by H. T. Corten and G. M. Sinclair. Technical rept. no. 41 on The Behavior of Materials under Repeated Stress, Contract N6ori-71(04). Apr 55, 31p. 6 refs. T & AM rept. no. 81; AD-64 455.
Order from LC mi$3.00, ph$6.30 PB 146 577

A wire fatigue testing machine that operates on the principle of a deflected rotating strut was designed to investigate fatigue life for complex stress histories, particularly those consisting of repeated blocks of cycles. For a comparative study of material behavior, wire fatigue testing incorporates several particularly desirable features, namely inexpensive specimens and small scatter of data.

Materials Lab., Wright Air Development Div., Wright-Patterson AFB, Ohio.
AN INVESTIGATION OF THE RELATIONSHIP OF HOT-HARDNESS TO THE ELEVATED TEMPERATURE EXTRUSION BEHAVIOR OF SELECTED ARC-CAST MOLYBDENUM BASE ALLOYS, by John Robert Giancola. Rept. for 1 Jan-1 Nov 59 on Metallic Materials. Feb 60, 133p. 41 refs. WADD Technical rept. 59-26.
Order from OTS $2.75 PB 161 669

A study was conducted to determine the relationship between the hot hardness and the required extrusion forces and percent yield of sound material for molybdenum and molybdenum base alloys. The extrusion force was measured while the controllable variables were held constant. It was found that no definite relationship between hot hardness and the extrusion forces or yield of wound metal could be established. Extrusion and hot hardness data are presented for

unalloyed Mo, Mo-Ti, and Mo-Ti-Zr alloys along with apparent relationships between the extrusion temperature and both the average extrusion force and the percent yield. (Author)

Michigan U. Research Inst., Ann Arbor.
STUDIES OF HEAT-RESISTANT ALLOYS, by A. Phillip Coldren, Jerry E. White and others. Rept. for 15 Mar 58-15 June 59 on Refractory Metals, Contract AF 33(616)5466. Feb 60, 108p. 13 refs. WADC Technical rept. 59-606.
Order from OTS $2.50 PB 161 667

Results are reported for an investigation that was carried out to show the effect of hot working on the structure and properties of heat-resistant alloys. The rupture strength of hot rolled "A" Nickel at 100°F seemed to depend primarily on substructure; internal lattice strains as measured by hardness were relatively unimportant. At 800°F the creep resistance of "A" Nickel appeared to depend on internal strains and substructures more or less equally. The rupture properties of A-286 at 1200°F and 1350°F in the hot-rolled plus heat-treated condition could not be correlated with the small variations in the state of the γ'precipitate that were observed. A rough correlation was found between grain size and properties. In a ferritic steel ("17-22-A"V) an improvement in properties was effected by rolling austenite at temperatures too low for recrystallization. In a study of strain aging effects, results of constant-strain-rate tension tests on low carbon steel and A-286 Alloy suggested that forces of chemical attraction between N atoms and Si, Al, or Ti atoms stabilize Cotrell-type atmospheres, permitting them to be effective at higher-than-normal-temperatures. (Author)

Naval Ordnance Lab., White Oak, Md.
SOME ELEVATED TEMPERATURE PROPERTIES OF PRECIPITATION HARDENABLE IRON-ALUMINUM ALLOYS, by W. J. Buehler and C. G. Dalrymple. 8 Jan 60, 19p. 7 refs. NAVORD rept. 6728.
Order from OTS $0.50 PB 161 543

The effects of titanium and titanium plus carbon on some of the elevated temperature properties of the binary iron-aluminum alloys were studied. In every case the titanium-bearing alloys were evaluated in the precipitation hardened condition. A binary 8% aluminum-iron alloy, incapable of precipitation hardening, was used as a control. The data reveal that the titanium additions, when effectively utilized as a stable precipitated second phase, greatly increase the stress-rupture properties of an iron-aluminum alloy containing 8 percent aluminum by weight. (Author)

Naval Research Lab., Washington, D. C.
FACTORS INFLUENCING THE LEAD CORROSIVITY OF DIESTER-BASE OILS, by C. M. Murphy, H. Ravner, and C. O. Timmons. Interim rept. 29 Feb 60, 21p. 21 refs. NRL Rept. 5451.
Order from LC mi$2.70, ph$4.80 PB 144 526

The increase of lead corrosivity during storage of diester-base oils of Specification MIL-L-7808 prevents the stockpiling of adequate reserves. Lead corrosion is due to the progressive formation of the acid half ester (2-ethylhexyl hydrogen sebacate) resulting from the hydrolysis of sebacic acid diesters. Diester hydrolysis is catalyzed by acid phosphates, present in or formed from tricresyl phosphate, the antiwear additive. Aliphatic amines effectively neutralize these strong acids, thus negating their catalytic action. The most positive and generally applicable method of preventing diester oil deterioration is to exclude moisture. (Author)

Nepa Div., Fairchild Engine and Airplane Corp., Oak Ridge, Tenn.
THE SOLUBILITY OF METALS AND ALLOYS IN LEAD-BISMUTH EUTECTIC AT TEMPERATURES UP TO 2200°F, by John F. Collins and H.R. Stephan. 12 Apr 51, 13p. 1 ref. NEPA 1803.
Order from LC mi$2.40, ph$3.30 PB 146 224

A survey of readily available high temperature alloys and metals was made with respect to their solubility in lead-bismuth eutectic. The temperature range of 900° to 2200°F, for times up to 100 hours was investigated. Selected stainless steels, special alloys, and refractory metals were tested by the agitated capsule method developed at NEPA. Evidence of selective solubility of nickel and manganese makes the high nickel alloys undesirable. A. I. S. I. Type 446 showed the least solubility among the alloys and molybdenum was the most resistant of the metals tested. (Author)

Northwestern U. [Evanston, Ill.]
DISLOCATION THEORY OF STRAIN AGING, by T. Mura, E. Lautenschlager and J. O. Brittain. Rept. on Contract AF 18(600)1598. 1 Feb 60, 20p. 6 refs. AFOSR-TN-60-206.
Order from LC mi$2.40, ph$3.30 PB 145 857

The return of the yield point following strain aging is due to the locking of dislocations by a solute atmosphere and is proportional to the number of solute atoms in the atmosphere along the dislocation. The theory was compared with a series of the experiments which were done under several aging temperatures, plastic strains, and aging stresses.

Pitman-Dunn Labs. [Group] Frankford Arsenal, Philadelphia, Pa.
SURVEY OF THE LITERATURE ON SODIUM MODIFICATION OF ALUMINUM-SILICON-MAGNESIUM ALLOYS, by R. C. Harris. Feb 54, 15p. 18 refs. Memo. rept. MR-556.
Order from LC mi$2.50, ph$3.30 PB 146 850

The effects of sodium on the microstructure and mechanical properties of aluminum-silicon alloys are described. From the work done on the subject several theories to account for the microstructural changes have been developed.

NUCLEAR PHYSICS AND NUCLEAR CHEMISTRY

Army Signal Research and Development Lab., Fort Monmouth, N. J.
THE FEASIBILITY OF NUCLEAR SHIELDING FOR ELECTRONIC CIRCUITRY, by Byron S. Gottfried and Alton L. Long. 24 Oct 58, 17p. 8 refs. USASRDL Technical rept. 1996.
Order from LC mi$2.40, ph$3.30 PB 145 754

Although it is possible to shield against nuclear radiation with known materials, there is no single known material which will effectively shield against all types of radiation emanating from an atomic weapon. An effective radiation shield must, therefore, consist of a combination of several materials, each being chosen for a particular type of radiation. Such a radiation shield would be extremely heavy and bulky. The use of special homogeneous mixtures or coatings offers no escape from the large bulk of material needed to shield against radiation. Therefore, while electronic systems may contain a radiation shield, the decision to employ such a shield should be made only when the designer is well aware of the disadvantages and shortcomings of such a design. DIFFERENTIAL ELASTIC NEUTRON SCATTERING CROSS SECTION OF OXYGEN, by H. Lustig. Final rept. for 17 Dec-30 Sep 59 on Contract DA 18-108-405-cml-295. 1 Nov 59, 16p. 19 refs. NDA 2111-3, Vol. A.
Order from LC mi$2.40, ph$3.30 PB 146 777

A set of elastic scattering angular distributions is presented for neutron energies up to 18 Mev. Calculations undertaken for the determination of resonance parameters in the incident neutron energy region from 2.5 to 4.0 Mev are described. (Author)

Ohio State U. Research Foundation, Columbus.
COLLISION CROSS SECTION STUDY OF CO_2, WITH A THEORETICAL STUDY OF TWO TRANSITIONS, by Jerome C. Shiloff and Edwin N. Lassettre. Scientific rept. no. 10 on Contract AF 19(122)642. July 57, 101p. 41 refs. AFCRC-TN-58-234; AD-228 596.
Order from LC mi$5.70, ph$16.80 PB 139 347

Differential collision cross section and generalized oscillator strengths were determined for 8 peaks in the CO_2 spectrum and at 9 excitation energies in the ionized continuum extending to 79.0 ev. Electrons of incident kinetic energy of about 500 ev are employed throughout. Two weak transitions at about 8.6 and 9.2 ev excitation energy were studied in detail. These transitions are so weak as to suggest that they would be forbidden except for vibrational distortion of the carbon dioxide molecules. Selection rules were treated in detail and a tentative assignment was made. (Author)

Palmer Physical Lab., Princeton U., N. J.
A COUNTER-CLOUD CHAMBER INVESTIGATION OF K^+ MESONS PRODUCED IN COSMIC RAYS, by Herbert Gursky. Doctoral thesis. Technical rept. no. 23 on Cosmic Ray and Elementary Particles Group Group, Contract Nonr-1858(06). 26 May 59, 124p. 37 refs. AD-218 589.
Order from LC mi$6.30, ph$19.80 PB 145 909

An experiment was carried out in which stopping K mesons were observed in a multiple cloud chamber. Simultaneously the decay lifetimes of the particles were recorded by associated electronic components. The cloud chamber was triggered when one scintillation counter recorded a decay coincidence with respect to another counter within a time interval of 15 to 115 mμ sec.

Pittsburgh U., Pa.
SOME CONSEQUENCES OF THE COMPOUND ION MODEL, by Elizabeth Baranger and Edward Gerjuoy. Technical rept. no. 5 on Capture-Loss and Ionization Cross-Sections of Ions and Neutral Particles, Contract Nonr-624(06). Apr 58, 21p. 22 refs.
Order from LC mi$2.70, ph$4.80 PB 138 611

Cross sections for excitation of atoms levels by electrons often vary sharply with energy near threshold, as if resonating with a state of the compound ion. Some consequences of this "compound ion model" of excitation are explored. In particular it is shown that information bearing on the validity of the model can be obtained from measurements of the angular distribution and polarization of the light emitted following excitation to radiating states. Possible applications to Hg and to He are discussed. (Author)

Physics Research Lab., U. of Illinois, Champaign.
TABLES OF CROSS SECTIONS FOR π^+ PHOTOPRODUCTION FROM HYDROGEN, ACCORDING TO THE THEORY OF CHEW, GOLDBERGER, LOW AND NAMBU, by C. S. Robinson. Technical rept. no. 8 on Contract Nonr-1834(05). 22 May 59, 32p.

IRRADIATION "FACTOR-DEPENDENCY": STYRENE (MONOMER), by Ed. F. Degering, Charles Merritt and others. Nov 59, 38p. 6 refs. Radiation Chemistry Lab. series research rept. no. 1.
Order from LC mi$3.00, ph$6.30 PB 145 707

The irradiation-polymerization of vinyl monomers was selected for the evaluation of parameters, inasmuch as procedures for evaluating the over-all results were well defined for certain systems such as monomeric styrene. Results to date on the irradiation-induced polymerization of monomeric styrene, with variations in the parameters, comprise the material for this report.

Stanford U., Calif.
SIGNS OF THE GRAVITATIONAL MASS OF A POSITRON, by L. I. Schiff. Technical rept. no. 42 on Contract AF 18(600)545. Sep 58, 5p. 4 refs.
Rept. no. 545-42; AFOSR-TN-58-783; AD-202 008.
Order from LC mi$1.80, ph$1.80 PB 137 536

Suggestions are made that an antiparticle may have the opposite sign of gravitational mass from its corresponding particles. Work is presented to point out that this sign can be determined experimentally in the case of a positron. In these experiments the ratio of gravitational to inertial mass was measured for several substances, and the attempt made to detect differences in this ratio between one substance and another. No definite evidence for such differences was found. In several cases, the uncertainties in the fractional differences of the ratios were less than one part in 10^8 (Author)

Willow Run Labs., U. of Michigan, Ann Arbor.
PHOTOGRAPHY OF COSMIC RAY TRACKS WITH A CASCADE LUMINESCENT CHAMBER, by Lawrence W. Jones and Martin L. Perl. Rept. on Proj. Michigan, Contract DA 36-039-sc-78801. May 59, 14p. 8 refs. Rept. no. 2900-11-T; AD-216 789.
Order from LC mi$2.40, ph$3.30 PB 145 892

The tracks of minimum ionizing particles have been photographed in a luminescent chamber for what is believed to be the first time. A cascade luminescent chamber made up of three image tubes coupled with refractive optics has been used to photograph tracks of cosmic ray μ mesons in a sodium iodide crystal. The very high time resolution and postevent triggering achieved through these experiments will facilitate experimentation with impure beams from acceleration and with cosmic rays. This report describes the apparatus with details of measurement on image tube characteristics and the nature of background. The same type of apparatus is applicable to other problems where very weak light signals (several thousand photons total) must be photographed. (Author)

Instruments and Installations

Battelle Memorial Inst., Columbus, Ohio.
NEUTRON DOSIMETRY RESEARCH, by W. S. Diethorn, E. Paskell and others. Quarterly progress rept. no. 3, 15 Sep-14 Dec 57, on Contract DA 36-039-sc-73174. 24 Mar 58, 44p. 16 refs.
Order from LC mi$3.30, ph$7.80 PB 145 939

Systems of personnel neutron dosimetry are being investigated for application in mixed fields of fast-neutron and gamma radiation. In the first phase of the the study, silicon semiconductor devices and compound semiconductors are being prepared and irradiated for the purpose of determining their response to fast neutron doses less than 600 tissue rads. A paper study of ion-chamber performance during short bursts of high-intensity radiation is being conducted in the second phase of the program. The major purpose of this latter study is to determine the effect of ion recombination on chamber performance. (See also PB 137 194)

Battelle Memorial Inst., Columbus, Ohio.
PERSONNEL NEUTRON-DOSIMETRY SYSTEMS, by W. S. Diethorn, E. Paskell and others. Final rept. on Contract DA 36-039-sc-73174. 15 May 58, 44p. 23 refs.
Order from LC mi$3.30, ph$7.80 PB 145 938

In the early stages of the program three dosimetry areas were investigated: semiconductor devices, ion chambers, and chemical recoil-proton systems. The study on chemical recoil-proton dosimeter systems was terminated at the conclusion of a literature survey on this type of dosimeter. Before experimental work on the ion-chamber phase of the program was initiated the objective of this phase was changed, and subsequent efforts were directed toward a paper study of ion-chamber performance in short-burst, high-intensity radiation fields. In the semiconductor phase of the program studies were restricted to silicon and compound semiconductor devices. (See also PB 145 939)

Nuclear Reactions

Pennsylvania U., Philadelphia.
GAMMA-RAY ACTIVATION OF CARBON, by Leonard D. Cohen. Technical rept. no. 5 on Contract Nonr-551(17). [1959] 89p. 51 refs.
Order from LC mi$4.80, ph$13.80 PB 146 290

In this experiment carbon samples were activated by the monochromatic gamma-rays produced by the reaction $T(p, \gamma)He^4$. The gamma-ray energy was varied over the range 20.1 to 21.1 Mev by varying the energy of the protons produced by a Van de Graaff accelerator. The resolution (80 Kev) and sensitivity (0.4 mb) of this experiment were sufficient to detect structure in the $C^{12}(\gamma, n)C^{11}$ reaction. The results of this experiment show that structure in the reaction $C^{12}(\gamma, n)C^{11}$ does not exist to the extent predicted by L. Katz and co-workers. The results are not inconsistent with broader structure reported from the $C^{12}(\gamma, p)B^{11}$ reaction, the $B^{11}(p, \gamma)C^{12}$ reaction, and the $B^{11}(p, n)C^{11}$ reaction. A reaction cross-section verses photon energy curve for the $C^{12}(\gamma, n)C^{11}$ reaction is given.

Pittsburgh U., Pa.
INELASTIC COLLISION CROSS SECTIONS FOR PROTONS AND ATOMIC HYDROGEN ON MOLECULAR HYDROGEN, by R. Curran and T. M. Donahue. Technical rept. no. 8 on Capture-Loss and Ionization Cross-Sections of Ions and Neutral Particles, Contract Nonr-624(06). Apr 59, 42p. 18 refs.
Order from LC mi$3.30, ph$7.80 PB 145 929

Measurements of the single electron capture cross section, σ_{10}, for protons of energies 2.5 to 60 Kev are reported and measurements of single electron capture and loss cross sections for atomic hydrogen, σ_{01} and σ_{01} respectively, over the same energy range. Reported for the first time are measurements of the total cross section for production of ion pairs by hydrogen atoms in molecular hydrogen.

Sarah Mellon Scaife Radiation Lab., U. of Pittsburgh, Pa.
DEUTERON-INDUCED REACTIONS IN CARBON-14, by Wesley Eugene Moore. Doctoral thesis. Technical rept. no. XI on Precision Scattering of Nuclear Particles, Contract N7onr-32505. Apr 59, 93p. 39 refs. AD-217 716.
Order from LC mi$5.40, ph$15.30 PB 145 791

A study was made of the reactions $C^{14}(d, p)C^{15}$, $C^{14}(d, d')C^{14}$, $C^{14}(d, t)C^{13}$ and $C^{14}(d, \alpha)B^{12}$ using 14.9 Mev deuterons. High resolution magnetic analysis of both the incident beam and the charged reaction particles was used. Nine proton groups were related to the C^{15} ground state and to excited states at 0.745 ± 0.020, 3.09 ± 0.03, 5.94 ± 0.03, 0.38 ± 0.03, 7.32 ± 0.03, 8.41 ± 0.05, and possibly at 4.21 ± 0.03 and 7.47 ± 0.05 Mev. Angular distributions were obtained for 4 of these states and comparison with Butler stripping theory [Proc Roy Soc (London) 208:36, 1951] was used to fix the spins and parities of the C^{15} ground state ($l_n=0$, $J=1/2+$) and first excited state ($l_n=2$, $J=5/2+$). Reduced widths obtained are $(H)^2=0.093$ and 0.032, respectively. Known C^{14} levels were studied by observing the spectrum of inelastically scattered deuterons, and a new level at 7.010 ± 0.020 Mev was discovered. Ratios of reduced widths for the C^{13} 3.09- and 3.86-Mev levels, relative to the C^{13} ground state, indicate that the C^{14} ground state wave function has 0.4 and 13.4 per cent admixtures of $s^4p^8(2s)^2$ and $s^4p^8d^2$ configuration to the s^4p^{10} configuration. The strength of the $s^4p^8d^2$ admixture suggests that the anomalously long beta-decay half-life of C^{14} may be explained without invoking a tensor force. (Author)

Radioactivity

Air Force Special Weapons Center, Kirtland AFB, N. Mex.
MAXIMUM PERMISSIBLE ACTIVITY (MPA) OF FISSION PRODUCTS IN AIR AND WATER VERSUS THE AGE OF THE PRODUCTS, by Donald L. Summers. Marvin C. Gaske, and James L. Dick. Dec 58, 14p. 7 refs. AFSWC-TN-58-30.
Order from LC mi$2.40, ph$3.30 PB 146 672

When mixed fission products are present in air and water, the maximum permissible activity (MPA) is dependent on the relative activity of the individual isotopes. This, in turn, is dependent on the age of the products. The MPA can be determined most accurately from measurements of the isotopic concentrations; however, the separation of mixed fission products into their constituent activities is extremely complicated and costly. In order to provide a simple method of evaluating the internal radiation hazard, the MPA's for ideal mixtures of fission products versus their ages were calculated and plotted. The resulting curves show that the MPA's change appreciably with time. An application of the curves can be found in AFSWC TN-58-29, Limits for Radiation Control and Release of Air Force Material Contaminated with Fission Products (Revised), soon to be published.

Lyman Lab. of Physics, Harvard U., Cambridge, Mass.
NUCLEAR SPECTRA OF THE THORIUM ACTIVE DEPOSIT, by Guy Trask Emery. Doctoral thesis. Rept. on Contract Nonr-1866(19). Apr 59, 94p. 228 refs. Technical rept. no. 1-9.
Order from LC mi$5.40, ph$15.30 PB 145 794

The relative intensities of the gamma rays of the descendants of radiothorium have been studied by measuring the photoelectron spectrum from thorium and platinum foils. Some of the previous work on the radiations from the thorium active deposit is reviewed. The level schemes of polonium 212, lead 208, thallium 208, and bismuth 212 are discussed in the light of the information found here and other recent information, and are compared with the predictions of the shell and collective models. A listing of much of the previous work on the radiations from and decay schemes of these nuclei is included.

Materials Lab., Wright Air Development Div., Wright-Patterson AFB, Ohio.
MEASUREMENT OF SCATTERED GAMMA RAYS IN FOIL ACTIVATION, by Michael P. Charles. Rept. for June 58-Nov 59 on Materials Analysis and Evaluation Techniques. Dec 59, 22p. 5 refs. WADD Technical rept. 59-4.
Order from OTS $0.75 PB 161 687

It is the purpose of this report to determine the scattered radiation component of pure gamma-ray sources used in radiation effects studies. The method to be developed involves the excitation of metastable levels in such materials as In, Cd, Ag, Lu, Hg, Pt,

Hf, Sr, and Rh by gamma-ray inelastic scattering processes. The direct excitation of the metastable states is forbidden, but these levels can be excited indirectly if the Co^{60} gamma rays have been degraded in energy-so that the remaining energy corresponds to that of a level higher than the metastable levels but which decays immediately to the metastable level. Although the cross-sections for gamma-gamma activation at these levels have not been measured, the relative activation of such foils through out the irradiation volume was found to provide considerable information on the energy distribution of scattered radiation in the WADD kilocurie gamma ray sources. Naval Research Lab., Washington, D. C.
CRITICAL ANALYSIS OF MEASUREMENTS OF THE GROSS FISSION PRODUCT ACTIVITY IN THE AIR AT GROUND LEVEL, by L. B. Lockhart, Jr. and R. L. Patterson, Jr. Interim rept. 19 Feb 60, 18p. 5 refs. NRL Rept. 5440.
Order from LC mi$2. 40, ph$3. 30 PB 144 112

A comparison of the fission product radioactivity in the air at a given site as determined by use of different techniques for collection of samples and measurement of radioactivity has shown widely divergent results to have been obtained. A study of the two widely different techniques in use at NRL has demonstrated that these discrepancies are due to the different counting and standardization techniques employed and to the inherent difficulty resulting from the changing β spectrum of fission products with age. The procedures employed for estimation of the radioactivity of samples collected in the NRL 80th-meridian program seem to be relatively insensitive to this changing β energy and to give particularly good results for the older debris. For the most accurate results the radioactivity of some one or more specific isotopes should be followed. (Author)

LITERATURE SURVEY ON THE EFFECTS OF NUCLEAR RADIATION TO ELECTRON TUBE MATERIALS, by E. R. Johnson. Quarterly rept. no. 8, 1 Mar-1 June 59, on Contract DA 36-039-sc-73146. [1959] 20p. 15 refs. AD-220 318.
Order from LC mi$2. 40, ph$3. 30 PB 145 881

Ceramic tubes when exposed to a total dose of 10^{19} nvt have a residual activity after two weeks exceeding 100 R/hr at the surface. The effect of this high residual activity in relation to tube life is discussed. The effect of nuclear radiation on subminature tubes, thin films, magnetic materials, and secondary emission is discussed. (Author) (See also PB 143 897)

SERVICE TEST OF AIRCREW ALERT BOOTS, by Norman C. Van Tassel. July 59, 9p. Technical note AAL-TN-59-14; AD-230 850.
Order from LC mi$1. 80, ph$1. 80 PB 146 235

The Dehner boot, which was developed for aircrew members operating under environmental conditions encountered within the Alaskan Air Command, was evaluated. The test item is a quick-donning boot equipped with a zipper attachment between 2 sets of laces for rapid placement and adjustability. The boot is put on and laced to fit comfortably. It is then removed by unzipping, and when it is to be donned again, it need only be slipped on and zipped up. Test results obtained from 50 individuals indicated that the boots would provide adequate thermal protection for $0^{o}F \pm 10^{o}$ depending on the degree of activity of the wearer. Results further indicated that the test boots with leather soles do not provide adequate protection on slippery surfaces, and present a safety hazard. The composition soles did provide adequate traction.

THE DETERIORATION OF INVENTORY AND EQUIPMENT, by M. Klein and L. Rosenberg. Technical rept. no. 3 (N) on Contract Nonr-266(55). 15 Apr 59, 31p. 24 refs.
Order from LC mi$3. 00, ph$6. 30 PB 145 813

This paper describes problems relative to the management of goods which deteriorate. It is traditional to divide this class of items into a "constant efficiency" and a "diminishing efficiency" group.

Naval Supply Research and Development Facility, Bayonne, N. J.
DEVELOPMENT OF SHOE, FLEET, WATER-RESISTANT, by Milton Bailey. Rept. on Service Footwear. 15 Mar 59, 18p. 13 refs. Clothing and Textile Division rept. no. 37; AD 214 707.
Order from LC mi$2. 40, ph$3. 30 PB 145 832

Decks inundated with water continually pose a hazard to health, safety and well-being of naval personnel. Conventional footgear designed primarily for use on land, fails to afford the required protection when subjected to the corrosive elements of the sea. The inadequate shoes engender ills and discomforts associated with wet feet. The continuous wetting and drying of the shoes accelerate the deterioration process, requiring large stocks and issues to support the fleet. Since specialized footwear is not available, work was undertaken to develop a water-resistant shoe that would resolve these major shipboard problems. As a result, the Shoe, Fleet, Water-Resistant was developed. The new shoe incorporated a combination of advanced components, including water-resistant leather, non-marking heels and soles, and polyethylene counters. A new construction was also incorporated that enabled shoe seams to be sealed which barred the penetration of water through the stitch holes. Characteristics were created which it was expected would enable the new shoe to replace the General Purpose Shoe, the Field Shoe, the Flight Deck Shoe and the need for wearing rubbers with work shoes, and result in one work shoe for the Fleet instead of three. THE SCATTERING CROSS SECTION OF A ROW OF CIRCULAR CYLINDERS, by Tai Tsun Wu and Harold Levine. Technical rept. no. 73 on Contract Nonr-225(11). 26 Mar 58, 42p. 7 refs. AD-162 710.
Order from LC mi$3. 30, ph$7. 80 PB 139 272

A plane wave is incident on a row of finite number of equi-spaced infinitely long cylinders of the same size. The direction of incidence is such that only one cylinder is illuminated in the sense of optics. For this geometry, the total scattering cross section is calculated in the limit where the cylinder radius is much larger than the wave length. Both the Dirichlet and the Neumann boundary conditions are treated. In electromagnetic problems, the Dirichlet (Neumann) boundary condition occurs when the electric (magnetic) vector of the incident wave is parallel to the axis of the cylinders. Some simple generalizations of this problem are stated in the final section. (Author)

Harris Transducer Corp., Woodbury, Conn.
THE THEORY OF ACOUSTIC REFLECTORS FOR SONAR APPLICATIONS. REPORT III. GENERAL THEORY OF PASSIVE ARRAYS, by H. K. Farr. Rept. on Contract Nonr-2720(00). 25 May 59, 32p. HTC-73-R3.
Order from LC mi$3. 00, ph$6. 30 PB 146 259

The purpose of this report is to present some general principles which are useful in analyzing arrays of passive acoustic elements (reflectors). The actual results for arrays of the specific type presently under study will be presented later. Consequently no "practical" results in the form of numerical information are included here. The present analysis is restricted to elements whose surfaces oscillate with some simple specified velocity pattern having an amplitude given by a known linear function of the sound pressure on the surface of the element. Examples of such elements are the end loaded cylindrical resonator (Poisson coupled cylinder) and the variable position resonator (V. P.) discussed in Reports I and II of this series. (See also PB 145 248)

Institute of Flight Structures, Columbia U., New York.
ACOUSTIC PULSE LOADING ON A TWO-DIMENSIONAL RIGID BOX IN THE VICINITY OF A FREE SURFACE, by M. B. Friedman. Technical rept. no. 22 on Contract Nonr-266(08). May 59, 8p. 3 refs. CU-1-59-ONR-266(08)-CE; AD-225 335.
Order from LC mi$1. 80, ph$1. 80 PB 146 074

The pressure loading on a box-shaped obstacle is determined in the presence of a free surface, produced by the impact of a pulse of constant strength. A period on the order of 2 transit times is considered. The normal to the incident pulse is inclined at 45^{o} with respect to the sides of the box.

Naval Research Lab., Washington, D. C.
THEORETICAL ANALYSIS OF ECHO FORMATION IN THE FLUCTUATION ENVIRONMENT OF THE SEA, by R. L. Steinberger. Interim rept. 16 Mar 60, 14p. NRL Rept. 5449.
Order from LC mi$2. 40, ph$3. 30 PB 144 476

The elements of a simplified geometric concept of the formation of underwater sound echoes are separated

and analyzed. The ever-present nonstatic behavior of the ocean is taken into consideration. The velocity potential of the echo is shown to contain two factors: one Z due to the shape of the reflector, the other A related to the instantaneous surface wave shape. The method of strip subdivision used in geometric optics is suggested for evaluation of the echo factor Z. (Author)

UNDERWATER ACOUSTIC SOURCE, by A. A. Fowle and R. W. Moore. Rept. no. 2 (Final) for 1 Dec 51-31 Aug 52 on Contract Nonr-676(00). [1952] 105p. 9 refs. Rept. no. 111-2; AD-15 021.
Order from LC mi$5.70, ph$16.80 PB 146 500

Efforts were directed toward the development of a mechanical underwater sound transducer having an omni-directional one-plane radiation pattern, a frequency of 5 to 20 kc, and a power output of 1 w for a minimum of 8 sec. Three devices were considered: a fluid-driven diaphragm, a water-hammer device, and a Hartmann generator. The first 2 were to operate on pressurized water, and the third device was to operate on pressurized air. These devices did not have the necessary power output, and they required stored energy for operation. Possible uses of the devices are discussed, and theoretical and design data are included.

ACOUSTIC RADIATION FROM ISOTROPIC TURBULENCE, by W. C. Meecham and G. W. Ford. Rept. on Project Michigan, Contract DA 36-039-sc-78801. June 59, 10p. 9 refs. Rept. no. 2900-42-T.
Order from LC mi$1.80, ph$1.80 PB 146 254

For low Mach number turbulence, Lighthill has given a result which expresses the acoustic radiation of turbulent fluid in terms of a fourth-rank velocity correlation. Through the use of the Navier-Stokes equation this relation can be put in terms of the space-time pressure correlation. For very large Reynolds number turbulence (in the inertial subrange where Kolmogoroff's similarity principles are valid) this pressure correlation can be written in terms of a function of a single variable. Since the space-time correlation of the pressure is needed, convective effects must be considered. This is done here by introducing a new Lagrangian type of correlation which is defined in such a way that a similarity argument can be applied without difficulty from the convective effects. Such convective effects then enter only through negligible Doppler shifts.

MAGNETODYNAMIC DIPOLAR FERRITE MODES, by William Henry Steier. Technical note no. 2 on Contract AF 18(603)62. 15 Jan 60, 78p. 39 refs. AFOSR-TN-60-135. AD-232 990.
Order from LC mi$4.50, ph$12.30 PB 145 732

An investigation has been made of the magnetodynamic dipolar modes of a ferrite rod between conducting sheets. Critically coupled mode Q's as high as 1100 have been measured. The advantages which these modes possess over other solved ferrite modes are pointed out.

Istituto Elettrotechnico Nazionale "Galileo Ferraris" (Italy).
EFFECT OF NEUTRON BOMBARDMENT ON THE MAGNETIC PROPERTIES OF IRON AND NICKEL OF VERY HIGH PERMEABILITY, II, by Giuseppe Biorci, Andrea Ferro, and Giorgio Montalenti. Technical note no. 2b on Contract AF 61(514)1331. Dec 59, 9p. 2 refs. AFOSR-TN-60-309.
Order from LC mi$1.80, ph$1.80 PB 146 436

Specimens have been irradiated with fast neutrons at room temperature with doses of 4×10^{17} and 1.2×10^{18} n/cm^2. After irradiation no appreciable change in the magnetic properties has been observed on nickel. On iron, on the contrary, a definite reduction of the maximum permeability and a small increase in coercive force, from 2,5 to 3 A/m has been observed.

Minnesota U., Minneapolis.
SINGLE-DOMAIN PARTICLES: NEW USES OF OLD THEOREMS, by W. F. Brown, Jr. Rept. on Contract AF 18(603)113. Feb 60, 29p. 24 refs. AFOSR-TN-60-61. AD-232 991.
Order from LC mi$2.70, ph$4.80 PB 145 858

This article describes applications of potential theory and classical dynamics to the theory of magnetization processes in "hard" magnetic materials. Many such materials owe their magnetic properties to the fact that they are composed of fine ferromagnetic particles separated by less magnetic regions. Calculation of static hysteresis loops requires consideration of stability conditions; analysis of magnetization reversals and of the behavior in microwave fields involves the dynamics of gyroscopic systems.

Electronics

Battelle Memorial Inst., Columbus, Ohio.
INVESTIGATIONS OF RARE-EARTH OXIDE CATHODES, by G. B. Gaines. Scientific rept. no. 1 on Contract AF 19(604)5691. 1 Dec 59, 12p. 9 refs. AFCRC-TN-60-108. AD-232 676.
Order from LC mi$2.40, ph$3.30 PB 145 734

The thermionic emission from two samples each of gadolinium oxide and neodymium oxide has been determined. At 1400°C, the emission from one gadolinium oxide sample was about 1 amp/cm^2. At the same temperature, both neodymium oxide samples exhibited an emission of about 0.1 amp/cm^2. The oxides were put on rhenium metal by electrophoresis. (Author)

TWO-TURN SERIES-CONNECTED LOOP ANTENNA, by J. Herman. 15 Dec 59, 56p. 6 refs. TR-762.
Order from LC mi$3.60, ph$9.30 PB 146 227

The problem of a loop antenna consisting of two equal parallel coaxial turns, series-connected, has been solved and expressed in modal form. A numerical comparison of mode impedences for a single-turn loop and a two-turn loop, each turn having the same physical dimensions as the single turn, indicates that the two-turn loop is equivalent to a single turn of larger diameter than the actual size used. The method of solution is basic and can be extended to the cases of unequal size turns, concentric turns, and multiple turns. (Author)

NONLINEAR EQUATIONS DESCRIBING BEAM TYPE CROSSED FIELD TRAVELING WAVE TUBES, by

J. W. Sedin. Technical rept. no. 6 on Contract Nonr-220(13). Oct 57, 33p. 10 refs. AD-158 004.
Order from LC mi$3.00, ph$6.30 PB 137 721

The equations governing the behavior of beam type crossed-field traveling wave tubes are formulated and presented. The geometry is assumed to be two-dimensional. The electron beam is treated as a number of cylinders of charge and space charge forces are included by calculating the field due to such a cylinder when it is placed between two perfectly conducting planes. The nonlinear equations are re-expressed in terms of normalized variables which make them suitable for machine computation. A brief discussion of the procedure for solving these equations numerically is included. (Author)

Velocities of sputtered atoms. 4. Sputtering yields in argon for Ag, Au, Cu, Ni, Pd, Fe, Mo, V, Ge, Ti, and Si in the energy range 30 to 600 ev. (See PB 138 569)

Michigan U. Research Inst., Ann Arbor.
CORRELATION BETWEEN NOISE VOLTAGES IN ANTENNA SYSTEMS, by P. G. Cath. Technical rept. no. 88 on Contract DA 36-039-sc-63203. Oct 58, 29p. 2 refs. 2262-190-T; AD-209 744.
Order from LC mi$2.70, ph$4.80 PB 146 253

To calculate the signal-to-noise ratio of the signal resulting when a number of antenna voltages are combined, it is necessary to know the degree of correlation between the individual noise components. In this report mathematical expressions are derived for the correlation between two noise voltages, induced in two antennas placed a known distance apart, assuming that the intensity of the noise arriving from each direction is known. The correlation coefficient is also derived for the nosie voltages generated in two channels of a direction finder. The results are applied, as an example, to the case of a two-element rotatable Adcock antenna. (Author)

ELECTRON BEAM WAVES IN MICROWAVE TUBES, by H. A. Haus. Rept. on Contract DA 36-039-sc-64637. 8 Apr 58, 45p. 25 refs. Technical rept. 316; AD-210 913.
Order from LC mi$3.30, ph$7.80 PB 145 783

This paper presents a review of wave propagation along electron beams and of the interaction of these waves with the fields of microwave structures. It also provides the basis for a unified theory of microwave amplifiers with distributed interaction. The small-signal power theorem for beams with zero curl of the generalized momentum is derived. This theorem and the better-known theorem for longitudinal beams are interpreted. The waves along longitudinal beams, cylindrical Brillouin beams, and Brillouin strip-beams in crossed fields are reviewed and their small-signal power flows are studied. The interaction of waves in a longitudinal-beam, traveling-wave tube is analyzed with the aid of Pierce's coupling-of-modes formalism. The small-signal power theorem is used in deciding whether or not exponential growth of a wave signifies gain. Finally, a variational principle is derived for longitudinal beams and beams with zero curl of the generalized momentum. For reasonable trial fields, the principle leads to Pierce's coupling-of-modes formalism, and can also be applied to study cases of stronger coupling than those analyzable by the coupling-of-modes theory. Equations of the magnetron amplifier are derived from the variational principle.

Research Lab. of Electronics, Mass. Inst. of Tech., Cambridge.
THEORY OF NOISY TWO-PORT NETWORKS, by E. Folke Bolinder. Rept. on Contract DA 36-039-sc-64637. 14 June 58, 30p. 50 refs. Technical rept. 344.
Order from LC mi$2.70, ph$4.80 PB 145 782

A new geometric-analytic theory of noisy two-port networks is presented. It is based, geometrically, on the isometric sphere method, a generalization of the isometric circle method to three dimensions, and, analytically, on a three-dimensional conformal transformation which was originally derived by Poincaré and Picard. The transformation is used in a study of transformations of noise ensemble average ratios through bilateral two-port networks. The study is facilitated by interpreting the transformations as non-Euclidean movements in the Poincaré and Cayley-Klein models of three-dimensional hyperbolic space. By a simple extension, noise ensemble average transformations are performed in four-dimensional spaces by means of four-vectors which are analogous to the Stokes vectors used in optics and antenna theory. The new theory has been used for studying several problems pertaining to noisy two-port networks: the Rothe and Dahlke method of splitting a noisy two-port network into noisy and noisy-free parts, cascading of noisy two-port networks, noise tuning and noise matching, the wave representation of noisy two-port networks, and the optimum noise factor. MEASUREMENT OF SMALL ABSORBANCY CHANGES IN MICROSPECTROSCOPY AND OF SMALL INTENSITIES IN MICROFLUORIMETRY, by Britton Chance. Annual rept. on Contract Nonr-551(26). [1959] 5p.
Order from LC mi$1.80, ph$1.80 PB 145 812

The purpose of this research is to investigate factors limiting the measurement of small absorbancy changes in microspectrophotometry and of small intensities in microfluorimetry. In the former case, the design, construction and test of a greatly improved form of a "Caspersson-Thorell" apparatus has been completed and its signal to noise ratio has been evaluated both from a theoretical standpoint and from the standpoint of its effectiveness in measuring enzymes in living cells. In addition to this, an alternative method for measuring enzymes themselves has been constructed and tested, namely a differential microfluorimeter of high sensitivity.

MICROWAVE SPECTRUM, INTERNAL BARRIER, STRUCTURE, CONFORMATION, AND DIPOLE MOMENT OF ACETYL FLUORIDE, by Louis Pierce (U. of Notre Dame) and Lawrence C. Krisher. Rept. on Contract Nonr-1866(14). [1959] 28p. 16 refs.
Order from LC mi$2.70, ph$4.80 PB 145 748

The microwave spectra of eight isotopic species of acetyl fluoride are reported.

Mallinckrodt Chemical Lab., Harvard U., Cambridge, Mass.
THE MICROWAVE SPECTRUM OF ACETYL CYANIDE, by Lawrence C. Krisher and E. Bright Wilson, Jr. Rept. on Contract Nonr-1866(14). [1959] 31p. 25 refs.
Order from LC mi$3.00, ph$6.30 PB 145 746

The microwave spectra of eight isotopic species of acetyl cyanide have been investigated in the region 8,000 to 34,000 mc.

Materials Research Lab., Watertown Arsenal, Mass.
HARTREE-FOCK ATOMIC SCATTERING FACTORS FOR THE IRON TRANSITION SERIES, by A. J. Freeman and R. E. Watson (Mass. Inst. of Tech.). Jan 60. 33p. 37 refs. Rept. no. 69.
Order from LC mi$3.00, ph$6.30 PB 145 727

Atomic scattering factors for thirty-five atoms and ions of the iron group transition series (Sc through Cu) have been determined from Watson's recently calculated Hartree-Fock wave functions and compared with other available calculations. Principal scattering factors were also computed, following the methods of Freeman, for the 3d electrons of those atoms containing non-spherical charge distributions.

Naval Research Lab., Washington, D. C.
AN f/3.5 MEDIUM-DISPERSION GRATING SPECTROGRAPH, by F. D. Harrington. 22 Mar 60, 18p. 4 refs. NRL Rept. 5446.
Order from OTS $0.50 PB 161 420

The Meinel spectrograph is a medium-dispersion grating instrument with an aperture of f/3.5. The average reciprocal dispersion is 20.6 A/mm and 10.3 A/mm in the first- and second-order spectra, respectively. In the first order it has a wavelength coverage from 3317 A to 8468 A and a resolution of 0.5 A. The spectrograph was built around an optical design of Dr. A. B. Meinel of the Yerkes Observatory. The collimating and camera elements utilize spherical reflecting surfaces, and the aberrations of the complete optical system are compensated by a Schmidt-type correction mirror. The mechanical features of the spectrograph were designed and built by the U.S. Naval Research Laboratory. Because of its excellent f/number, the spectrograph has found numerous applications where either light levels were low or exposures in the microsecond time region were required. (Author)

MOLECULAR FORCE FIELDS OF ETHYLENE, ALLENE FORMALDEHYDE, KETENE AND DIAZOMETHANE by Charles Edward Bailey (Doctoral thesis) and William H. Fletcher. Technical rept. no. 6 on Contract DA 33-008-ORD-1166. 20 Dec 58, 191p. 54 refs. OOR rept. 1505.8-P; AD-209 779.
Order from LC mi$8.70, ph$30.30 PB 146 799

The orbital valency force field has been applied to C_2H_4, C_3H_4, CH_2O, CH_2CO, and CH_2N_2. Vibrational potential energies were simplified by assuming negligible H—H repulsions; the results justify this assumption. The repulsive force between non-bonded C and H atoms in C_2H_4, C_3H_4, and CH_2CO, and the non-bonded O and H atoms in CH_2O agreed with the calculated repulsion based on a Lennard-Jones potential. In CH_2N_2, an electrostatic attractive force was observed between the H atoms and one of the N atoms greater than the repulsive force between the H atom and the central N atom. Agreement between calculated frequencies and observed frequencies is excellent. (Author)

ELECTRONIC SPECTRA OF SIMPLE MOLECULES, by J. B. Coon. Final rept. on Contract AF 18(600)439. 17 Dec 59, 27p. 80 refs. AFOSR-TR-59-206.
Order from LC mi$2.70, ph$4.80 PB 145 837

It is the purpose of the present program to obtain information about excited electronic states of simple molecules through a study of the ultraviolet absorption spectra of their vapors. Such experimental information is important for comparison with theoretical studies of the electronic structure of molecules which in turn lead to the prediction of the chemical and physical properties of the molecules in their various excited states.

Washington U., Seattle.
AFTERGLOW SPECTROSCOPY, by K. C. Clark. Final summary rept. for 1 Mar 56-15 Sep 58 on Contract AF 18(603)36. [1958] 8p. 13 refs. AFOSR-TR-60-4; AD-232 340.
Order from LC mi$1.80, ph$1.80 PB 145 853

Covers the following: (1) general discussion, (2) vacuum ultraviolet spectrometer, (3) echelle spectrograph, (4) diffusion gauge for active particles, (5) measurement of atom concentrations, (6) decay by three-body volume processes, (7) exponential decays, (8) diffusion rates and surface effects, and (9) quenching and stimulated emission.

X-RAY ABSORPTION COEFFICIENTS AND GEOMETRICAL COLLIMATION OF THE BEAM, by L. G. Parratt, J. O. Porteus and others. Technical rept. no. 14 on Contract AF 18(600)300. 1 Sep 58, 14p. 15 refs. AFOSR-TN-58-755; AD-201 614.
Order from LC mi$2.40, ph$3.30 PB 138 143

In recent years, in order to achieve high angular collimation of an intense x-ray beam in a measurement of an absorption coefficient, most investigators have used the action of a high-resolving-power monochromator to provide the collimation. In this case, if the absorber exhibits small-angle scattering (including multiple scattering) of significant intensity in a scattering cone as large as a few seconds of arc, the value of the coefficient depends upon the absorber-position with respect to the monochromator. A few measurements are reported with a two-crystal spectrometer to illustrate the points discussed. (Author)

INFLUENCE OF ATMOSPHERE ON OPTICAL RESOLUTION IN A TYPICAL NEVADA TUNNEL, by A. G. Rockman. Final rept. 31 Mar 60, 10p. 2 refs. NRL rept. 5459.
Order from LC mi$1.80, ph$1.80 PB 145 519

Tests were conducted to determine the optical resolution of an f/3.8 optical relay system (magnification 0.25) over a 1000-foot path in a Nevada tunnel and under a variety of atmospheric conditions. It was also necessary to measure the refractive bending of light beams under similar conditions. Theoretical (Rayleigh) resolution of a single optical element (lens or mirror) two feet in diameter working at a magnification of 0.25 with an object distance of 1000 feet would be about 14 lines/mm. The test system produced airpath resolutions of 6.4 to 9 lines/mm. The resolution apparently was not a function of direction or velocity of air flow in the tunnel system.

INVESTIGATION OF PHOTOCONDUCTORS FOR INFRA RED DETECTION, by Floyd Banks. Final rept. on Contract N7onr-415, T. O. 2. 27 June 49, 45p. 18 refs. ATI-178 303.
Order from LC mi$3.30, ph$7.80 PB 146 608

The procedures followed during the course of the investigation fall conveniently into two categories; experiments with bulk material, and experiments with thin films, both evaporated and sputtered. The materials studied in bulk form were silver chloride silver sulphide, zinc oxide, and metal-to-insulator boundaries (samples of lead sulphide and molybdenum sulphide were prepared but no serious work attempted with them). The thin films studied were tellurium.

INFRARED PHOTOCONDUCTORS. Interim rept. no. 1, 9 Jan-9 Apr 50, on Contract N6onr-23603. 1 July 50, 16p. ATI-82 772.
Order from LC mi$2.40, ph$3.30 PB 146 612

An interim report is presented on infrared photoconductors, which have longer wavelength response than those at present known. It is shown that such photoconductors are either intrinsic or impurity-activated semiconductors for which the energy gaps between the uppermost filled band and the conduction band are small. The photon energy corresponding to 12 mu radiation is approx 0.1 ev. Therefore, a necessary condition for the existence of long wavelength photoconductivity is the existence of energy levels separated by about this amount and between which electronic transitions are permitted. Long wavelength response will be exhibited only by materials cooled to low temperature. A survey is made of suitable materials and data are given also on the behavior of "secondary" photoconductors.

SOME SURFACE PROPERTIES OF INDIUM-ANTIMONIDE CRYSTALS. I. LOW-ENERGY ELECTRON-DIFFRACTION MEASUREMENTS, by H. E. Farnsworth, J. A. Dillon, Jr. and others. Final scientific rept. for 1 Sep 56-30 Sep 59 on Investigations of Surface Properties of Silicon and Other Conductors, Contract AF 19(604)1952. [1959] 21p. 9 refs. AFCRC-TR-59-197; AD-229 060.
Order from LC mi$2.70, ph$4.80 PB 145 930

Low energy electron diffraction studies have been made of five (111) and (11$\bar{1}$) surfaces of InSb which were cleaned by argon ion bombardment and annealing. From the diffraction patterns obtained in both (110) and (11$\bar{2}$) azimuths, a double-spaced structure of surface atoms appears to be present on (111) and (11$\bar{1}$) surfaces. Exposure to oxygen resulted in a gradual decrease in intensity of all beams, indicating that an amorphous layer of oxygen was formed. The sticking coefficient for oxygen on the cleaned surfaces has a maximum value of 10^{-5}, and appears to be similar on both (111) and (11$\bar{1}$) surfaces. The cleaned surface pattern could be regenerated by heating the crystal at about 330°C for approximately one hour. Studies of InSb surfaces heated in vacuum while continuously observed with a microscope showed the formation, above about 400°C, of small flattopped hillocks which migrated over the heated surface. ANALYTIC PROPERTIES OF BLOCH WAVES AND WANNIER FUNCTIONS, by W. Kohn Technical rept. no. 7 on Contract Nonr-760(13). 16 Jan 59, 41p. 6 refs.
Order from LC mi$3.30, ph$7.80 PB 145 928

The one dimensional Schroedinger equation with a periodic and symmetric potential is considered, under the assumption that the energy bands do not intersect. The Bloch waves, φ_{nk}, and energy bands, E_{nk}, are studied as functions of the complex variable, k. In the complex plane, they are branches of multivalued analytic and periodic functions, φ_k, and E_k, with branch points, k', off the real axis. A simple procedure is described for locating the branch points. Application is made to the power series and Fourier series developments of these functions. The analyticity and periodicity of φ_{nk} has some consequences for the form of the Wannier functions. In particular, it is shown that for each band there exists one and only one Wannier function which is real, symmetric or anti-symmetric under an appropriate reflection, and falling off exponentially with distance. The rate of fall off is determined by the distance of the branch points k' from the real axis. (Author)

General Atomic, San Diego, Calif.
RESEARCH IN RADIATION DAMAGE IN SEMICONDUCTORS, by J. W. Harity, H. Horiye and others. Final rept. on Contract AF 19(604)3899. 10 Feb 60, 162p. 31 refs. GA-1201; AFCRC-TR-60-117.
Order from OTS $3.00 PB 161 673

The purpose of the experimental program was to study the effect of irradiation on semiconducting materials and to apply this knowledge to fabricate a radiation-resistant diode. This program of research was carried out utilizing various facilities at General Atomic. High-energy 25-Mev electron bombardment done with the linear accelerator and neutron bombardment done with the TRIGA reactor were used to study the electrical properties of germanium and silicon as

a function of total irradiation between 78° and 300°K. The electrical properties studied were the conductivity, Hall effect, and carrier lifetime. The carrier removal rate was found to be 4.0 electrons per centimeter of 25-Mev electron path in germanium at 78°K, compared with 0.18 in silicon at 300°K. Two hole-trapping levels were found in germanium with energies above the valence band of 0.15 and 0.27 ev. Evidence of annealing was also observed between 78°K and room temperature in germanium. The result of these studies was the fabrication of a radiation-resistant diode using p-type germanium with a resistivity of about 0.20 ohm-cm as the base material.

OPTICAL PROPERTIES OF PARAMAGNETIC SOLIDS, by W. Low. Technical note no. 10 on Contract AF 61(052)59. Aug 59, 29p. 36 refs. AFOSR-TN-60-168.
Order from LC mi$2.70, ph$4.80 PB 145 862

The transition groups show absorption and fluorescence spectra characteristic of the particular ion and of the crystal surroundings. Certain regularities are shown to exist in the intensities of the absorption lines and line width of these transition groups.

Institute of Tech., U. of Minnesota, Minneapolis.
STUDY OF NOISE IN SEMICONDUCTORS AND SEMICONDUCTOR DEVICES, by A. van der Ziel. Quarterly rept. no. 3, 1 Dec 58-1 Mar 59, on Contract DA 36-039-sc-78009. [1959] 71p. 6 refs.
Order from LC mi$4.50, ph$12.30 PB 146 028

There have been reports of discrepancies between theory and measurements of noise in silicon transistors. A program of measurement of noise in silicon transistors has been undertaken. Preliminary results of this program are presented in this report. These results indicate that discrepancies do exist; there is a frequency dependent divergence from the theoretical value at very low injection levels; there is a marked increase in noise at high injection levels. An experimental expression for the noise in the mid-current region is presented which fits the experimental curve better than the present theoretical expression. A revised method of measurement is presented. This method of measurement is to be used for the measurements of noise in transistors and should permit a significant increase in the speed and accuracy of collecting data. A theory is presented which demonstrates the correspondences between carrier diffusion and signal propagation on a transmission line. The analogy is used to solve for the spectral density of the fluctuations in the total number of carriers in a one-dimensional semiconductor with surface recombination. It is found that this approach clarifies several points of confusion found in previous treatments. (Author) (See also PB 142 765)

SOLID-STATE LOGICAL TRANSDUCERS, by F. E. Battocletti, E. C. Orris and others. Rept. on Research on Physical Phenomena Affecting the Characteristics of Electronic Components, Contract AF 33(616)5923. Feb 60, 39p. 12 refs. WADC Technical rept. 59-686.
Order from OTS $1.00 PB 161 668

Theoretical and experimental investigations of methods of performing complex logical operations with semiconductor devices are described. It is shown that every n-ary connective may be constructed from, at most, two (n-1)-ary connectives and a single-pole double-throw switch. The effects considered for use, either singly or in combination, in fabricating logic circuits include the field effect, punch through, four-layer switch, avalanche breakdown, and the tunnel effect. Experimental techniques that were used in making diffused junctions, oxide masks, and thermal compression bonds are discussed. Only very preliminary results were obtained in experiments on functioning devices. (Author)

HIGH NEGATIVE NUCLEAR POLARIZATIONS IN SOLUTIONS OF FREE RADICALS, by L. H. Bennett and H. C. Torrey. Doctor's thesis. Rept. on Contract AF 18(603)6. 26 Jan 60, 22p. 24 refs. AFOSR-TN-60-107. AD-232 622.
Order from LC mi$2.70, ph$4.80 PB 145 839

A double magnetic resonance experiment in which negative proton spin polarizations were obtained in liquids containing dissolved paramagnetic material is described in this paper. The present paper, which is an extension of our earlier work, reports negative proton polarizations of up to about 150 in both naphthalene and anthracene free radical solutions.

Uppsala U. (Sweden).
BORIDES OF RHENIUM AND THE PLATINUM METALS. THE CRYSTAL STRUCTURE OF Re_7B_3,

ReB, Rh_7B_3, $RhB_{\sim 1.1}$, $IrB_{\sim 1.1}$, AND PtB, by B. Aronsson, E. Stenberg and J. Aselius. Technical note no. 8 on Contract AF 61(052)40. 15 Dec 59, 20p. 14 refs. AFOSR-TN-59-1138.
Order from LC mi$2.40, ph$3.30 PB 145 866

Re_7B_3 and Rh_7B_3 are isomorphous with Ru_7B_3 (Th_7Fe_3 ($D10_2$)-type). The structure of ReB is closely related to those of Mo_2B_5 and W_2B_5. $RhB_{\sim 1.1}$ and PtB crystallize in the anti-NiAs structure, and a phase with the approximate composition $IrB_{\sim 1.1}$ is isomorphous with $ThSi_2$ (C_c-type).

Uppsala U. (Sweden).
THE CRYSTAL STRUCTURE OF Re_3B, by B. Aronsson, Maggie Bäckman and S. Rundqvist. Technical note no. 11 on Contract AF 61(052)40. 22 Jan 60, 10p. 9 refs. AFOSR-TN-59-1290.
Order from LC mi$1.80, ph$1.80 PB 145 859

The crystal structure of Re_3B has been determined by powder and single crystal methods.

Uppsala U. (Sweden).
X-RAY INVESTIGATION ON RHODIUM PHOSPHIDES. THE CRYSTAL STRUCTURE OF Rh_4P_3, by Stig Rundqvist and Allan Hede. Technical note no. 10 on Contract AF 61(052)40. 9 Jan 60, 18p. 20 refs. AFOSR-TN-59-1270.
Order from LC mi$2.40, ph$3.30 PB 145 860

The rhodium-phosphorus system has been investigated in the range 0-75 atom per cent phosphorus using X-ray and chemical analytical methods. Four intermediate phases have been found, viz. Rh_2P, Rh_4P_3, RhP_2 and RhP_3.

Willow Run Labs., U. of Michigan, Ann Arbor.
PHASE DIAGRAM FOR THE BINARY SYSTEM CdTe-In_2Te_3, by Lars Thomassen and Donald R. Mason. Rept. on Project Michigan, Contract DA 36-039-sc-78801. Apr 60, 27p. 16 refs. 2900-80-R.
Order from LC mi$2.70, ph$4.80 PB 146 869

The phase diagram for the binary system CdTe-In_2Te_3 has been obtained by correlating information from differential thermal analysis measurements, microscopic studies, diffusion couples, and X-ray powder patterns. In establishing the terminal points for this diagram, the melting point for In_2Te_3 was found to be 667 ± 1°C. For CdTe, a melting point of 1098 ± 3°C was indicated. In going across the diagram, three peritectics are apparent. The first (β) is at 785°C and 50 mol % In_2Te_3; the second (γ) is at about 702°C and 74 mol % In_2Te_3; and the third (δ') is at 695°C and about 83 mol % In_2Te_3. There is a large retrograde solubility of $CdIn_2Te_4$ in CdTe. The δ-phase transforms to an ϵ-phase at 625°C and 100% In_2Te_3. The addition of CdTe stabilizes the δ-phase, and it finally disappears to $\gamma + \epsilon$ in a eutectoid reaction at about 360°C and 83 mol % In_2Te_3. Some of the properties of the phases have been measured and are presented. There appear to be qualitatively significant monotonic relationships among the energy gap, the transition temperatures, and the compositions. (Author)

THEORETICAL STUDY OF HIGH TEMPERATURE EMISSIVITIES AND ATMOSPHERIC TRANSMISSION, by Gilbert N. Plass and V. Robert Stull. Final rept. on Contract AF 19(604)2166. 30 Jan 60, 88p. 17 refs. Aeronutronic U-784; AFCRC-TR-60-221.
Order from LC mi$4.80, ph$13.80 PB 145 869

A number of different topics have been investigated which are connected with the determination of the high temperature spectral emissivity of molecules and solid particles and with the transmission of infrared radiation through the atmosphere. Basic to all of these calculations was the development of new mathematical models to represent the absorption of an infrared band. These models materially reduce the amount of computation involved without sacrificing accuracy. They were used to calculate the spectral emissivity of carbon dioxide from 1800 to 2500 cm^{-1} and of hydrogen chloride from 1000 to 3400 cm^{-1}. The spectral emissivity of spherical carbon particles was also calculated up to 2400°K. New and more accurate calculations have been made of the atmospheric absorption of infrared radiation in the region of most of the important bands. (Author)

Applied Mathematics and Statistics Lab., Stanford U., Calif.
A CORNER EFFECT IN PLANE DIFFUSION THEORY, by Harold Levine. Technical rept. no. 83 on Contract Nonr-225 (11). 6 May 59, 34p. 5 refs. AD-216 413.
Order from LC mi$3.00, ph$6.30 PB 146 075

Some aspects of the mathematical technique are discussed with reference to plane problems where the boundaries are defined by straight lines. A different approach to the problem is considered which does not require series development and subsequent summation and is distinguished by a greater adaptability to the study of various aspects of the solution. The method rests on a pair of integral transform relations. A discussion is given of the local flux, or normal derivative, at the boundary with reference to the right angle corner. Its deviation from a constant value, reached at large distances from the corner, is characterized by an inhomogeneous integral equation with semi-infinite domain. The complex Fourier transform of this distribution satisfies a simple type of functional or difference relation, and is obtained by a further application of the same transformation. The normal derivative at the boundary is recalculated to illustrate a technique for employing an integral representation of the spatial function within the corner region.

Astro-Electronic Products Div., Radio Corp. of America, Princeton, N. J.
RESEARCH ON PLASMA ACCELERATION BY ELECTRIC FIELD GRADIENT. Semi-annual technical rept. for 30 June-31 Dec 59 on Contract AF 49(638)658. Dec 59, 74p. 26 refs. [AFOSR-TN-60-211; AD-232 096]
Order from LC mi$4.50, ph$12.30 PB 145 873

Theoretical and experimental studies of plasma acceleration by nonuniform RF fields are presented. Theoretical considerations indicate that a plasma will be accelerated toward the low-field region if the applied frequency is greater than the plasma frequency and toward the high-field region if the frequency is less than the plasma frequency. Pulses of mercury plasma have been generated in a reproducible way, and an RF system has been designed and operated. Phototubes and electron and ion pickup probes have been used for detecting the moving plasma. Oscillograms show a change in plasma velocity as the RF field is applied. (Author)

ON THE FLOW OF A VISCOUS ELECTRICALLY CONDUCTING FLUID, by Harvey P. Greenspan. Rept on Contract AF 49(638)61. Oct 59, 34p. 3 refs. Research rept. 73; AFOSR-TN-59-1221; AD-231 877.
Order from LC mi$3.00, ph$6.30 PB 145 772

Magnetohydrodynamic flow of a viscous incompressible fluid of constant properties past a flat plate is considered. The applied magnetic field is parallel to the free stream direction and the plate is at zero angle of attack. A number of explicit solutions of the linearized theory are presented for the flow past a semi-infinite plate which is either sucking or injecting a conducting fluid into the main stream. The sub-Alfven flow past a long finite impermeable plate is studied in some detail and the magnitude of the viscous wake is compared to the similar type upstream disturbance produced by the forward propagation of Alfven waves.

Brandeis U., Waltham, Mass.
ON A QUANTUM MECHANICAL THEORY OF ABSOLUTE REACTION RATES, by Sidney Golden. Technical rept. no. 6 on Contract Nonr-1677(01). 1 Apr 59, 57p. 22 refs.
Order from LC mi$3.60, ph$9.30 PB 145 810

The criteria employed for classifying a collection of electrons and nuclei as some particular set of chemical species or another are embodied in the form of projection operators, here termed species-classification operators. Logical properties or reproducibility, distinguishability and completeness are imposed upon the several species-classification operators for a system. The effect of different criteria of species classification upon the kinetic equations is discussed in relation to current theories of absolute reaction rates. (See also PB 140 966)

Cornell U., Ithaca, N. Y.
DIFFUSION AND DESORPTION OF METAL IMPURITIES IN PLATINUM, by Richard C. Bradley. Technical rept. no. 13 on Contract AF 18(600)674. 1 Oct 59, 18p. 18 refs. AFOSR-TN-59-1004.
Order from LC mi$2.40, ph$3.30 PB 145 868

Activation energies for the volume diffusion of impurities in polycrystalline platinum samples have been obtained by studying the ions released at temperatures above 1000°C.

Electron Tube and Microwave Lab., Calif. Inst. of Tech., Pasadena.
EXPERIMENTS ON THE INTERACTION OF A MODULATED ELECTRON BEAM WITH A PLASMA, by Gary D. Boyd. Technical rept. no. 11 on Contract Nonr-220(13). May 59, 111p. 55 refs.
Order from LC mi$6.00, ph$18.30 PB 145 902

New experiments are performed concerning the high frequency interactions of electron beams and plasmas. In the course of verifying plasma density measurements, the excitation of the dipole resonance of a plasma column is considered. Multiple resonances are observed and discussed.

Plasma Propulsion Lab., Republic Aviation Corp., Farmingdale, N. Y.
EXPERIMENTAL INVESTIGATIONS OF ELECTROMAGNETICALLY INDUCED DETONATIONS. PART I. PARAMETERS AFFECTING THE FORMATION OF THE PINCH, by Thomas Donner and Leonard Aronowitz. Rept. on Contract AF 49(638)552. Nov 59, 35p. 4 refs. PPL rept. no. 122. AFOSR-TN-60-59.
Order from LC mi$3.00, ph$6.30 PB 145 843

A series of tests were conducted with various gases to investigate the conditions needed for the formation of the "pinch discharge". Most tests were conducted at capacitor energies somewhat below those under which pinches had been previously obtained. Some tests were made with mixtures of H_2 and O_2 as a first attempt to obtain pinch induced detonations.

Plasma Propulsion Lab., Republic Aviation Corp., Farmingdale, N. Y.
THEORETICAL STUDIES FOR A PROBLEM IN ELECTROMAGNETICALLY INDUCED DETONATIONS, by W. Chinitz, K. M. Foreman, and L. W. Levin. Rept. on Contract AF 49(638)552. 30 Nov 59, 87p. 15 refs. PPL rept. no. 121; AFOSR-TN-60-85.
Order from LC mi$4.80, ph$13.80 PB 145 842

The aerothermochemistry of electromagnetically driven gaseous detonations is formulated. Next, the revisions necessary to transpose to a moving forced detonation, supported by a magnetic piston, are detailed. The numerical approximation techniques to permit programming for automatic digital computers are discussed. A method of computing enthalpy, heat of formation and equilibrium constant from available data is outlined. Quantities are tabulated for 16 reactions, involving hydrogen, oxygen, nitrogen, and argon, between temperatures of 100° to 24,000°K. The results of a parametric study of standing oxy-hydrogen and air-hydrogen detonations are graphically presented and discussed.

Stevens Inst. of Tech., Hoboken, N. J.
INVESTIGATION ON THE MANY BODY PROBLEM, by Jerome K. Percus. Final rept. on Contract Nonr-263(11). [1959] 14p.
Order from LC mi$2.40, ph$3.30 PB 145 996

Summaries are presented of: "dynamical" Lagrangian; statistical approach to the domain of action of collective co-ordinates; analysis of classical statistical mechanics by means of collective coordinates; role of quantum statistics in the collective approach; collective coordinate analysis of free Einstein-Bose system; the ground state of an Einstein-Bose system; comments on Bohm's new theory of superfluid helium II; some remarks on the role of supplementary variables in the collective treatment of the many body problem; generalized collective coordinates; some new kinds of collective coordinates; normal modes of oscillation at low density; collective modes of oscillation at high density; transverse collective coordinates; generation of action-angle variables; interpolation method; the equation of state for classical statistics; and the semiclassical approach.

WIND EXCITED RIGID-BODY VIBRATIONS OF THE HELIOSTAT MIRROR FOR THE PROPOSED DEPARTMENT OF DEFENSE SOLAR FURNACE, by Sigurd Hoyer (Potter Instrument Co.). Jan 60, 54p. 5 refs. AFMDC-TN-60-1.
Order from LC mi$3.60, ph$9.30 PB 145 738

Rigid-body vibrations of the heliostat mirror is the subject of the present report. A minimum requirement is that the mirror be designed to withstand the static load produced by the worst possible wind condition. It is pointed out that the mirror may fail, even if this requirement is satisfied. Such failure may occur if the mirror is excited at one of its natural frequencies, or if the mirror is dynamically unstable in any possible wind condition. Von Kármán vortices may conceivably excite the mirror at one of its natural frequencies. Calculations presented here indicate that this should not prove to be a dangerous source of excitation. It is shown that one must investigate the dynamic stability of the mirror considered as a rigid body. Furthermore, it is shown that in order to do this, one must consider at least three coupled modes of vibration simultaneously.

Avco-[Everett] Research Lab., Mass.
HYPERSONIC GAS DYNAMIC CHARTS FOR EQUILIBRIUM AIR, by Saul Feldman. Rept. on Contract AF 04(645)18. Jan 57, 137p. 6 refs. Research rept. 40
Order from LC mi$6.90, ph$21.30 PB 146 700

A collection of charts is presented for the equilibrium properties of air in several flow situations of interest in hypersonic flow. The cases considered are: (a) flow over bodies in flight at hypersonic speeds: normal and oblique shocks; (b) flow over bodies in shock tubes: this includes moving, standing and reflected normal shocks as well as oblique shocks. A Mollier diagram is also included. (Author)

Avco [Everett] Research Lab., [Mass.]
RELAXATION PHENOMENA IN AIR BETWEEN 3000 AND 8000°K, by M. Camac, J. Keck, and C. Petty. Rept. on Contract AF 04(645)18. 13 Mar 58, 32p. 9 refs. Research rept. 22.
Order from LC mi$3.00, ph$6.30 PB 146 853

Experimental data on the time dependence of the molecular oxygen concentration and the emitted radiation behind moving shock waves in air have been obtained which may be applied directly to practical aerodynamic problems or interpreted to give basic information about reaction kinetics. Since the reaction kinetics of air are not at all well understood at present and are probably quite complicated, extreme caution is urged in extrapolating the information given to conditions which differ markedly from those of the experiments.

General Electric Co. [Schenectady, N. Y.]
TEMPERATURE-ALTITUDE TEST OF MODEL II FIN SERVO AMPLIFIER WITH DOUBLE LAMINATE MOUNTING BOARD, by E. C. Fehner. 16 Oct 52, declassified, 4p. Hermes Heat Transfer memo. no. 55.
Order from LC mi$1.80, ph$1.80 PB 145 916

General Mills, Inc., Minneapolis, Minn.
RESEARCH ON THE EFFECTS OF COLLISIONS OF SMALL PARTICLES WITH BODIES MOVING AT HYPERSONIC SPEED. PART II. EROSION AND HEAT TRANSFER EFFECTS, by G. Whitnah, G. Wehner and others. Rept. for 15 Sep 58-15 July 59 on Contract AF 33(616)5565. Aug 59, 110p. 4 refs. WADC Technical rept. 58-498, Pt. 2.
Order from OTS $2.50 PB 161 657

Results of experimental work in the investigation of heat transfer to smooth and roughened nose cone models are discussed. Heat transfer coefficients for models roughened by sandblasting and by etching are compared with those of smooth models for the two stagnation pressures investigated. Large increases in average heat transfer coefficients were found for the roughened models. Locations of maximum heat transfer were measured for both roughened and smooth models and were found to be considerably closer to the stagnation point for the roughened models than for the smooth model. The experimental apparatus and techniques employed in these investigations are described. Surface pitting or roughening due to the formation of binary and ternary alloys at elevated temperatures has been studied further. Recent data on hypervelocity cratering are discussed. A mathematical analysis of the dispersion of particles by explosive means and as a result of wind shear forces has been made.

Guggenheim Aeronautical Lab., Calif. Inst. of Tech., Pasadena.
IMPACT PRESSURE AND TOTAL TEMPERATURE INTERPRETATION AT HYPERSONIC MACH NUMBER, by J. C. Graves and N. R. Quiel. Rept. on Hypersonic Research Project, Contract DA 04-495-ORD-19. 26 July 54, 66p. 18 refs. Memo. no. 20.
Order from LC mi$3.90, ph$10.80 PB 146 701

Results are presented of an experimental investigation of impact-pressure and total-temperature interpretation at a nominal Mach number of 5.6. The data indicate that the Rayleigh equation, which assumes non-viscous flow, requires correction at low free-stream Reynolds numbers. These viscous effects are detected at Reynolds numbers (based on impact-probe diameter) as high as 6000, and they continue to increase with decreasing Reynolds numbers. At the low pressure limit of the facilities used in this investigation, the maximum viscous correction is 2.5 per cent for a Reynolds number of 425.

Institute of Engineering Research, U. of California, Berkeley.
HEAT TRANSFER, RECOVERY FACTOR AND PRESSURE DISTRIBUTIONS AROUND A CIRCULAR CYLINDER NORMAL TO A SUPERSONIC RAREFIED AIR STREAM. PART II: COMPARISON OF EXPERIMENT WITH THEORY, by Omar El-Khattab Tewfik. Doctoral thesis. Rept. on Contract Nonr-222(45). 15 May 59, 75p. 18 refs. HE-150-169; Series no. 20, issue no. 128; AD-217 961.
Order from LC mi$4.50, ph$12.30 PB 146 027

Theoretical methods for the prediction of heat transfer, recovery factor and pressure distributions around a circular cylinder normal to a supersonic rarefied gas stream are critically evaluated by comparison with experimental measurements. The results of extensive measurements of heat transfer, recovery factor and pressure distributions obtained in the low pressure wind tunnel of the University of California are reported. Interpretation of these results involved essentially the analysis of heat transfer from a laminar compressible boundary layer with pressure gradient and provides an excellent criterion for a critical study and evaluation of pertinent theory. The modified Newtonian theory was compared with the results of pressure distribution measurements in the Mach number range 3.55 - 5.73, and the Reynolds number range 330 - 4100, using an adiabatic and a cooled model. The free stream was rarefied, with its density corresponding to that of the atmosphere at about a 30-40 mile altitude. (Author) (See also PB 145 090)

Jet Propulsion Lab., Calif. Inst. of Tech., Pasadena.
A METHOD OF DETERMINING THE THERMAL CONDUCTIVITY, ELECTRICAL RESISTIVITY, AND TOTAL AND SPECTRAL EMISSIVITY OF A CONDUCTING MATERIAL AT HIGH TEMPERATURE FROM ELECTRICAL AND THERMO-OPTICAL MEASUREMENTS ON A HEATED TUBE IN A VACUUM, by Walter B. Powell. Rept. on Contract DA 04-495-ORD-18. 5 July 57, 21p. 1 ref. Progress rept. no. 20-324; AD-151 861.
Order from LC mi$2.70, ph$4.80 PB 146 369

A method of determining the thermal conductivity and electrical resistivity of a conducting material, as functions of temperature, from electrical and thermal measurements on a heated tube is described. This method takes into account linear gradients of these physical properties with temperature. A separate calculation procedure, to be employed when an optical pyrometer is used to observe the tube surfaces, makes it possible to determine the total and spectral emissivity, as well as the true temperature. (Author)

Leyden U. (Netherlands).
ENTROPY AND GAUSSIAN-MARKOFF PROCESSES, by P. Mazur and S. R. de Groot. Technical note on Contract AF 61(052)16. 16 July 59, 17p. 1 ref. AFOSR-TN-59-960; AD-226 408.
Order from LC mi$2.40, ph$3.30 PB 146 020

The model of Gaussian-Markoff processes is used to discuss the time behavior of entropy. The statistical definitions of entropy of Boltzmann and Gibbs are considered. Under macroscopic conditions, the same behavior as expected from non-equilibrium thermodynamics is shown to be obtained in both cases. (Author)

Naval Research Lab., U. of Wisconsin, Madison.
THE INITIAL PRESSURE DEPENDENCE OF THERMAL CONDUCTIVITY AND VISCOSITY, by Daniel E. Stogryn and Joseph O. Hirschfelder. Rept. on Contract N7onr-285(11). 13 Apr 59, 35p. 21 refs. WIS-ONR-36.
Order from LC mi$3.00, ph$6.30 PB 145 889

The initial pressure dependence of thermal conductivity and viscosity of gases is considered to arise from (1) molecular association and (2) collisional transfer. Clusters larger than dimers can be neglected. In the case of thermal conductivity, it is found that at low temperatures molecular association is more important than collisional transfer while at high temperatures collisional transfer predominates. For viscosity, the initial pressure dependence is due primarily to collisional transfer. Detailed equations are given for both of these effects.

Purdue U. Div. of Engineering Sciences, Lafayette, Ind.
IRREVERSIBLE THERMODYNAMICS AND CONTINUUM MECHANICS, by A. Cemal Eringen. Technical rept. no. 14 on Contract Nonr-1100(02). May 59, 33p. 17 refs.
Order from LC mi$3.00, ph$6.30 PB 145 900

Principles of the irreversible thermodynamics are recapitulated. Using the basic conservation principles and the principles of irreversible thermodynamics, the fundamental equations and constitutive relations are obtained for fluids, solids, and visco-elastic media. Equations for the entropy production and heat conduction are derived for various special media and for a general medium having internal constraints. For the latter case, a law generalizing Fourier's law of heat conduction is found. (Author)

Wave Propagation

Georgia Inst. of Tech. Engineering Experiment Station, Atlanta.
STUDIES OF METEOR-BURST PROPAGATION AT 49 AND 74 MEGACYCLES, by M. L. Meeks,

J. C. James and others. Final rept. for 1 Jan 56-30 June 58 on Contract AF 19(604)1593. [1958] 70p. 11 refs. AFCRC-TR-58-178; AD-160 821.
Order from LC mi$3.90, ph$10.80 PB 137 438

Signals transmitted from Walpole, Massachusetts, on 49.44 mc and 73.82 mc were received at Congaree, South Carolina, (path length 1250 km) and at Smyrna, Georgia, (path length 1480 km). Five-element Yagi antennas were used, and the output power was 5 kw on 49 mc and 3 kw on 74 mc. The duty cycle was found to be 2 or 3 times greater at 49 mc during the night, but during the day - particularly around noon - the duty cycle became about equal because of ionospheric-scatter noise at 49 mc. Diurnal variations in meteor burst rates on both frequencies show good agreement with the theoretical predictions of James and Meeks. Over flat terrain at Congaree there was no significant change in meteor-burst rate with antenna height for heights ranging from 1.65 λ to 6.34 λ. However, strong decorrelations were found between the burst amplitudes observed at markedly different antenna heights. Strong correlation was observed between underdense bursts observed with two antennas at the same height above ground but with various lateral separations extending out to 662 ft at Congaree. Overdense bursts, however, frequently showed decorrelations. Close agreement was found between the burst rates observed simultaneously at Congaree (flat terrain) and at Smyrna (hilly terrain). In the terrain at Smyrna bursts from two antenna at the same height above sea level were well correlated. (Author)

National Bureau of Standards, Boulder, Colo.
REPORT ON THE IGY OBLIQUE-INCIDENCE SPORADIC-E AND F-SCATTER PROGRAM, by J. W. Finney and E. K. Smith, Jr. Final rept. on National Science Foundation Grant no. Y/6.14/120 and Technical rept. no. 1 on NSF Grant no. Y/22.7/328. Mar 60, 101p. 4 refs. Technical note no. 48.
Order from OTS $2.50 PB 151 407

The existence of the longitude effect in the occurrence of sporadic-E propagation suggested by previous data has been affirmed by this experiment, inasmuch as three to five times more sporadic E (depending on the reference level) has been observed on the Poro-to-Onna circuit in the Far East than on the Panama-to-Cuba circuit in the Caribbean. Seasonal variations of the occurrence of sporadic E showed the summer maximum on both circuits, but only the Far East one had a well defined winter peak. Diurnally, sporadic E recorded over the Poro-to-Onna circuit exhibited a double-peaked daytime maximum, with the peaks occurring at 1000 and 1700 hours. The Es data from the Panama-to-Cuba circuit also had the daytime maximum but only one peak in the afternoon. Peculiar evening signal enhancements (referred to as the evening signal anomaly or Far East anomaly) have been observed, particularly around the fall equinox, over the Poro-to-Onna circuit.

National Bureau of Standards, Boulder, Colo.
A SUMMARY OF VHF AND UHF TROPOSPHERIC TRANSMISSION LOSS DATA AND THEIR LONG-TERM VARIABILITY, by D. A. Williamson, V. L. Fuller and others. Mar 60, 183p. 2 refs. Technical note no. 43.
Order from OTS $2.25 PB 151 402

Cumulative distributions of hourly median basic transmission loss are presented for 135 beyond-line-of-sight radio paths in the United States. In order to allow for seasonal trends of transmission loss, the year is divided into a summer period, May through October, and a winter period, November through April. The long-term variability of observed hourly medians is compared with predicted variability based on empirical curves by Rice, Longley and Norton. (PB 151 374). (Author)

A NUCLEAR MAGNETIC RESONANCE SPECTROMETER, by Perry R. Longaker. Master's thesis. Technical rept. no. 1 on Contract Nonr-1141(07). May 59, 54p. 11 refs. AD-229 366.
Order from LC mi$3.60, ph$9.30 PB 145 931

The construction of a Pound type nuclear magnetic resonance absorption spectrometer patterned after the Nuclear Magnetics Corporation design is described. Calibration and operation procedures at radio frequency fields of 1 to 30 mc and magnetic fields of about 7500 gauss are discussed, utilizing proton resonance in mineral oil and the lithium resonance in various compounds. (Author)

Ohio State U. Research Foundation, Columbus.
THE EFFECT OF AUDITORY STIMULATION ON THE PRONUNCIATION OF ENGLISH WORDS BY NON-NATIVE SPEAKERS, by Henry M. Moser, Herbert J. Oyer and others. Technical rept. no. 54 on Contract AF 19(604)4575. Sep 59, 21p. 12 refs. AFCRC-TN-59-56.
Order from LC mi$2.70, ph$4.80 PB 146 218

On the basis of experimental evidence presented, it is concluded that: (1) Auditory stimulation improves the intelligibility of the pronunciation of English words by foreign nationals. (2) The most frequent distortions that occurred for the vocabulary under study involved vowel distortions. (3) Auditory stimulation may have an adverse effect upon some words. However, there was no set pattern of distortion in terms of vowel, consonant, or inflectional distortion. Adverse effect is probably due to chance.

Willow Run Labs., U. of Michigan, Ann Arbor.
SURVEY OF AUTOMATA THEORY, by John Holland. Memo. on Proj. Michigan, Contract DA 36-039-sc-78801. Sep 59, 25p. 26 refs. Memo. no. 2900-52-R; AD-226 595.
Order from LC mi$2.70, ph$4.80 PB 145 992

Automata theory draws its methods and data from several disciplines. Major contributions of 4 disciplines, and the way in which these contributions are integrated to form a unified discipline, are surveyed here. The 4 disciplines are : (1) logic and metamathematics, (2) the theory and use of stored-program computing machines, (3) information theory, and (4) neurophysiology and related parts of psychology. From logic and metamathematics come the concepts of a formal system (the axiomatic method and decision procedures), general recursive functions (effective definition), and Turing machines (computability). Study of stored-program computers contributes the concepts of the logical net, programming, and simulation. Information theory provides a means of studying complex systems by statistical methods, giving a measure of the amount of data a system can process or store, and rigorous definitions to concepts such as redundancy and feedback. Finally, neurophysiology and psychology supply data and examples of very complex systems, important questions, and some suggestive outlines of theory. Consideration is given to the way in which these methods and concepts are coordinated to provide abstract deductive theories of complex systems with delayed feedback. (Author)

Stanford U., Calif.
LOANABLE FUNDS VERSUS LIQUIDITY PREFERENCE THEORIES OF INTEREST, by Takashi Negishi. Technical rept. no. 74 on Contract N6onr-25133. 30 Apr 59, 13p. 11 refs.
Order from LC mi$2.40, ph$3.30 PB 145 945

If we introduce money and credit in the general economic equilibrium model, we must decide between two alternative theories of the rate of interest, the Loanable Funds Theory, and the Liquidity Preference Theory. Here we confine ourselves to the merits and demerits of these two theories in relation to the tâtonnement the dynamic adjustment within a Hicksian week, and understand that the Loanable Funds Theory insists that the dynamic movement of the rate of interest is determined by the excess demand which exists in the loan market, while the Liquidity Preference Theory maintains the determination of the dynamic path of the rate of interest by the excess demand which exists in the money market.

THESAURUS OF ASTIA DESCRIPTORS, FIRST EDITION, by J. Heston Heald, Herbert Rehbock and others. 329p. AD-235 000.
Order from OTS $5.00 PB 161 681

All bibliographic searches performed by ASTIA will be translated into the 7000 word vocabulary of descriptors which constitutes our authoritative terminology for machine retrieval. This Thesaurus is a multiple-access device to that vocabulary. Entry may be made by (1) broad subject field concepts which will guide the user to specific terminology within that field or (2) specific terminology which is cross-referenced to terms with broader implications within the same or related fields. In making subject matter inquiries or bibliography requests from ASTIA, descriptors or combinations of descriptors chosen from this Thesaurus will be helpful in retrieving the pertinent information.

Order from LC mi$2.40, ph$3.30 PB 146 070

Patent Office, Washington, D. C.
ORGANIZATION OF CHEMICAL DISCLOSURES FOR MECHANIZED RETRIEVAL, by B. E. Lanham, J. Liebowitz and others. 14 June 57, 12p. 2 refs. Research and Development repts. no. 5.
Order from LC mi$2.40, ph$3.30 PB 146 069

Patent Office, Washington, D. C.
A PUNCHED CARD SYSTEM FOR SEARCHING STEROID COMPOUNDS, by Julius Frome and Jacob Leibowitz. 8 July 57, 12p. Research and Development repts. no. 7.
Order from LC mi$2.40, ph$3.30 PB 146 071

Patent Office, Washington, D. C.
RECENT ADVANCES IN PATENT OFFICE SEARCHING: STEROID COMPOUNDS AND ILAS, by Julius Frome, H. R. Koller and others. Rept. of presentation made at Western Reserve University Symposium for Systems on Information Retrieval held in Cleveland, Ohio, April 15-17, 1957. 14p. 1 ref. Research and Development repts. no. 8.
Order from LC mi$2.40, ph$3.30 PB 146 072

Patent Office, Washington, D. C.
STORAGE AND RETRIEVAL OF CONTENTS OF TECHNICAL LITERATURE; NONCHEMICAL INFORMATION, by Don D. Andrews and Simon M. Newman. 15 May 56, 13p. 4 refs. Research and Development repts. no. 1.
Order from LC mi$2.40, ph$3.30 PB 146 066

Patent Office, Washington, D. C.
STORAGE AND RETRIEVAL OF CONTENTS OF TECHNICAL LITERATURE; NONCHEMICAL INFORMATION, by Simon M. Newman. June 57, 15p. 5 refs. Research and Development repts no. 4.
Order from LCmi$2.40, ph$3.30 PB 146 068

MISCELLANEOUS

Naval Research Lab., Washington, D. C.
REPORT OF NRL PROGRESS, May 60.
Order from OTS $1.25, $10.00/year PB 161 281

Contents:
Articles: 220-
220-Mc propagation in an elevated duct (project trade winds). Wave propagation branch staff
Magnetic compression of plasmas, by A. C. Kolb
An X-ray shield for a 2-Mv Van de Graaf accelerator, L. S. August
Scientific program:
Problems accepted
Problem notes
Applications Research: Formula for computing probability of success in war games and other competitive situations
Astronomy and Astrophysics: New extreme ultraviolet solar spectra
Chemistry: Stabilization of silicone lubricating liquids above 200°C, pt. 1, conventional oxidation inhibitors and some high-surface solids. Present status of chemical research in atmosphere purification and control on nuclear-powered submarines
Mathematics: Korn inequalities for the circle and the sphere
Mechanics: Numerical computation of inverse Fourier transforms in the solution of structural and other problems
Metallurgy and Ceramics: Development of nonembrittling cadmium-electroplating solutions. Brillouin zone studies of ternary magnesium alloys. Effect of neutron irradiation on the Charpy V and drop-weight test transition temperatures of various steels and weld metals. Explosion bulge test performance of experimental submerged arc weldments of HY-80 steel. Effect of pH on the rate of corrosion of mild steel at 800°F (316°C)
Radio: Performance of electronic equipment flown in the lightweight, Transosonde meteorological sounding system. Two research tools for use in radar polarization studies: a modified Pincare sphere and a simulator for generating Lissajous patterns
Solid-State Physics: Role of physical defects in the magnetoresistance of copper

ATOMIC ENERGY COMMISSION REPORTS

Reports may be purshased in accordance with instructions on the inside front cover of the U. S. GOVERNEMNT RESEARCH REPORTS. As PB numbers are not indicated, order by series and number. These reports may also be consulted at any AEC Depository Library. A list of these libraries may be obtained from the U. S. Department of Commerce, Office of Technical Services, Washington 25, D. C.

Reproduction in whole or part of any report listed herein is encouraged by the U. S. Atomic Energy Commission, subject to the approval of authors or originating sites. General inquires from the industrial press about AEC-developed information should be directed to the Industrial Information Branch, Atomic Energy Commission, Washington 25, D. C.

General

Sizes of U. S. Steam-Electric Plants, by R. C. Robertson. Oak Ridge National Lab., Oak Ridge, Tenn. May 59. Contract W-7405-eng-26. 15p. Order from LC. Mi $2.40, ph $3.30. CF-59-5-130

Decontamination of dissolver vent gases at Hanford, by A. G. Blasewitz and others. Hanford Works, Richland, Wash. Feb 51. Decl. July 6, 1959. Contract W-31-109-Eng-52. 17p. Order from LC. Mi $2.40, ph $3.30. HW-20332

Unclassified research and development programs executed for the Division of Reactor Development and the Division of Research, September 1959, by L. H. McEwen, comp. General Electric Co. Hanford Atomic Products Operation, Richland, Wash. Oct 59. Contract AT(45-1)-1350. 42p. Order from LC. Mi $3.30, ph $7.80. HW-62362

A method of calculating boundary-layer thickness in axisymmetric nozzles with laminar hypersonic flow, by A. F. Johnson. Sandia Corporation, Albuquerque, N. Mex. Oct 59. 26p. Order from OTS. 75 cents. SC-4370(RR)

Civilian application releases through 1959. Sandia Corporation Bibliography, by the Technical Information Division. Sandia Corporation, Albuquerque, N. Mex. Jan 60. 87p. Order from OTS. $2.25. SCR-150

Report number series, used by the Technical Information Service in cataloging reports, by F. E. Stratton. Oak Ridge National Laboratory, Technical Information Service Extension, Oak Ridge, Tenn. Mar 60. 116p. Order from OTS. $2.75. TID-85 (2nd Rev.)

Biology and Medicine

Uptake of radioisotopes and their transfer through food chains by marine organisms. Annual report 1958-1959, by S. J. Townsley and others. Univ. of Hawaii. Hawaii Marine Lab., Honolulu, Hawaii. Contract AT(04-3)-56. 47p. Order from LC. Mi $3.30, ph $7.80. AECU-4350

Tunover of labeled amino acids and proteins in cancerous tissues and mammals. Literature search, by M. Comstock. Brookhaven National Lab., Upton, N. Y. Oct 58. 5p. Order from LC. Mi $1.80, ph $1.80. AECU-4357

Effect of proton and dueteron irradiation on biolical material. Bibliography, by M. Comstock. Brookhaven National Lab., Upton, N. Y. Sep 58. 2p. Order from LC. Mi $1.80, ph $1.80. AECU-4358

Respiratory pathways in fungi and actinomycetes. Final report for January 1, 1956 to June 30, 1959, by V. W. Cochrane. Wesleyan Univ., Middletown, Conn. Sep 59. Contract AT(30-1)-1813. 29p. Order from LC. Mi $2.70, ph $4.80. AECU-4366

Studies of the effects of ionizing radiation on the ultrastructure of developing nervous tissue as revealed by electron microscopy. Annual report for November 1, 1958, to October 31, 1959, by H. Fernandez-Moran. Massachusetts. General Hospital. Mixter Labs. for Electron Microscopy, Boston, Mass. 1959. Contract AT(30-1)-2278. 36p. Order from LC. Mi $3.00, ph $6.30. AECU-4405

Study of long-term pathologic effects of radioactive isotopes of calcoum and strontium in bone and soft tissues, especially with reference to bone tumor production. Final technical report for

May 16, 1958 to August 31, 1959, by J. F. Kuzma and G. E. Zander-Principati. Marquette Univ., School of Medicine, Milwaukee, Wis. 1959. Contract AT(11-1)-105. 63p. Order from LC. Mi $3.90, ph $10.80. AECU-4409

Final report. Atomic Energy Commission Contract AT(11-1)-194. Chicago Medical School, Chicago, Ill. 1959. 5p. Order from LC. Mi $1.80, ph $1.80. AECU-4432

Final report [on effects of radiation on apples and grapes], by C. Pratt. New York State Agricultural Experiment Station, Geneva, N. Y. [1959]. Contract AT(30-1)-1541. 8p. Order from LC. Mi $1.80, ph $1.80. AECU-4475

Biological and Medical Research Division semiannual report, January through June, 1958, by L. R. Drapper and others. Argonne National Laboratory, Lemont, Ill. Sep 58. Contract W-31-109-eng-38. 152p. Order from OTS. $3.00. ANL-5916

Structure and function of genetic elements. Brookhaven Symposia in Biology. No. 12, held June 1-3, 1959, by M. Levine and others. Brookhaven National Laboratory, Biology Dept., Upton, N. Y. 1959. 187p. Order from OTS. $2.00. BNL-558 (C-29)

Radiosensitivity of various species of bacteria under different environmental conditions. Final report for the period December 15, 1958 to August 31, 1959, by B. E. Proctor and others. Massachusetts Inst. of Tech., Cambridge, Mass. 1959. Contract AT(30-1)-1719. 22p. Order from LC. Mi $2.70, ph $4.80. NYO-2861

Radiation background in albuquerque, New Mexico, during and after the teapot series, by H. H. Sanders and T. B. Cook, Jr. Sandia Corp., Albuquerque, N. Mex. Sep 55. 12p. Order from LC. Mi $2.40, ph $3.30. SCTM-206-55-(51)

The chemical, physical, and biological properties of human serum phospholipides. Thesis, by G. J. Nelson. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. Jan 60. Contract W-7405-eng-48. 76p. Order from OTS. $2.00. UCRL-9040

Biological mixtures, some biophysical problems, and the stable-flow free-boundary method, by H. C. Mel. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. Feb 60. Contract W-7405-eng-48. 36p. Order from OTS. $1.00. UCRL-9108

Chemistry—General

Separation factor and transfer coefficients associated with ion exchange separation of enriched as-depleted As, by S. H. Jury. Oak Ridge National Lab., Oak Ridge, Tenn. Aug 52. Decl. December 17, 1958. Contract W-7405-eng-26. 14p. Order from LC. Mi $2.40, ph $3.30. CF-52-8-218

Equilibrium concentrations of several gaseous species (CO, CO_2, CH_4, H_2, H_2O) in equilibrium with graphite at very low hydrogen and oxygen levels, by D. V. Ragone. General Dynamics Corp., Dept. of Chemical and Metallurgical Engineering, Univ. of Michigan, Ann Arbor, Mich. Mar 60. Contract AT(04-3)-187. 15p. Order from OTS. 50 cents. GA-1109

A study of the Miller's fluorinated lubricant - chlorine trifluoride reactions, by G. Stern and R. P. Bell. Goodye r Atomic Corp., Tech. Div., Process Engineering Dept., Portsmouth, Ohio. Jan 60. Contract AT(33-2)-1. 22p. Order from OTS. 75 cents. GAT-290

Infrared spectra of ClO_2, ClO_2F, and ClO_3F, by E. A. Smith and tohers. Goodyear Atomic Corp Portsmouth, Ohio. Oct 59. Contract AT(33-2)-1. 6p. Order from LC. Mi $1.80, ph $1.80. FAT-T-687

The melting points of uranium dioxide, uranium monocarbide, and uranium mononitride, by H. W. Newkirk and J. L. Bates. General Electric Co., Hanford Atomic Products Operation, Richland, Wash. Mar 59. 5p. Order from LC. Mi $1.80, ph $1.80. HW-59468

Decontamination studies for HAPO high temperature reactor recirculation systems. Progress report for June 1958 to June 1959, by L. D. Perrigo and R. D. Weed. General Electric Co., Hanford Atomic Products Operation, Richland, Wash. June 59. Contract W-31-109-Eng-52. 34p. Order from LC. Mi $3.00, ph $6.30. HW-60677

Exchange studies of the uranium-tributyl phosphate reaction, by B. Keisch. Phillips Petroleum Co. Atomic Energy Div., Idaho Falls, Idaho. Nov 59. Contract AT(10-1)-205. 23p. Order from LC. Mi $2.40, ph $3.30. IDO-14490

Measurement error - identification and estimation, by F. H. Tingey. Phillips Petroleum Co. Atomic Energy Div., Idaho Falls, Idaho.

Mar 60. Contract AT(10-1)-205. 21p. Order from OTS. 75 cents. IDO-14508

Process of the storage of plutonium hexafluoride, by N. J. Hawkins Knolls Atomic Power Lab., Schenectady, N. Y [1957] Decl. Oct 15, 1959 Contract W-31-109-eng-52. 9p. Order from LC. Mi $1.80, ph $1.80. KAPL-M-NJH-2

The reliability of determining impurity titanium in Zircaloy, by W. S. Horton. Knolls Atomic Power Lab., Schenectady, N. Y. Dec 59. Contract W-31-109-Eng-52. 20p. Order from LC. Mi $2.40, ph $3.30. KAPL-M-WSH-5

Estimated upper bounds to the half-life of thermal decomposition of ammonia, hydrogen, methane, and propane, by D. Herschbach Los Alamos Scientific Lab., N. Mex. Aug 56. Decl. Aug 11, 1959. Contract W-7405-eng-36. 30p. Order from LC. Mi $2.70, ph $4.80. LAMS-1954

Process development of 2, 2-dinitropropyl acrylate, by T. M. Benziger and others. Loa Alamos Scientific Lab., N. Mex. Oct 55. Decl. Sep 25, 1959. Contract W-7405-eng-36. 45p. Order from LC. Mi $3.30, ph $7.80. LAMS-1974

Space groups and atomic parameters in some graphite-alkali metal lamellar compounds, by G. M. Wolten. Atomics Interantional. A Division of North American Aviation, Inc., Canoga Park, Calif. Apr 60. Contract AT(11-1)-GEN-8. 18p. Order from OTS. 75 cents NAA-SR-4545

Solubility of terphenyls at room temperature, by R. T. Keen. Atomics International Division., North American Aviation, Inc., Canoga Park, Calif. Jan 58. 4p. Order from LC. Mi $1.80, ph $1.80. NAA-SR-Memo-2412

Thermo-physical properties of OMRE circulating coolant, by G. Asanovich. Atomics International Div., North American Aviation, Inc., Canoga Park, Calif. May 59. 16p. Order from LC. Mi $2.40, ph $3.30. NAA-SR-Memo-3843

Thermodynamic properties of sulfuryl fluoride from 12°K to its boiling point. The entropy from molecular and spectroscopic data, by F. J. Bockhoff and others. Western Reserve Univ., Morley Chemical Lab., Cleveland, Ohio. Sep 59. Contract AT(30-1)-824. 23p. Order from LC. Mi $2.70, ph $4.80. NYO-4885

The system lithium hydride--calcium hydride, by C. E. Messer. Tufts Univ., Medford, Mass. Sep 59. Contract AT(30-1)-1410. 12p. Order from LC. Mi $2.40, ph $3.30. NYO-8026

Calculation of suspension peptization, by F. H. Sweeton. Oak Ridge National Lab., Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 131p. Order from OTS. $2.75. ORNL-2791

Reduction of cupric oxide by hydrogen. 1 Fundamental kinetics, by W. D. Bond and others. Oak Ridge National Lab., Oak Ridge, Tenn. Feb 60. Contract W-7405-eng-26. 26p. Order from OTS. $1.00. ORNL-2815

Purification of Americium chloride solutions by mercury cathode electrolysis, by J. L. Holst and C. W. Barrick. The Dow Chemical Co., Rocky Flats Plant, Denver, Colo. Mar 60. Contract AT(29-1)-1106. 9p. Order from OTS. 50 cents. REP-183

Intermetallic compounds between lithium and lead V. Brillouin polyhedra of the various phases, by W. J. Ramsey and J. O. Jepson. University of California, Lawrence Radiation Lab., Livermore, Calif. Nov 59. Contract W-7405, eng-48. 16p. Order from OTS. 50 cents. UCRL-5801

Chemistry Division semiannual report, June through November 1959. University of California, Lawrence Radiation Laboratory, Livermore, Calif. Feb 60. Contract W-7405-eng-48. 103p. order from OTS. $2.50. UCRL-9093

Longitudinal dispersion in two-phase continuous - flow operations: Solution and tables for concurrent flow, by T. Miyauchi and others. University of California, Lawrence Radiation Lab., Berkeley, Calif. Mar 60. Contract W-7405-eng-48. 24p. Order from OTS. 75 cents. UCRL-9112

The gravimetric determination of hafnium and zirconium in hafnium materials. (Tentative Method), by T. M. Reinhold. Westinghouse Electric Corp. Bettis Plant, Pittsburgh, Pa. Apr 59. 4p. Order from LC. Mi $1.80, ph $1.80. WAPD-M(GLA)-718

An evaluation of uranium salvage operations - a case study, by A. E. Sands. Union Carbide Nuclear Co. Div. of Union Carbide Corp., Y-12 Plant, Oak Ridge, Tenn. Dec 59. Contract W-7405-eng-26. 75p. Order from OTS. $2.00. Y-1279

Chemistry—Radiation and Radiochemistry

Effectsof gamma radiation on the kinetics of chlorination of some aromatic hydrocarbons. Part I. Chlorination of mesitylene and naphthalene. Part II. Chlorination of ethyl benezen Part III. Chlorination of M-xylene and methyl naphthalenes, by J. J. Martin and others. University of Michigan. Engineering Research Inst.; Ann Arbor, Mich. [195?] 69p. Order from LC. Mi $3.90, ph $10.80. AECU-4339

Radiochemical separation of cadmium and the application of vacuum distillation of metals to radiochemical separations, by J. R. DeVoe. University of Michigan, Ann Arbor, Mich. Dec 59. Contract AT(11-1)-70. 91p. Order from OTS. $2.50. AECU-4610

California production in the high flux isotope reactor, by H. C. Claiborne and M. P. Lietzke. Oak Ridge National Lab., Oak Ridge, Tenn. Aug 59. 24p. Order from LC. Mi $2.70, ph $4.80. CF-59-8-125

Removal of iodine from aqueous solutions by sparging, by C. H. Holm. Hanford Works, Richland, Wash. June 51. Decl. with detetions July 7, 1959. Contract W-31-109-Eng-52. 39p. Order from LC. Mi $3.00, ph $6.30. HW-20803(Del.)

The stability of purex solvent to radiation and chemical attack, by J. L. Swanson. General Electric Co. Hanford Atomic Products Operation, Richland, Wash. May 55. Decl. with deletions Aug. 25, 1959. Contract W-31-109-Eng-52. 30p. Order from LC. Mi $2.70, ph $4.80. HW-38263(Del.)

General research quarterly report for January, February, March 1950. Mound Lab., Miamisburg, Ohio. Apr 50. Decl. Nov 24, 1959. Contract AT-33-3-GEN-53. 27p. Order from LC. Mi $2.70, ph $4.80. MLM-443-3

General research report for June 26 to September 18, 1950. (Actinium Volume). Mound Lab., Maimisburg, Ohio. Oct 50. Decl. Nov 24, 1959. Contract AT-33-1-gen-53. 16p. Order from LC. Mi $2.40, ph $3.30. MLM-499

Tentative procedure for the analysis of mixtures containing radium-226, actinium-227, and thorium-228, by H. W. Kirby. Mound Lab., Miamisburg, Ohio. Oct 52. Decl. Nov 24, 1959. Contract AT-33-1-gen-53. 9p. Order from LC. Mi $1.80, ph $1.80. MLM-773(Rev.)

The radiochemistry of cadmium, by J. R. DeVoe. The University of Michigan, Ann Arbor, Mich. Jan 60. 57p. Order from OTS. 75 cents. NAS-NS-3001

The radiochemistry of thorium, by E. K. Hyde. Lawrence Radiation Lab., University of Calif., Berkeley, Calif. Jan 60. 70p. Order from OTS. 75 cents. NAS-NS-3004

The radiochemistry of fluorine, chlorine, bromine and iodine, by J. Kleinberg and G. A. Cowan. University of California. Los Alamos Scientific Laboratory, Los Alamos, N. Mex. Jan 60. 42p. Order from OTS. 50 cents. NAS-NS-3005

The radiochemistry of chromium, by J. Pijck. University of Ghent, Laboratory for Analytical Chemistry, Belgium, Jan 60. 34p. Order from OTS. 50 cents. NAS-NS-3007

Report on ammonia synthesis test, by Y. Solomon and P. Cohen. Westinghouse Electric Corp., Atomic Power Div., Pittsburgh, Pa. Mar 54. Decl. with deletions Apr 29, 1957. 9p. Order from LC. Mi $1.80, ph $1.80, WAPD-CP-354(Del.)

Chemistry—Separation Processes for Plutonium and Uranium

Chemical Engineering Division summary report, for October, November, December, 1959, by S. Lawroski and others. Argonne National Laboratory, Argonne, Ill. Feb 60. Contract W-31-109-eng-38. 170p. Order from OTS. $3.00. ANL-6101

PRFR pilot leaching plant--preliminary process design, by H, A. McLain Oak Ridge National Lab., Tenn. July 59. Contract W-7405-eng-26. 59p. Order from LC. Mi $3.60, ph $9.30. CF-59-7-76

Report of chemistry and chemical engineering for November, December, 1956, January, 1957, by D. H Ahmann and others. June 57. Decl. Mar 17, 1960. Contract W-31-109-Eng-52. 67p Order from OTS. 50 cents. KAPL-1696

Gaseous chemical treatment of irradiated uranium dioxide, by J. Guon and F. D. Rosen. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. Jan 60. Contract AT(11-1)-GEN-8. 18p. Order from OTS. 75 cents. NAA-SR-4612

Laboratory development of the sulfex process for the dissolution of consolidated Edison power reactor fuel, by L. M. Ferris and A. H. Kibbey. Oak Ridge National Laboratory, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 28p. Order from OTS. $1.00. ORNL-2714

Recovery of uranium and thorium from graphite fuels. I. Laboratory development of a grind-leach process, by M. J. Bradley and L. M. Ferris. Oak Ridge National Laboratory, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 38p. Order from OTS. $1.25. ORNL-2761

Tributyl phosphate-hydrocarbon diluent repurification in radiochemical processing at ORNL: Status summary, by W. Davis, Jr. Oak Ridge National Laboratory, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 28p. Order from OTS. $1.00. ORNL-2848

Chemical feasibility of homogeneous neutron poisons for criticality controls in consolidated Edison fuel processing solutions, by J. G. Moore and R. H. Rainey. Oak Ridge National Laboratory, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 22p. Order from OTS. 75 cents. ORNL-2854

Proceedings of the AEC Symposium for chemical processing of irradiated fuels from power, test, and research reactors held at Richland, Wash., on October 20 and 21, 1959, by J. E. Travis and others. General Electric Co., Hanford Atomic Products Operation, Richland, Wash. Jan 60. 455p. Order from OTS. $4.50. TID-7583

Controlled Thermonuclear Processes

Effect of plasma potential on DCX steady state, by T. K. Fowler. Oak Ridge National Laboratory, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 22p. Order from OTS. 75 cents. ORNL-2914

The hard-core pinch. Part I, by D. H. Birdsall, S. A. Colgate and H. P. Furth. University of California. Lawrence Radiation Lab., Livermore, Calif. July 59. Contract W-7405-eng-48. 13p. Order from LC. Mi $2.40, ph $3.30. UCRL-5599

Zeus firing systems, by J. A. Johnson. Sandia Corporation, Albuquerque, N. Mex. Mar 60. 10p. Order from OTS. 50 cents. SCTM-214-59(12)

Criticality Studies

Flat flux cores, by R. Balent. Atomics Intenational Div., North American Aviation, Inc., Canoga Park, Calif. June 54. Decl. with detetions Oct. 22, 1959. 15p. Order from LC. Mi $2.40, ph $3.30. NAA-SR-Memo-913(Rev. II)(Del.)

Nuclear calculations for the organic moderated exponential experiments, by J. J. McClure. Atomics International Div., North American Aviation, Inc., Canoga Park, Calif. Mar 59. 8p. Order from LC. Mi $1.80, ph $1.80. NAA-SR-Memo-3659

Calculations on the TRX critical assembly, by L. Maki and W. Allen. Atomics International Div., North American Aviation, Inc., Canoga Park, Calif. [1959?] 5p. Order from LC. Mi $1.80, ph $1 80. NAA-SR-Memo-3892

Critical mass of an OMR core using plate type fuel elements, by H. C. Field. Atomics International Div., North American Aviation, Inc., Canoga Park, Calif. June 59. 4p. Order from LC. Mi $1.80, ph $1.80. NAA-SR-Memo-3980

Critical mass calculations--correction, by R. A. Blaine. Atomics International Div., North American Aviation, Inc., Canoga Park, Calif. Aug 59. 4p. Order from LC. Mi $1.80, ph $1.80. NAA-SR-Memo-4299

Safety analysis of enriched uranium processing. A study of the possible consequences of nuclear accidents in licensed plants processing unirradiated enriched uranium, by H. T. Williams and others. CONVAIR, A Division of General Dynamics Corp., Fort Worth, Tex. Mar 60. Contract AT(30-1)-2271. 199p. Order from OTS. $3.00. NYO-2980

Geology and Mineralogy

Geochemistry and physics of ocean circulation, by W. S. Broecker and others. Columbia University, Lamont Geological Observatory, Palisades, N. Y. 1959? Contract AT(30-1)-1808. 36p. Order from LC. Mi $3.00, ph $6.30. NYO-2921

Thermograd measurements in water and sediments of the deep sea, by M. Ewing, R. D. Gerard, and M. Langseth. Columbia University, Lamont Geological Observatory, Palisades, N. Y. Sep 59. Contract AT(30-1)-1808. 42p. Order from LC. Mi $3.30, ph $7.80. NYO-2922

Preliminary drilling in the Powder River Basin, Converse, Campbell, and Johnson Counties, Wyoming, by H. E. Geslin and C. P. Bromley. Division of Raw Materials, AEC Denver Area Office, Denver, Colo. June 57. 26p. Order from OTS. 75 cents. RME-1070 (Rev.)

Preliminary report on the geology and uranium deposits of Haiwee Ridge, Inyo County, California, by W. R. Power. U. S. Atomic Energy Commission, Grand Junction Operation Office, Production Evaluation Div., Salt Lake Branch, Salt Lake City, Utah. May 58. 39p. Order from OTS. $1.25. RME-2066

Health and Safety

A system for the automatic computation of disintegration rates from radiochemical data, by W. R. Collins, Jr. Health and Safety Laboratory, AEC, New York Operations Office, New York, N. Y. May 59. 45p. Order from OTS. $1.50. HASL-64

Strontium program. Quarterly summary report for September 1 through December 1, 1959, by E.P. Hardy, Jr. and S. Klein. Health and Safety Laboratory, AEC, New York Operations Office, New York, N. Y. Jan 60. 221p. Order from OTS. $3.50. HASL-77

Fallout program. Quarterly summary report for December 1, 1959 through March 1, 1960, by E. P. Hardy, Jr. and S. Klein. Health and Safety Laboratory, AEC, New York Operations Office, New York, N. Y. Apr 60 180p. Order from OTS. $3.00. HASL-84

Close-in-time-of-arrival measurements for yield of underground Rainier shot, by D. C. Anderson and others. University of California, Lawrence Radiation Laboratory, Livermore, Calif. Dec 59. 168p. Order from OTS. $3.00. WT-1495

Surface motion from an underground detonation, by L. M. Swift and others. Headquarters Field Command, Defense Atomic Support Agency, Sandia Base, Albuquerque, N. Mex. Mar 60. 82p. Order from OTS. $2.25. WT-1528

Instruments

An absolute mass rate flowmeter, by F. A. Guevara and others Los Alamos Scientific Lab , N. N. Mex. [1958?] Contract W-7405-eng-36. 9p. Order from LC. Mi $1.80, ph $1.80. AECU-4249

A scintillation nuclear incident alarm monitor, by W. G. Spear. General Electric Co., Hanford Atomic Products Operation, Richland, Wash. Mar 59. Contract W-31-109-Eng-52. 13p. Order from LC. Mi $2.40, ph $3.30. HW-59612

The operation and maintenance of an alpha energy analyzing system, by F. P. Brauer and R. E. Connally. General Electric Co., Hanford Atomic Products Operation, Richland, Wash. July 59. 33p. Order from LC. Mi $3.00, ph $6.30. HW-60974

Ultrasonic resin level detector, by D. O. Hunter and C. L. Pleasance. Hanford Atomic Products Operation, Richland, Wash. Jan 60 Contract AT(45-1)-1350. 22p. Order from OTS. 75 cents. HW-63632

A continuous boiling point analyzer and its application to the hydrogen fluoride-water system, by W. S. Pappas, Union Carbide Nuclear Co , Division of Union Carbide Corportation, Oak Ridge Gaseous Diffusion Plant, Oak Ridge, Tenn. Feb 60. 15p. Order from OTS. 50 cents. K-1354

A high-temperature metal resistance furnace for vacuum or pressure operation, by M. R. Nadler, J. E. Runyan, and C. P. Kempter. University of California. Los Alamos Scientific Laboratory, Los Alamos, N. Mex. Dec 59. Contract W-7405-ENG-36. 17p. Order from OTS. 75 cents. LAMS-2393

Strontium-90 power project quarterly progress report I. Martin Co. Nuclear Div., Baltimore Md. Jan 59. 52p. Order from LC. Mi $3.60, ph $9.30. MND-SR-1672

The non-linear behavior or large permanent-magnet flowmeters, by G. E. Turner. Atomics International A Division of North American Aviation, Inc., Canoga Park, Calif. Apr 60. Contract AT(11-1)-GEN-8. 18p. Order from OTS. 50 cents. NAA-SR-4544

An analytical method of determining pole locations of certain types of feedback amplifiers, by R.L. Gamblin. Princeton University, Project Matterhorn, Princeton, N. J. Feb 59. Contract AT (30-1)-1238. 16p. Order from LC. Mi $2.40, ph $3.30. NYO-2396

Calibration and testing of 2- and 3-1/2-in. magnetic flowmeters for high-temperature NaK service, by R. G. Affel, G. H. Burger, and C. L. Pearce. Oak Ridge National Laboratory, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 71p. Order from OTS. $2.25. ORNL-2793

A theoretical examination of a variable reluctance diaphragm gage developed at Sandia Corporation, by G. E. Reis. Sandia Corporation, Albuquerque, N. Mex. Mar 60. 52p. Order from OTS. $1.50. SCR-162

On the relationship between DC large signal current gain and AC small signal current gain for a common base transistor connection, by T. E. Lommasson. Sandia Corp., Albuquerque, N. Mex. Oct 55. 4p. Order from LC. Mi $1.80, ph $1.80. SCTM-219-55-53

Theory of an electrostatic energy supply; analysis of nondestructive methods for the measurement of internal charges, by H. G. Baerwald. Sandia Corporation, Albuquerque, N. Mex. Mar 60. 89p. Order from OTS. $2.25. SCTM-241A-59(51)

Remote control equipment. A literature search, by H. D. Raleigh. Technical Information Sevvice, Oak Ridge, Tenn. Mar 60. 20p. Order from OTS. 75 cents. TID-3549

Transducer system response tests, by R. Masnovi. Westinghouse Electric Corp. Atomic Power Div., Pittsburgh, Pa. Oct 58. 26p. Order from LC. Mi $2.70, ph $4.80. WAPD-TH-450

Evaluation of aerial survey meter v-780, by R. B. Martin. Office of Civil and Defense Administration, Oak Ridge, Tenn. Nov 59. 40p. Order from OTS. $1.25. WT-1721

Metallurgy and Ceramics

Progress relating to civilian applications during February, 1960, by R. W. Dayton and C. R. Tipton, Jr. Battelle Memorial Institute, Columbus, Ohio. Mar 60. Contract W-7405-eng-92. 95p. Order from OTS. $2.25. BMI-1423

Development of thorium-uranium-base fuel alloys, by M. S. Farkas, A. A. Bauer, and R. F. Dickerson. Battelle Memorial Institute, Columbus, Ohio. Mar 60. Contract W-7405-eng-92. 28p. Order from OTS. $1.00. BMI-1428

Extrusion of uranium for Hanford cored slug program - VIII, by G. T. Murray and R. M. Treco. Bridgeport Brass Company, Bridgeport, Conn. Sep 56. Decl. Mar. 24, 1960. Contract AT(30-1)-1405. 22p. Order from OTS 35 cents. BRB-21

Extrusion of uranium for Hanford cored slug program - IX, by G. T. Murray and R. M. Treco. Bridgeport Brass Company, Bridgeport, Conn. Aug 56. Decl. Mar. 24, 1960. Contract AT(30-1)-1405. 29p. Order from OTS. 35 cents. BRB-22

Extrusion of uranium for Hanford cored slug program - X, by G. T. Murray and R. M. Treco. Bridgeport Brass Company, Bridgeport, Conn. Sep, 56. Decl. Mar. 24, 1960. Contract AT(30-1)-1405. 46p. Order from OTS. 45 cents. BRB-23

Monthly progress report covering period September through October, 1955, by R. M. Treco. Bridgeport Brass Company, Bridgeport, Conn. Nov 55. Decl. Mar. 24, 1960. Contract AT(30-1)-1405. 16p. Order from OTS. 30 cents. BRB-25

Monthly progress report covering period November through December, 1956, by A. E. Schuetz and H. S. Rubenstein. Bridgeport Brass Company, Bridgeport, Conn. Mar 57. Decl. Mar. 24, 1960. Contract AT(30-1)-1405. 53p. Order from OTS. 50 cents. BRB-37

Process development quarterly report covering the period from January through March, 1957, by E. E. Schuetz and H. S. Rubenstein. Bridgeport Brass Company, Bridgeport, Conn. June 57. Decl. Mar. 24, 1960. Contract AT(30-1)-1405. 80p. Order from OTS. 55 cents. BRB-38

Graphite-metal compatibility at high temperatures, by J. J. Barry and others. General Dynamics Corporation. June 59. Contract AT(04-3)-187. 70p. Order from OTS. $2.00. GA-782

Compatibility of zirconium hydride and carbon dioxide, by H. E. Shoemaker. General Dynamics Corporation July 59. Contract AT (04-3)-187. 17p. Order from OTS. 75 cents. GA-849

Evaluation of aluminum for use in reactors cooled by high-temperature recirculating water, by J. A. Ayres. Hanford Atomic Products Operation, Richland, Wash. Feb 60. Contract AT (45-1)-1350. 25p. Order from OTS. $1.00. HW-61757 REV

Fabrication of aluminum - 1.8 w/o plutonium PCTR loading, by J. B. Burnham. Hanford Atomic Products Operation, Richland, Wash. Nov 59. Contract AT(45-1)-1350. 22p. Order from OTS. 75 cents. HW-62821

Sintering studies on the system UO_2-PuO_2 Part II - Sinterability, by T. D. Chikalla. Hanford Atomic Products Operation, Richland, Wash. Dec 59. Contract AT(45-1)-1350. 35p. Order from OTS. $1.00. HW-63081

Specifications for swaged UO_2 19-rod cluster, PRTR fuel element Mark I, by M. K. Millhollen Hanford Atomic Products Operation, Richland, Wash. Mar 60. Contract AT(45-1)-1350. 28p. Order from OTS. $1.00. HW-64359

Uranium glasses. I. Fundamental considerations, by C. D. Wirkus and D. R. Wilder. Iowa State University of Science and Technology, Ames Laboratory, Ames, Iowa. Feb 60. Contract W-7405-eng-82. 19p. Order from OTS. 75 cents. IS-107

Mechanical properties of stainless steel - UO_2 dispersion fuel elements, by W. D. Valovage and R. A. Siergiej. General Electric Co., Knolls Atomic Power Laboratory, Schenectady N. Y. July 59. Contract W-31-109-Eng-52. 12p. Order from OTS. 75 cents. KAPL-1590

Internal-pressure creep-rupture tests of Zircaloy-2 tubing, by G. J. Sokol and D. T. Groleau. General Electric Co., Knolls Atomic Power Lab., Schenectady, N. Y. Jan 60. Contract W-31-109-Eng-52. 15p. Order from OTS. 75 cents. KAPL-2072

Properties of beryllium metal, by H. Suss. Knolls Atomic Power Lab., Schenectady, N. Y. Sep 59. 15p. Order from LC. Mi $2.40, ph $3.30. KAPL-M-HOS-7

Shot peening for protection against stress corrosion cracking, by H. Suss. Knolls Atomic Power Lab., Schenectady, N. Y. Sep 59. 15p. Order from LC. Mi $2.40, ph $3.30. KAPL-M-HOS-9

Progress report on weld penetration study of Zircaloy-2 hafnium welds as determined by radiographic inspection, by M. A. Gerardi. Knolls Atomic Power Lab., Schenectady, N. Y. Dec 59. 11p. Order from LC. Mi $2.40, ph $3.30. KAPL-M-MAG-1

Electrophoretic processes - nuclear aspects. Final report for December 1, 1956 through June 30, 1959, by R. A. Keeler and S. J. Klach. Vitro Laboratories, West Orange, N. J. Sep 59. Contract AT(30-1)-1996. 42p. Order from OTS. $1.25. KLX-10119

Fabrication of zirconium-clad uranium fuel elements, by P. Loewenstein. Massachusetts Institute of Technology, Cambridge, Mass. Jan 51. Decl. Mar. 17, 1960. 5p. Order from OTS. 25 cents. MIT-PL-12

Some properties of uranium-molybdenum alloy fuels for organic moderated reactors, by W. H. Friske. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. Apr 60. Contract AT(11-1)-GEN-8. 26p. Order from OTS. 75 cents. NAA-SR-4646

Evaluation of irradiated experimental OMR fuel elements I, by J. H. Walter, E. E. Garrett, and J. M. Davis. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. Apr 60. Contract AT(11-1)-GEN-8. 49p. Order from OTS. $1.25. NAA-SR-4670

On the mechanisms of volume self-diffusion in α-Fe and γ-Fe, by C. J. Meechan. Atomics International, A Division of North American Aviation, Inc., Canoga Park, Calif. Apr 60. Contract AT(11-1)-GEN-8. 10p. Order from OTS. 50 cents. NAA-SR-4806

Development of roll bonded subassembles, by F. G. Stengel. Westinghouse Electric Corp Atomic Power Div., Pittsburgh, Pa. Dec 54. Decl. with deletions Feb 20, 1957 Contract AT-11-1-GEN-14. 24p. Order from LC. Mi $2.70, ph $4.80. WAPD-116 (Del.)

Particle Accelerators and High-Voltage Machines

Linac injection for the 340-Mev Berkeley electron synchrotron: Part I - theoretical, by K. C. Crebbin and J R. Hiskes. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. Jan 60. Contract W-7405-eng-48. 24p. Order from OTS. 75 cents. UCRL-9057

Physics and Mathematics

Structure Determination I, by E. G. Sherry. Argonne National Laboratory, Argonne, Ill. Mar 60. Contract W-31-109-eng-38. 17p. Order from OTS. 75 cents. ANL-6147

Physical Properties and Flow Characteristics of Air, by J. L. Hobbs and M. E. Lapides. General Electric, Aircraft Nuclear Propulsion Department, Cincinnati 15, Ohio. Mar 56. Contract AT(11-1)-171. 57p. Order from OTS. $1.75. APEX-527

Liquid metal fuel reactor experiment, by W. R. Foley, J. S. Makris, and W. E. Leyda. Research Center Alliance, Ohio. Mar 60. Contract AT(30-1)-1940. 42p. Order from OTS. $1.25. BAW-1095

Economically Optimum Sweepdown Criterion For Chemical Processing, by F. H. Tingey. Phillips Petroleum Co., Idaho Operations Office. Nov 59. Contract AT (10-1)-205). 21p. Order from OTS. 75 cents IDO-14498

Scattering of Neutrons by Gaseous Molecules, by H. L. McMurry. Phillips Petroleum Co., Idaho Operations Office. Mar 60. Contract AT (10-1) -205). 54p. Order from OTS. $1.75. IDO-16592

Design and Testing of Lens Systems, by F. A. Lucy. University of California, Los Alamos Scientific Laboratory, Los Alamos, N. Mexico. Distributed Nov 59. Contract W-7405-Eng. 181p. Order from OTS. $3.00. LAMS-2248

Theory of Gravitation, 1920 to present (Bibliography) by R. H. Lier. University of California, Los Alamos Scientific Laboratory, Los Alamos, N. Mexico. Distributed Apr 60. Contract W-7405-Eng. 155p. Order from OTS. $3.00. LAMS-2323

Methods of Differencing in Eulerian Hydrodynamics, by H. J. Longley. University of California, Los Alamos Scientific Laboratory, Los Alamos, N. Mexico. Distributed Apr 60. Contract W-7405-Eng. 83p. Order from OTS. $2.25. LAMS-2379

Aim-5, A Multigroup, One-dimensional Diffusion Equation Code, by H. P. Flatt, and D. C. Baller. Atomics International, North American Aviation, Inc., P. O. Box 309, Canoga Park, Calif. Mar 60. Contract AT(11-1)-GEN-8. 52p. Order from OTS. $1.50. NAA-SR-4694

Physics Division Annual Progress Report for period ending Feb 60, by J. L. Fowler. Oak Ridge National Laboratory, Oak Ridge, Tenn. Contract W-7405-eng-26. 98p. Order from OTS. $2.50. ORNL-2910

Heat Transfer, Burnout, and Pressure Drop for Water in swirl flow through tubes with internal twisted tapes, by W. R. Gambill, R. D. Bundy, and R. W. Wansbrough. Oak Ridge National Laboratory, Oak Ridge, Tenn. Contract W-7405 Eng-26. 105p. Order from OTS. $2.50. ORNL-2911

Logarithms of Factorials from 1 to 2000, by D. B. Owen, and C. M. Williams. Sandia Corp., Albuquerque, N. Mex. Dec 59. Order from OTS. 36p. $1.00. SCR-158

Functional Integrals and Statistical Physics, by S. G. Brush. University of California, Lawrence Radiation Laboratory, Livermore, Calif. Oct 59. Contract W-7405-eng-48. 39p. Order from OTS. $1.25. UCRL 5694-T

A Table of some Spherical Harmonics, by D. F. Abell. University of California, Lawrence Radiation Laboratory, Livermore, Calif. Nov 59. Contract W-7405-eng-48. 6p. Order from OTS. 50 cents. UCRL 5713

IBM-704 Codes for Reactivity step Calculations, by C. E. Cohn, and B. J. Toppel. Argonne National Laboratory, Argonne, Ill. Mar 60. Contract W-31-109-eng-38. 30p. Order from OTS. $1.00. ANL-6134

Table of Legendre Functions of the second kind, $Q_n(X)$, by B. M. Johnston. University of California, Lawrence Radiation Laboratory, Livermore, Calif. Jan 60. Contract W-7405-eng-48. 25p. Order from OTS. 75 cents. UCRL 5817

Remarks on excited states of even-even Nuclei and on the existence of a complex vibrational second excited state, by H. E. Bosch. University of California, Lawrence Radiation Laboratory, Berkeley, Calif. Feb 60. Contract W-7405-eng-48. 12p. Order from OTS. 50 cents. UCRL 9074

Reactor Physics and Mathematics, Bettis Technical Review. Bettis Atomic Power Laboratory, Pittsburgh, Pa. Feb 60. Contract AT-11-1-GEN-14. 86p. Order from OTS. $2.25. WAPD-BT-17

August 19, 1960
Vol. 34, No. 2

. . . A monthly listing of Government research reports available to industry . . .

UNIV... OF MICHIGAN
1960

U. S. Government

RESEARCH REPORTS

In this issue:

Welding of High-Strength Steels for Aircraft and Missile Applications

Some New Types of Neutron-Shielding Materials

Water Vapor Pump Study

A Study of Ternary Phase Diagrams of Tungsten and Tantalum

Shop Practice Suggestions

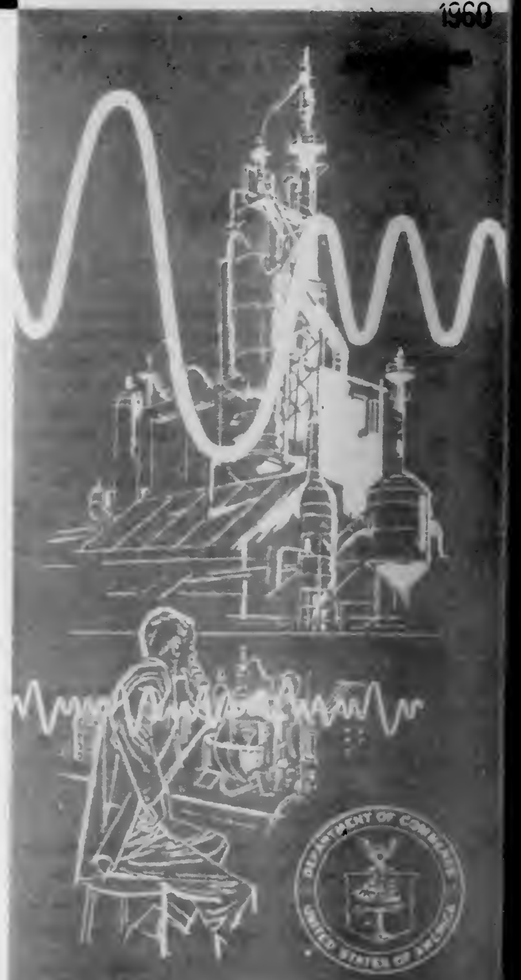
Synthesis of New High Temperature Materials

Development of Protective Coatings for Refractory Metals

Thin Metal Films as Corrosion Indicators

Study of Hydrofoil Seacraft

Complete list of printed reports



U. S. DEPARTMENT OF COMMERCE
BUSINESS AND DEFENSE SERVICES ADMINISTRATION
Office of Technical Services

The PB Reports . . .

announced in this publication have just been released, usually by agencies of the U. S. Government, for dissemination to the public. In most instances they result from Government or Government-sponsored research.

The Office of Technical Services is responsible, under Public Law 776, 81st Congress, for the collection and distribution of these technical reports in the interest of American science and industry.

The more important reports are reprinted for sale to the public by OTS. Many of the reports are so specialized that the demand for them does not warrant reproduction of printed copies; originals of these documents are deposited at the Library of Congress. There they may be inspected in the Annex Reading Room, or copies may be ordered from the Library in either photocopy or microfilm.

PB reports of special interest to smaller businesses are abstracted in OTS's monthly *Technical Reports Newsletter*, available from the Superintendent of Documents, Washington 25, D. C., at $1 a year domestic, $1.50 foreign.

Since 1945 thousands of business firms have used PB reports in their research programs. These reports now constitute one of the world's largest collections of non-confidential technical information, numbering over 250,000 items. OTS has published catalogs of related reports in more than 300 areas of industrial interest. For further information relative to any of its activities, you are invited to write OTS, U. S. Department of Commerce, Washington 25, D. C.

Except to the extent indicated by acknowledgment of authorship, OTS does not edit PB reports, nor does it accept responsibility for the information and conclusions contained in them. If copyrighted material appears, permission for its use should be requested from the copyright owners. Any national security restrictions that may have applied to these reports have been removed. Patents may cover the subject matter of any report, and the reader is advised to make patent searches before developing applications based on the reports.

How To Order

ALWAYS USE COMPLETE TITLE AND PB NUMBER of each report ordered. The letter "s" accompanying some PB numbers means "supplement," "t" means "translation," and "r" means a partial or complete revision. These letters should be included as part of the PB number. Prepayment is required.

TO ORDER FROM LC • Address your order to Library of Congress, Photoduplication Service, Publications Board Project, Washington 25, D. C. Make check or money order payable to Chief, Photoduplication Service, Library of Congress. State whether report is desired in microfilm or photocopy. Microfilm copies are in 35 millimeter film and require special reading equipment; if you do not have such a machine you may be able to use one at a library in your area.

TO ORDER FROM OTS • Address your order to Office of Technical Services, U. S. Department of Commerce, Washington 25, D. C. Make check or money order payable to OTS, Department of Commerce. Reports available from OTS may also be ordered through Department of Commerce field offices.

TO ORDER FROM OTHER SOURCES • When an agency other than OTS or LC is the source, use the full address included in the abstract of the report. Make check or money order payable to that agency.

U.S. GOVERNMENT RESEARCH REPORTS

U.S. DEPARTMENT OF COMMERCE
Frederick H. Mueller, *Secretary*

BUSINESS AND DEFENSE SERVICES ADMINISTRATION
William A. White, Sr., *Administrator*

Office of Technical Services
John C. Green, *Director*

Issued monthly. Annual subscription $9 ($2.50 additional for foreign mailing). Single copy $1. Make remittance payable to Superintendent of Documents and mail either to a Department of Commerce field office or to Superintendent of Documents, U.S. Government Printing Office, Washington 25, D.C. Address changes should be sent to Superintendent of Documents.

Contents may be reprinted freely. Mention of source will be appreciated

Use of funds for printing this publication approved by the Director of the Bureau of the Budget, July 18, 1958

Printed Reports Available From OTS Announced in This Issue

ASTRONOMY — Page

Astronomical observations by means of highly sensitive electronic light intensification. Mar 60. 27p. (PB 161 729) $2.75 ... 115
Low light level performance of the intensifier orthicon. Mar 60. 19p. (PB 161 701) 50 cents ... 115

BIBLIOGRAPHY

Adhesives (supplement to CTR-300). Apr 60. 8p. (OTS SB-406) 10 cents ... 177
Bearings 1945-1960. Apr 60. 17p. (OTS SB-410) 10 cents ... 174
Corrosion (ten year bibliography). Dec 59. 39p. (OTS SB-401) 10 cents ... 203
Food preservation by irradiation (supplement to CTR-357) Mar 60. 5p. (OTS SB-403) 10 cents ... 172
Linear programming (1950-1960). Apr 60. 4p. (OTS SB-407) 10 cents ... 186
Plastics-polymer research (five year bibliography). Oct 59. 27p. (OTS SB-400) 10 cents ... 180
Rare earth elements (1940-1960). Mar 60. 20p. (OTS SB-404) 10 cents ... 129
Reliability and quality control (1950-1960). Apr 60. 9p. (OTS SB-405) 10 cents ... 159
Welding (supplement to CTR'S 324-331). Mar 60. 14p. (OTS SB-402) 10 cents ... 175
Wood (1950-1960). Apr 60. 18p. (OTS SB-408) 10 cents ... 181

BEHAVIORAL SCIENCES

Amount of information in the absolute judgement of Munsell hues. June 59. 56p. (PB 161 699) $1.50 ... 117
Prediction of advanced levels of proficiency in complex tracking task. Dec 59. 63p. (PB 161 734) $1.75 ... 121
Summary of research methods, operator characteristics, and system design specifications based on the study of a simulated radar air traffic control systems. July 59. 33p. (PB 161 741) $1.00 ... 117

BIOLOGICAL SCIENCES

Closed circuit respiration/ventilation system: Phase I. Jan 60. 111p. (PB 161 747) $2.50 ... 122
Instrumentation package for inflight physiological studies. Feb 60. 73p. (PB 161 712) $2.00 ... 124
Model 16 automatic blood pressure measuring instrument. Dec 59. 51p. (PB 161 707) $1.50 ... 125
Radiological health data. May 60. 46p. (PB 161 371-2) 50 cents, $3.00/6 mos ... 122

CHEMISTRY

Effect of cis-trans isomerism on the urea inclusion compound forming-ability of a molecule: A study of the maleate-fumarate system. Feb 60. 13p. (PB 161 730) 50 cents ... 129
Investigation of elastic and thermal properties of carbon-base bodies. Mar 60. 93p. (PB 161 733) $2.25 ... 129
New instrument for the determination of molecular weight by differential vapor pressure. Feb 60. 16p. (PB 161 711) 50 cents ... 134
Rare earth elements (1940-1960). Mar 60. 20p. (OTS SB-404) 10 cents ... 129

EARTH SCIENCES

ANALYSIS OF METHODS AND EQUIPMENT FOR MEASURING SOIL MOISTURE, by Mark D. Shaw. Rept. on Contract DA 36-039-sc-78125. Jan 60, 64p. AD-232 841.
Order from LC mi$3.90, ph$10.80 PB 146 793

An outline is presented of the textural, structural, and chemical properties of soil as well as a discussion of the following aspects of soil moisture: hygroscopic and capillary moisture, gravitational water, field capacity, permanent wilting point, moisture equivalent, and plastic and liquid limits. Descriptions are included for chemical, electrical, gravimetric, lysimetric, nuclear, penetrometric, tension, thermal, and miscellaneous methods of measuring soil moisture. The literature survey combined with test work indicates that the most promising methods available for measuring soil moisture are those based on nuclear radiation and electrical resistance. The electrical resistance method is the simpler of the two. Additional work needs to be done on the development of sensing units and measuring instruments for accurate and reliable soil moisture measurements under all conditions and at all moisture levels. The appendices include discussions on the (1) effect of fertilizer concentration, temperature, and soil type on electrical resistance soil moisture instruments [from an unpublished manuscript by Shri Mohan Gupta of the Dept. of Electrical Engineering, Univ. of Penna., 1958]; and (2) response of electrical resistance soil moisture instruments at frequencies of 20 to 20,000 c.

ASTRONOMY

Aeronautical Research Lab., Wright Air Development Div., Wright-Patterson AFB, Ohio.
ASTRONOMICAL OBSERVATIONS BY MEANS OF HIGHLY SENSITIVE ELECTRONIC LIGHT INTENSIFICATION, by Lloyd R. Wylie (Wittenberg U.), Radames K. H. Gebel, and Lee Devol. Rept. on Research on the Quantum Nature of Light. Mar 60, 27p. 31 refs. WADC Technical note 59-404.
Order from OTS $2.75 PB 161 729

The advantages of observing and photographing celestial bodies with a light amplifier that employs the closed circuit television principle are explored and treated here. Special pickup tubes were developed to insure optimum performance. The electrical signals from the pickup tube are electronically amplified and modified. The image is reproduced by a cathode ray tube and photographs may be obtained from the screen of this tube. The electronic amplification of the electrical signal permits light intensification of 10^9 times. The modification of the signal makes almost complete suppression of the background possible. It permits astronomical observations during the day and also at night that are not possible with systems in which the background cannot be suppressed. Photographs of celestial bodies taken at the Weaver Observatory of Wittenberg University are included. (Author)

[Radio Corp. of America] Princeton, N. J.
THE LOW LIGHT LEVEL PERFORMANCE OF THE INTENSIFIER ORTHICON, by G. A. Morton and J. E. Ruedy. Rept. on Contracts AF 33(616)2631 and AF 33(616)3946. Mar 60, 19p. WADD Technical note 60-20.
Order from OTS $0.50 PB 161 701

This discussion of basic principles for development of the intensifier orthicon utilizes television techniques combined with preamplification from image converter principles. Fundamental factors influencing the investigation were: ability to obtain necessary gain of additional brightness by amplification of the pickup tube signal with a conventional video amplifier, secure long integration times with background suppression and better contrast, simplicity of multiple viewing and signal measurements. Performance of the tube, related equations, diagrams and photos are included. Quantitative relationships are drawn between contrast, brightness, and image definition for one-stage intensified orthicon and wide-spaced image orthicon. Simulated astronomical objects observed by methods described in this report show the significance of the intensifier orthicon. (Author)

RADAR DETERMINATION OF THE SURFACE STRUCTURE OF THE MOON, by Fred B. Daniels. 1 Apr 60, 11p. 4 refs. USASRDL Technical rept. 2110.
Order from LC mi$2.40, ph$3.30 PB 146 937

The theory of radar reflections from a curved surface having random irregularities is developed and the application of this theory to radar echoes from the moon is discussed. The space correlation function measured at the earth's surface is found to have a similar form to that of the lunar surface, but a scale that is larger by a factor of approximately 500. Reasons are advanced for the choice of a Gaussian to represent this function, and the possibility of checking the validity of this assumption by making space diversity tests is discussed. The results of a preliminary experiment are described. (Author)

Center for Radiophysics and Space Research, Cornell U., Ithaca, N. Y.
SCIENTIFIC EXPERIMENTS FOR THE ARECIBO RADIO OBSERVATORY. Scientific rept. no. 2 on Contract AF 19(604)6158. 31 Mar 60, 64p. 29 refs. Research rept. RS 5; AFCRC-TN-60-359.
Order from LC mi$3.90, ph$10.80 PB 147 053

The feasibility of experiments inactive and passive radio astronomy is discussed. A priority list of experiments for the Arecibo Radio Observatory emerges, and the scheduling of these experiments is then discussed. Supporting theoretical and laboratory research is discussed.

Cornell U. School of Electrical Engineering, Ithaca, N. Y.
BIBLIOGRAPHY OF EXTRATERRESTRIAL RADIO NOISE. FIFTH QUARTERLY LIST OF RECENT PUBLICATIONS, by Martha Stahr Carpenter. Rept. on Contract Nonr-401(22) and NSF Grant G5964. 15 Sep 58, 21p. 177 refs. Research rept. EE 414; AD-230 622.
Order from LC mi$2.70, ph$4.80 PB 146 094

This "Fifth Quarterly List" presents references to publications dealing wholly or in part with extraterrestrial radio noise. Most of the references pertain to material received at Cornell University between June 1, 1958 and September 1, 1958. Also included are certain references to earlier publications that were not mentioned in previous "Quarterly Lists," and a few revised statements of previously listed references about which further information is now available. The types of references included and the methods of finding them have been described in the preceding reports of this series. The list of journals that are thoroughly scanned in the search for pertinent publications has recently been greatly expanded.

Cruft Lab., Harvard U., Cambridge, Mass.
EMPIRICAL BASES FOR STATIONARY TIME SERIES, I, by W. C. Kellogg. Scientific rept. no. 2 on Contract AF 19(604)4979. 5 Oct 59, 18p. 2 refs. AFCRC TN-60-214; AD-232 539.
Order from LC mi$2.40, ph$3.30 PB 146 088

A brief review is presented of some properties of orthogonal function expansions, and a method is proposed for obtaining minimal sets of basis functions for the representation of sets of signals. The design of electronic equipment that will obtain basis functions and measure expansion coefficients by an analogue computing technique is discussed. An account is given of a numerical application of the technique of obtaining basis functions to time series consisting of daily sunspot counts. (Author)

Cruft Lab., Harvard U., Cambridge, Mass.
EMPIRICAL BASES FOR STATIONARY TIME SERIES, II, by W. C. Kellogg. Scientific rept. no. 3 on Contract AF 19(604)4979. 20 Nov 59, 15p. 2 refs. AFCRC TN-60-215; AD-232 540.
Order from LC mi$2.40, ph$3.30 PB 146 089

The procedure described (PB 146 088) for constructing as basis for a set of signals from samples of the signal set is studied for the case of a single continuous signal. It is found to be applicable provided the signal is a solution of an ordinary linear homogeneous differential equation with constant coefficients. When such a signal is represented in terms of a basis of functions derived from samples of the signal, the expansion coefficients depend upon the initial times of the samples and of the section of the signal being represented, and upon the frequencies and damping factors of the signal, but not upon the amplitudes and phases of the terms containing the various frequencies. (Author)

Manchester U. (Gt. Brit.)
STUDIES IN LUNAR TOPOGRAPHY. III. ERRORS INVOLVED IN THE PHOTOGRAPHIC DETERMINATION OF HEIGHTS AND A PRELIMINARY STUDY OF THE REGION OF PTOLEMAEUS AND ALPHONSUS, by Geoffrey Turner. Technical scientific note no. 3 on Contract AF 61(052)168. June 59, 35p. 10 refs. AFCRC-TN-59-612. AD-232 271.
Order from LC mi$3.00, ph$6.30 PB 146 133

A brief recapitulation of the cine photographic method is given and the errors arising from photographic and

seeing effects together with the measuring technique are discussed. The limitations, imposed by our present inadequate knowledge of basic selenographic coordinates are described and the need for further positional measures stressed. Heights are given for the eastern ramparts of the crater Ptolemaeus and the eastern ramparts and central mountain of the crater Alphonsus. (Author) (See also PB 146 132)

Visibility Lab., U. of California, San Diego.
THEORY OF ATTENUATION MEASUREMENTS IN PLANETARY ATMOSPHERES, by Rudolph W. Preisendorfer. Rept. on Contract NObs-72092. 8 8 Dec 58, 36p. 2 refs. SIO Reference 58-81; AD-212 699.
Order from LC mi$3.00, ph$6.30 PB 147 599

Two general methods are proposed for the determination of the volume attenuation function α in arbitrarily inhomogeneous spherical atmospheres. Each method is deduced directly from the equation of transfer of general radiative transfer theory, and is designed to take into explicit account the effects of the sphericity of the earth's atmosphere on radiometric measurements at high altitudes in the atmosphere.

BEHAVIORAL SCIENCES

Human Engineering

Dunlap and Associates, Inc., [Stamford, Conn.]
TRACKING TRAINING III: TRANSFER OF TRAINING, by Charles R. Kelley, Hugh M. Bowen and others. Rept. on Contract Nonr-1908(00). 25 Jan 60, 73p. 4 refs. Technical rept. NAVTRADEVCEN 1908-00-3.
Order from LC mi$4.50, ph$12.30 PB 146 878

Field studies indicate that there is a general carryover of training from one aircraft to another which, however, does not extend to the details of control skill. Present trainers can teach procedural and instrument skills but fail to teach particular control skills. These are usually learned by actual flying. Pilot studies indicate the following: (a) Transfer between different vehicular systems is high when instruments and controls are similar. Very stable high-order tracking systems seem to the operator to respond like lower order systems. (b) Stability seems to be the most important single variable in developing tracking skill. (c) In transferring from one- to two-dimensional control, there is a high positive transfer with a stable system, and some positive transfer with an unstable system. (d) The use of a predictor display is highly effective for principles training. Laboratory experiments indicated the following: (a) Six tracking conditions varying in stability and number of control dimensions were all effective in tracking training. The most effective condition employed variable stability while the poorest condition was the criterion system which was the most unstable. (b) General tracking training produces significant increases in skill in the control of systems having widely different dynamic characteristics.

Laboratory of Aviation Psychology, Ohio State U. Research Foundation, Columbus.
THE AMOUNT OF INFORMATION IN THE ABSOLUTE JUDGMENT OF MUNSELL HUES, by Donald W. Conover. Doctoral thesis. Rept. on Contract AF 33(616)3612, continuation of Contract AF 33(616)43. June 59, 56p. 49 refs. WADC Technical note 58-262.
Order from OTS $1.50 PB 161 699

Using surface colors provided by the Munsell 50-hue series of colored papers, the author developed a preliminary equal-discriminability scale for the absolute recognition of colors. Based on these data 16 colors were selected that represented an equally spaced series. This scale was validated with a second group of subjects. The results indicated that no adjacent pair of colors was confused with much greater frequency than any other pair. Both the initial and validating data indicate that the average color-normal individual can identify, on an absolute basis, nine surface colors. For practical coding purposes these results indicate that a maximum of somewhere between five and eight colors can be used, the exact number depending on how unfavorable the viewing conditions are expected to be and how large a proportion of the population must read the code without error. Theoretical and practical aspects of the results are reviewed. (Author)

Laboratory of Aviation Psychology, Ohio State U. Research Foundation, Columbus, Ohio.
A SUMMARY OF RESEARCH METHODS, OPERATOR CHARACTERISTICS, AND SYSTEM DESIGN SPECIFICATIONS BASED ON THE STUDY OF A SIMULATED RADAR AIR TRAFFIC CONTROL SYSTEM, by J. S. Kidd. Rept. on Contract AF 33(616)3612; continuation of AF 33(616)43. July 59, 33p. 25 refs. WADC Technical rept. 59-236.
Order from OTS $1.00 PB 161 741

This report summarizes fourteen laboratory studies of human engineering aspects of radar air traffic control systems. It includes a review of methodological developments and empirical findings. Human operator characteristics consistently observed in the task setting employed are presented, along with recommendations for system design and system management based on the experimental findings. Comments regarding the future potential of this type of research in dealing with significant human factor problems are also included. (Author)

Naval Medical Research Lab., New London, Conn.
THE SHAPE OF THE NORMAL WORK AREA, by Paul C. Squires. Rept. on Project NM 002 014.08.10. 23 July 56, 7p. 3 refs. Rept. no. 275.
Order from LC mi$1.80, ph$1.80 PB 147 033

The 'normal' work area, as represented by two intersecting semicircles, found in standard texts and human engineering manuals, is incorrect. A species of epicycloid curve is proposed as the correct and desirable contour for the normal work area; the parametric equations of this curve are given, based on anthropometric data. The epicycloid contour recommended would be useful in situations where instruments and visual displays must be arranged compactly and operator movement is relatively restricted. The proposed work area contour is natural and comfortable for the operator. (Author)

Pennsylvania State U., University Park.
HUMAN ENGINEERING INVESTIGATION OF AIRCRAFT COCKPIT VISUAL DISPLAYS. THE EFFECTS OF CONTRAST COLOR, AND VIEWING ILLUMINATION ON SCALE READING, by J. Lazo, E. Hendler and others. Rept. on Contract N156s-32041. 7 Feb 57; 36p. 2 refs. TED NAM AE-7047, Pt. 16; NAMC-ACEL-324; AD-129 108.
Order from LC mi$3.00, ph$6.30 PB 146 507

The research in this report concerns the effects on the time and accuracy of scale reading of (1) the contrast of dial marks with background; (2) the color of dial marks, white vs. red on black; and (3) the level of illumination under which scale readings are made, specifically, day vs. night levels. Legibility is described as accuracy of reading in time following the definition of Fitts. Another aspect of the research is that it is based on a large number of judgments with a small number of highly practiced subjects. (See also PB 136 724)

Pennsylvania State U., University Park.
HUMAN ENGINEERING INVESTIGATION OF AIRCRAFT COCKPIT VISUAL DISPLAYS. THE EFFECTS OF CONTRAST, COLOR, AND VIEWING ILLUMINATION ON THE LEGIBILITY OF LETTERS AND NUMERALS, by Alec J. Slivinske and Lloyd M. Crumley. Rept. on Contract N156s-32041. 27 Feb 57, 15p. 3 refs. TED NAM AE-7047, Pt. 16a; NAMC-ACEL-329; AD-129 107.
Order from LC mi$2.40, ph$3.30 PB 146 505

This experiment was conducted to investigate the effects of contrast, color, and viewing illumination on the legibility of printed letters and numerals. A previous study (PB 146 507) was made of the effects of the same variables on dial-scale reading. Taken together, the two studies provide some initial data on the effectiveness of interior color and lighting of cockpits on the legibility of dials and panel displays. (See also PB 146 507)

Personnel and Training

Adjutant General's Office, Washington, D. C.
RELATIONSHIP OF AFQT TO RATED BASIC TRAINING PERFORMANCE, by A. G. Bayroff, Leonard C. Seeley, and Alan A. Anderson. Feb 60, 14p. 1 ref. PRB Technical research note 106.
Order from LC mi$2.40, ph$3.30 PB 147 055

To evaluate the effectiveness of the Armed Forces Qualification Test (AFQT) in determining mental qualification for military service and to determine its usability for screening men on differential aptitude requirements of the Army, AFQT whole and part scores of 498 enlisted men in the 8th week of basic combat training were correlated with quality of performance as rated by fellow squad members and cadre. Total AFQT score correlated .44 with mean 7-point criterion rating. Validity coefficients of AFQT subtests had a range of .30 to .40, not appreciably different from that of Army Classification Battery tests used as reference variables for this study. No basic change in AFQT content was indicated. (Author)

WHAT HUMRRO IS DOING, JULY 1948-JUNE 1959. Apr 60, 67p. 33 refs. Research Bulletin 7.
Order from LC mi$3.90, ph$10.80 PB 147 429

Using the methods of scientific research to improve the soldier's training, motivation, and leadership has been the mission of the Human Resources Research Office. The focus continues to be upon the human element amid increasingly complex instruments of war. This sixth issue of What HumRRO Is Doing reviews some of the work completed or under way during the 1959 fiscal year. It describes ways in which principles of learning have been applied to the practical problems of Army instruction, and in which experimental research techniques have contributed toward raising the soldier's proficiency and lowering the costs of his training in time and materiel. It also shows the dynamic manner in which factual data gathered during research programs may sometimes be applied successfully to practical situations while studies are still in progress.

BEHAVIORISTIC FOUNDATIONS OF UTILITY, by Patrick Suppes. Technical rept. no. 23 on Contract Nonr-225(17). 27 July 59, 29p. 18 refs. AD-225 157.
Order from LC mi$2.70, ph$4.80 PB 147 096

The extent to which behavioristic foundations can be supplied for utility is discussed. The fundamental assumptions are given of the stimulus sampling learning theory in terms of the concepts of stimulus, response, and reinforcement. This theory is then used to derive a utility function for various simple choice situations. This derived utility function is for stochastic choice behavior. The results are then related to the concept of entropy of Shannon (The Mathematical Theory of Communications. Univ. of Ill. Press, Urbana, 1949) and to the choice axiom of Luce (Individual Choice Behavior, Wiley, N. Y., 1959).

Applied Psychology Research Unit, Cambridge (Gt. Brit.).
RESEARCH ON REVERSIBLE PERCEPTION OF SPEECH SOUNDS, by Richard M. Warren. Final rept. on Contract AF 61(052)184. 30 Sep 59, 26p. 3 refs. AFOSR-TR-59-148; AD-232 057.
Order from LC mi$2.70, ph$4.80 PB 146 098

The principal findings are: (1) Verbal transformations were obtained with all the repeating experimental stimuli, varying in complexity from 2 speech sounds to complete sentences. (2) Repeating speech made indistinct by masking noise produced fewer transitions and fewer different forms than the same recording heard clearly. (3) When loudness of speech was sufficient to insure clarity, further increase in loudness seemed to have little effect on verbal transformations. (4) Repeating unfamiliar words tended to be distorted in the first (and subsequent) forms into familiar words. (5) The combined data for all words show that the rate at which words were called out was the same for each minute of the 3 min. test period. (7) Previous stimulation by a word of closely related phonetic structure was followed (even after a few days) by responses related to the previous word. Other experimental findings are reported, and the phonetic and semantic characteristics of verbal transformations are discussed. A hypothesis is suggested which considers that verbal transformations result from the application of mechanisms underlying normal speech perception to the special conditions of repeating words.

A FURTHER STUDY OF METHODS OF TRAINING FREE ASSOCIATION ORIGINALITY AND UNUSUAL USES, by Irving Maltzman, David Raskin, and Seymore Simon. Technical rept. no. 2 on Contract Nonr-233(50). Apr 59, 11p. 6 refs.
Order from LC mi$2.40, ph$3.30 PB 146 051

The purpose was to further explore possible relevant variables and alternative methods for facilitating originality. In the first experiment an attempt was made to determine whether two different methods of presenting uncommon associations to Ss would also facilitate the originality of their subsequent responses The second experiment is concerned with the effects of varying amounts of training, and was conducted as a result of some of the findings obtained in the first experiment.

Cognitive Operations Lab., Bethany Coll., [W. Va.]
CONCEPT IDENTIFICATION AS A FUNCTION OF NUMBER OF RELEVANT DIMENSIONS, by Wilbert S. Ray. Technical rept. no. 3 on Contract Nonr-2315(00). July 59, 19p. 13 refs. AD-220 051.
Order from LC mi$2.40, ph$3.30 PB 147 078

Several studies of concept formation have dealt with difficulty of acquisition as a function of the number of elements in the concept. Archer, Bourne and Brown (1955) find that difficulty increases with the number of irrelevant dimensions. Other experiments, such as those of Bruner, Goodnow and Austin (1956) and of Hovland and Weiss (1953), suggest that difficulty increases with the number of relevant dimensions, but none of these investigations has held constant the number of irrelevant dimensions. In the work reported here the number of irrelevant dimensions was held constant at zero.

ON THE INFLUENCE OF "CONGRUITY" ON THE SEARCH MECHANISM IN PROBLEM SOLVING, by Wilbert S. Ray. Technical rept. no. 2 on Contract Nonr-2315(00). July 59, 21p. 14 refs. AD-219 081.
Order from LC mi$2.70, ph$4.80 PB 147 080

The relationships which are the object of problem solving hold between 2 or more elements. Those elements which the problem solver considers first may be called congruous. Several conditions making for congruity are suggested, and 3 experiments investigating those conditions are described. The first experiment showed effects of cultural habits and of a bias produced by instructions, but failed to show any effect of visible similarity, or of familiarity with elements as occurring in pairs. The latter 2 variables appeared in a second experiment, but the first 2 disappeared. The third experiment attempted to make nonsense syllables similar by giving them similar meanings, and then transferred these syllables to an apparatus task to see whether the meanings would affect the order in which Ss used the switches of the apparatus. They did not do so. (Author)

INTERPERSONAL PRECEPTION AND INTERPERSONAL RELATIONSHIPS IN THERAPEUTIC COUNSELING, by J. McV. Hunt. Annual rept. no. 1 on Contract Nonr-1834(11). 15 Nov 57, 50p. 14 refs. AD-150 620.
Order from LC mi$3.30, ph$7.80 PB 137 981

The first section describes an analysis of the interpersonal preception scores obtained from the clients and counselors in the program of research on therapeutic counseling at the University of Illinois and an initial attempt to relate them to various measures of outcome in a test of their promise for use in further investigation. The second section describes the results of the factor analysis of the items of the Ewing Personal Rating Form. The third section is a working paper which outlines the results of this test of the independence of interpersonal perception scores of the content of descriptive items. It also presents a mathematical break-down of one of these scores, and tests the meaning of the components on a highly exploratory basis with two factors in 10 cases.

AN ASSOCIATIVE FACTOR IN THE CONSTRUCTION OF SENTENCES, by Charles N. Cofer. Technical rept. no. 25 on Learning, Retention and Recovery of Meaningful Material, Contract Nonr-595(04). July 59, 8p. 4 refs. AD-220 521.
Order from LC mi$1.80, ph$1.80 PB 147 071

Subjects were asked to choose one of two words to go with another word (A-word) in a sentence. It was hypothesized that choice would favor the one of the two words which was a higher associate, according to free association norms, of the A-word. The over-all results did not conform to this expectation. Analyses of items whose results did fit this expectation and of items which did not was carried out. Among the positive items, the high-frequency response to the A-word was also found (in the norms) to elicit the A-word as a frequent associate. In the negative instances, either both of the A-word associates or its less frequent associate elicited the A-word as an associate, according to the norms. Although the associative data are too scarce to permit a confident generalization, these findings suggest the significance of bidirectional associations in a choice situation of this kind. It was also pointed out that paradigmatic and syntamatic relations among the words are probably factors in choice. (Author)

Maryland U., College Park.
AN EXPLORATION OF CLUSTERING IN THE RECALL OF NOUNS EMBEDDED DURING PRESENTATION IN SENTENCES, by Charles N. Cofer and Erwin Segal. Technical rept. no. 27 on Learning, Retention and Recovery of Meaningful Materials, Contract Nonr-595(04). July 59, 7p. 6 refs. AD-220 523.
Order from LC mi$1.80, ph$1.80 PB 147 074

A procedure is described for studying the effect of a sentence context on clustering in nouns. Twenty-four nouns were selected, 6 from each of 4 categories: occupations, articles of clothing, articles of furniture, and 4-footed animals. The six nouns for each category were selected from those which, according to the norms of Cohen, Bousfield, and Whitmarsh (Psychol. Rep. 4:39-44, 1958), were frequent associates to the category names. Six sentences were made up, all having very similar structures, and each sentence contained one noun from each of the 4 categories. The sentences were to the subjects of the experimental group. In order to provide control data for the recall of the nouns from the sentences, the 24 nouns were formed into 2 lists. In one the sequence of nouns was random, and in the other it was the same as it was in the sentences. An experiment was conducted to try this method. Findings indicated that recall of words is significantly impaired in the sentence condition at both immediate and delayed recalls. (See also AD-220 521, AD-220 522)

Maryland U., College Park.
CERTAIN MODIFIER EFFECTS WITH NOUNS VARYING IN DEGREE OF CLUSTERING TENDENCY by Charles N. Cofer and Erwin Segal. Technical rept. no. 29 on Learning, Retention and Recovery of Meaningful Materials, Contract Nonr-595(04). July 59, 8p. 6 refs. AD-220 525.
Order from LC mi$1.80, ph$1.80 PB 147 072

Two experiments are described. The purpose of the first experiment was to determine whether inappropriate modification would affect the recall and clustering of strongly clustering nouns to an extent greater than it would effect these measures in weakly clustering nouns. The second experiment also examined the effects on strongly and weakly clustering nouns of a variable found in previous studies to reduce recall and clustering. This variable is the specificity with which adjectives modify their nouns. Results indicated that the specificity adjectives, like the inappropriate ones, tend to reduce clustering and recall in strongly clustering nouns, although the effects are not as great as expected. The weakly clustering nouns were affected less by the specificity effect than were the strongly clustering nouns. The effects of inappropriate modification were greatest in the strongly clustering words, which was contrary to expectations.

Maryland U., College Park.
INAPPROPRIATE MODIFICATION OF NOUNS IN A FACILITATION DESIGN, by C. N. Cofer and Erwin Segal. Technical rept. no. 28 on Learning, Retention and Recovery of Meaningful Materials, Contract Nonr-595(04). July 59, 6p. 6 refs. AD-220 524.
Order from LC mi$1.80, ph$1.80 PB 147 073

The present study investigates the possibility that the effects of inappropriate modification might be offset to some extent if inappropriate modification could be accomplished in the facilitation design.

Michigan U., Ann Arbor.
ATTITUDE CHANGE PROJECT. Annual rept. for 15 Nov 57-31 Jan 58 on Contract Nonr-1224(10). 1 Feb 58, 6p.
Order from LC mi$1.80, ph$1.80 PB 137 804

A theory on the relation of structure to perception has been sketched; experimental studies of opposites structure have been continued; and an investigation of attitude change and the generalization of that change within a structure based on associative linkages has been carried out.

[Northwestern U., Evanston, Ill.]
FACTORS INFLUENCING THE LEARNING AND RETENTION OF VERBAL MATERIALS, by Benton J. Underwood. Final rept. on Contract N7onr-450(08). 6 July 59, 3p. 26 refs.
Order from LC mi$1.80, ph$1.80 PB 147 081

The results of studies dealing with the effect of intertrial interval and interacting variables have been published as a series in the Journal of Experimental Psychology. Work on distributed practice led to problems not directly associated with the role of distribution. Publications are listed which represent efforts on these problems.

Psychological Research Associates, Arlington, Va.
PREDICTION OF ADVANCED LEVELS OF PROFICIENCY IN A COMPLEX TRACKING TASK, by James F. Parker, Jr. and Edwin A. Fleishman (Yale U.). Rept. on Human Factors in the Design of Training Equipment, Contract AF 41(657)64. Dec 59, 63p. 23 refs. WADC Technical rept. 59-255.
Order from OTS $1.75 PB 161 734

Two hundred three Air Force ROTC subjects were administered a large battery of printed and apparatus psychomotor reference tests from which 50 scores were taken. Following administration of the reference tests, subjects devoted 17 sessions distributed over a six-week period to practice on a complex tracking task. The matrix of intercorrelations among these scores was factor analyzed and 15 ability factors identified. An analysis then was conducted of the extent to which variation in performance in tracking at the different stages of practice could be accounted for in terms of the identified ability factors. The ability factors accounted for in terms of the identified ability factors. The ability factors accounted for only a small portion of the variance in tracking performance. Hypotheses are offered concerning the selection of a different set of reference measures which might be more effective. The analyses of these data do indicate, however, that the prediction of terminal tracking proficiency is better accomplished through a set of external measures than through initial scores taken directly from the tracking task. Early proficiency on the task itself was unrelated to terminal proficiency. (Author)

Research Center for Human Relations, New York U., N. Y.
GROUP EFFECTS ON TENSION PATTERNS AND MOTIVATION, by Murray Horwitz. Technical rept. no. 1 on Contract Nonr-285(28). Apr 59, 18p. 2 refs. AD-218 364.
Order from LC mi$2.40, ph$3.30 PB 146 049

The experiment described here is designed (a) to engage S in unpleasant tasks, (b) to induce social pressures upon S to deny his aversive feelings, (c) to examine effects upon muscle tensions. The results are reported in two parts: (a) evidence as to how well the experimental manipulations "took"; (b) effects on tensional activity.

Rutgers State U., New Brunswick, N. J.
HOMEOSTASIS THEORY OF SMALL GROUPS, by F. K. Berrien and William H. Angoff. Technical rept. on Contract Nonr-404(10). Dec 57, 26p. 1 ref.
Order from LC mi$2.70, ph$4.80 PB 137 996

The purpose of this research program is to test the usefulness of the concepts of homeostasis and equilibrium as they may be applied to small group phenomena. A detailed statement of the theory and pertinent literature bearing upon it is summarized. (See also PB 142 092)

Washington U., Seattle.
THE PREDICTION OF COLLEGE SUCCESS FROM BIOGRAPHICAL DATA AND SELF-RATINGS, by Wolf-Ulrich J. Hebenstreit. Rept. on Contract Nonr-477(08) and Public Health Research Grant M-743(C3) July 59, 40p. 16 refs. AD-220 239.
Order from LC mi$3.00, ph$6.30 PB 147 098

An attempt was made to determine whether items from the Personality Data Inventory (PDI) would correlate with the obtained Grade Point Average (GPA), and to determine the effect on scale validity of adding items of progressively decreasing item validity. Results indicated that 10 of the 33 items selected by the judges as probably predictive of GPA were found to be significantly correlated with GPA. The addition of less valid items did not have the expected effect; i.e., there was no evidence that the original validity coefficients has been spuriously high because of capitalizing on chance differences in the original sample.

Washington U., Seattle.
PRELIMINARY STEPS IN THE CONSTRUCTION OF FACTOR SCALES FOR THE MMPI, by Hayden LeRoy Mees. Rept. on Contracts Nonr-477(08) and Public Health Research Grant M-743(C3). July 59, 120p. 19 refs. AD-219 936.
Order from LC mi$6.00, ph$18.30 PB 147 090

A study is presented of the problems considered preliminary to the construction of factor scales for the Minnesota Multiphasic Personality Inventory (MMPI). These problems are: (1) finding the dimensionality of a selected set of MMPI items, (2) determining the degree to which these dimensions are similar when the items are used with 2 different populations of subjects, and (3) investigating the relationship between the items

and the dimensions. The results are cited as evidence for the relative invariance and psychological meaningfulness of these 3 factors: (1) a general complaint factor described in terms of serious psychopathology and denoting socially undesirable characteristics, (2) a regressive factor which measures denial of aggressiveness, and (3) factors related to feminine interest patterns. The similarity to results of factor analyses affirms the usefulness and adequacy of the methods used. The approach also provides information about the MMPI items which are directly applicable to the construction of the factor scales.

Willow Run Labs., U. of Michigan, Ann Arbor.
A STUDY OF DECISION MAKING UNDER RISK, by C. H. Coombs and D. G. Pruitt. Rept. on Project Michigan, Contract DA 36-039-sc-78801. Apr 60, 31p. 12 refs. 2900-33-T.
Order from LC mi$3.00, ph$6.30 PB 147 001

The importance of the human being in man-machine systems has made it necessary to study man as he functions in these systems, particularly to determine whether individuals possess any characteristic attitudes that would influence their decisions in risky situations. The present experiment has produced a theory which revises the theory of maximization of expected utility--i.e., that someone faced with alternative gambles will make the choice yielding the maximum average payoff. The revision of this theory suggests that, while he will always prefer more expectation (other things being equal), an individual may have a utility for risk which will exhibit itself as a preference for certain amounts of variance and skewness. The results of this experiment show that for the best results the desirable risk-taking characteristics of an individual should be known and squared with the system in which he operates. If a computer is designed to replace an individual in a decision-making role, the desired risk-taking characteristics must be built into its decision-making component. (Author)

Army Chemical Corps, Fort Detrick, Md.
USE OF ULTRAVIOLET RADIATION IN MICROBIOLOGICAL LABORATORIES, by G. Briggs Phillips and Everett Hanel, Jr. Nov 59, 391p. 328 refs.
Order from LC mi$11.10, ph$60.60 PB 147 043

The investigational program which is reported here was established because it was desirable first to survey the literature concerning the action and use of UV radiation, and second, to determine experimentally the susceptibility of various types of microorganisms when exposed to radiation under conditions that might be found in the infectious disease laboratory. Finally it was planned to use the assembled data as a guide in developing, designing and testing suitable UV installations for use in the infectious disease laboratory. Germicidal UV radiation is used in industry for protection of personnel and protection of the product. Its uses in this report have been directed primarily toward protection of personnel and test animals.

CLOSED CIRCUIT RESPIRATION/VENTILATION SYSTEM: PHASE 1. Rept. on Contract AF 33(616)3856. Jan 60, 111p. 61 refs. WADD Technical rept. 60-33.
Order from OTS $2.50 PB 161 747

A literature survey was conducted to determine the physiological requirements of a man supported in an artificial atmosphere. Concurrently, a study was made of the environmental considerations which, combined with the physiological requirements, defined the desired characteristics of a closed circuit respiration/ventilation system. A closed circuit respiration/ventilation system was designed to support a man on a hypothetical twelve hour mission. The design, fabrication, and testing of each component are treated separately and limited results of tests of the assembled system are included. (Author)

CHANGES IN TESTICULAR CHOLESTEROL IN THE SEMICRYPTORCHID AND SEMICASTRATE RAT, by Roger A. Hoffman, Mar 60, 11p. 7 refs. CWLR-2379.
Order from LC mi$2.40, ph$3.30 PB 147 331

Following unilateral cryptorchidism, cholesterol concentration and total amount in the testes undergo rapid changes. After 16 days the scrotal testis maintains normal levels while the abdominal testis shows a gradual decline. No difference was found in the scrotal testis and the remaining testis of the partially castrated rat, suggesting that these two conditions are comparable in so far as gonad cholesterol is concerned. The data suggest that rapid changes in FSH secretion occur following cryptorchidism and that the presence and functional integrity of the advanced germinal elements of the testicular tubules act to regulate pituitary gonadotrophin secretion. (Author)

THE EFFECT OF OXYGEN DEPRIVATION ON THE X-WAVE AND B-WAVE OF THE HUMAN ELECTRORETINOGRAM, by J. H. Hill. Rept. no. 13 on Task MR005.13-6002.1. 29 Mar 60, 77p. 40 refs. NADC-MA-6008.
Order from LC mi$4.50, ph$12.30 PB 146 899

The object of this investigation was to determine the effects of oxygen deprivation on the X-wave and the B-wave of the human electroretinogram. The electroretinograms were elicited by ten-second bursts of four-per-second flashes or three-second bursts of twenty-per second flashes of dark red, light red, green, or blue light at three levels of intensity. A burst of flashes was presented at one-minute intervals while the observer breathed air for 12 minutes, a nine per cent oxygen gas mixture for thirty minutes and then air again for twenty minutes. In all, electroretinograms were elicited and recorded in 18 such experimental sessions with two observers. Records obtained from the two observers showed that the amplitude of the X-waves elicited by dark red, light red, green, or blue light at four flashes per second and at twenty flashes per second was reduced when the observer breathed the oxygen-poor gas mixture. The reduction in X-wave amplitude was not found to vary with the spectral composition of the stimulus, but was found to be proportional to the amplitude of the waveform elicited in the initial air-breathing period. The amplitude of the B-wave elicited by the stimuli at four flashes per second was reduced to a lesser extent than the X-wave. When the losses in photopic and scotopic visual sensitivities were estimated from losses in amplitude of the X-wave and the B-wave respectively, the difference between the estimates was found to be insignificant. The relation of these finds to those of previous investigations is discussed. (Author)

Aviation Medical Acceleration Lab., Naval Air Development Center, Johnsville, Pa.
THE EFFECTS OF MODERATE AND LOW LUMINANCES AND VARIOUS DURATIONS OF PRE-EXPOSURE ON DARK ADAPTATION, by Dorothy E. Fletcher. Rept. no. 3 on Project NM 001 110 300. 2 May 57, 36p. 10 refs. NADC-MA-5706; AD-134 621.
Order from LC mi$3.00, ph$6.30 PB 147 585

Monocular dark adaptation data for two observers were obtained with the Hecht-Shlaer adaptometer, fitted with a 2-mm diameter artificial pupil, as absolute thresholds taken by ascending series of the method of limits. After 30 minutes in the dark, the pre-exposure was presented at a luminance of from 0.000608 to 971 millilamberts (mL) and at a duration of from 0.01 to 20 minutes. The white+pre-exposure field was 35° in diameter, centered 10° nasally. The test field was green, 1° in diameter, 10° nasal in retinal location, and 0.02 second in duration. Single-limbed curves described data taken after pre-exposures of from -1.15 to 2.69 log mL-min for one observer and from -1.92 to 2.99 log mL-min for the other. As the product of pre-exposure luminance and duration increased over this range, the dark adaptation curves decreased in acceleration and increased in extent on the time axis and on the log threshold luminance axis. Similar but less extensive and less reliable effects were produced by increasing pre-exposure duration. (Author)

Aviation Medical Acceleration Laboratory, Naval Air Development Center, Johnsville, Pa.
PRELIMINARY STUDY OF DAMPING OF THE OTOLITH ORGAN SYSTEM BY EPICYCLIC ROTATION, by R. F. Gray and D. M. Morway. Rept. no. 10 on Task MR 005.13-6002-1, formerly NM 17 01 12.1. 28 Dec 59, 9p. TED ADC AE-1412; NADC-MA-5919; AD-231 600.
Order from LC mi$1.80, ph$1.80 PB 146 203

An attempt was made to determine the basic validity of the concept that the effects of gravity on the otolith organs can be eliminated by tumbling humans around a horizontal axis through the head. The method of testing this concept was to generate oculogravic illusions in subjects on the centrifuge by letting the direction of the resultant of centrifugal acceleration and gravity change in direction through the man so that his perceived vertical would change. Four subjects were tumbled in the plane of rotation of the centrifuge around a true vertical axis. Results indicated that tumbling does reduce the apparent tilt of the oculogravic illusion generated on a centrifuge. The rate of 30 rpm was not sufficiently high to completely eliminate these illusions. The few seconds at 30 rpm noted as being without oculogravic illusions suggested that a higher tumbling frequency may eliminate these illusions.

George Washington U. School of Medicine, Washington, D. C.
EFFECT OF LIPOTROPIC FACTORS ON COLD PHYSIOLOGY. III. KETONE BODY LEVELS IN THE COLD, by Carleton R. Treadwell. Rept. on Contract AF 18(600)463. Sep 57, 18p. 4 refs. Technical note AAL-TN-57-25; AD-230 835.
Order from LC mi$2.40, ph$3.30 PB 146 241

The effects of protein, fat, and carbohydrate contents of the diet on fat metabolism and especially on the development of ketosis in the cold, including the relation of age, sex, previous diet, and duration of exposure to cold, were investigated. Results indicated that cold is an effective lipotropic agent. No demonstrable requirements were found for lipotropic factors in the cold in rats receiving diets containing up to 40% fat. The principal effect of cold on the lipids of the liver, blood, adrenals, and kidneys was to produce a marked decrease (to normal levels) in the neutral fat fraction. Cold, over a 3-wk period, did not lower the

free or ester cholesterol content of the adrenals, indicating a later adjustment of the animals to the immediate stress of cold. Animals in the cold on high-fat diets can utilize large amounts of fat without a metabolic ketosis. In changing from a low-fat diet to a high-fat diet an immediate response of an increase in the blood lipid fractions was observed both at 25° and at 10°C. During the 3-wk period there is a gradual return to control levels at both temperatures. Animals at 10°C metabolize large amounts of fat without an increase in blood lipids over the levels of comparable animals at 25°C. The data on ketosis in the cold suggests that previous reports of metabolic ketosis were caused by an actual or relative deficiency of calories. (See also PB 146 243)

SOME METHODOLOGICAL CONSIDERATIONS IN MEASURING VISUAL THRESHOLDS FOR VELOCITY, by R. H. Brown. Interim rept. 21 Apr 60, 14p. 49 refs. NRL rept. 5477.
Order from LC mi$2.40, ph$3.30 PB 145 719

Theoretical analysis and review of literature data indicated the utility of three assumptions: first, that the distribution of responses reported in different experiments as a function of speed involved the effects of random variables; second, that the distribution function of speed in logarithmic units is normal, which assumption was supported by an analysis involving the Bunsen-Roscoe law of photochemistry and by plotting the frequency of velocity discriminations on log probability paper; and third, that the logarithmic-normal distribution function of speed provides for homogeneity of variance when an additional variable is introduced. The third assumption was supported by the conclusion from a review of a group of experiments involving different bivariate distributions of velocity discrimination as a function of field dimensions, luminance, speed during comparative judgments, and mode of observation that the standard deviation is proportioned to the mean of the distributions in speed. INSTRUMENTATION PACKAGE FOR INFLIGHT PHYSIOLOGICAL STUDIES, by M. N. Goldberg, R. A. Mills, and W. V. Blockley. Final rept. on Physiology of Flight, Contract AF 33(616)5866. Feb 60, 73p. WADD Technical rept. 60-83.
Order from OTS $2.00 PB 161 712

An instrumentation package has been developed for the monitoring of pilot physiological status during flights in the X-15. Data recorded include electrocardiograph signals, respiratory flow rates, skin and deep body temperatures, and helmet-suit and suit-cockpit pressure differentials. Environmental and flight tests were performed to determine the characteristics of the package and to survey subject response during stress. The package is capable of driving a pulse duration modulation (PDM) system for telemetering pressure data. Descriptions of the components and method of use are included. (Author)

CHANGES IN FOOT VOLUME AND CAPILLARY FRAGILITY DURING CONTINUOUS COLD EXPOSURE AND STARVATION, by Paul S. Norman, Marlin B. Kreider, and P. F. Iampietro. Apr 60, 11p. 13 refs. Technical rept. EP-132.
Order from LC mi$2.40, ph$3.30 PB 146 905

The effects of continuous cold exposure (2 weeks at 60°F) and starvation on foot volume and capillary fragility were studied in 6 men. The experimental period was preceded and followed by 2-week periods (Control and Recovery) at 80°F and a caloric intake of 2,400 calories. Foot volumes decreased 6.1 percent in the first 5 hours of cold exposure and remained constant for the remainder of the experimental period. Foot volume was also measured after 3 minutes of elevation of the foot and occlusion of the blood supply. This volume decreased less during the experimental than the preceding or following periods. Capillary fragility decreased slowly during the experimental period and increased in the recovery period. On the third day of recovery, foot volumes were larger than at any other time. For the remainder of recovery, foot volume was the same as the control volume, but there was a greater decrease in volume with foot elevation. The results suggest that there was a constriction of all types of blood vessels during the experimental period, while in the recovery period there was apparently a simultaneous dilatation of large blood vessels and a constriction of small ones. One subject had a greatly increased volume of one foot, associated with pain and redness during early recovery days. These changes may be indicative of early trench foot or capillary damage. Starvation per se appeared to have no effect on foot volume. (Author)

EFFECTS OF HIGH AND LOW HUMIDITY ON HEAT EXCHANGES OF LIGHTLY CLOTHED MEN, by P. F. Iampietro, E. R. Buskirk, and J. A. Vaughan. Apr 60. 10p. 4 refs. Technical rept. EP-131.
Order from LC mi$1.80, ph$1.80 PB 146 904

Six healthy young men were exposed, lightly clothed, to various combinations of wind (<1 and 10 mph), temperature (40 and 50°F) and relative humidity (30 and 100%). Skin and rectal temperatures and oxygen consumption were recorded. The results show that relative humidity had no effect on the physiological responses measured, whereas wind and dry bulb temperature had marked effects. This follows the pattern seen when men were exposed without clothing, and indicates that, under chamber conditions, there is little interaction between clothing and humidity that could account for cold-wet "chill". The importance of considering radiation in any comparison of cold-wet and cold-dry environments is discussed. (Author)

MODEL 16 AUTOMATIC BLOOD PRESSURE MEASURING INSTRUMENT, by Richard A. Johnson. Rept. on Physiology of Flight, Contract AF 33(616)5829. Dec 59, 51p. Research rept. 16-4F; WADC Technical rept. 59-429.
Order from OTS $1.50 PB 161 707

An Automatic Blood Pressure Measuring System for detecting and measuring the arterial diastolic and systolic pressures of a human has been developed. The purpose of this system is to provide physiological information about an individual while he is being subjected to varying conditions of environment and stress. The system is unique in that it uses transistor logic for performing the program functions. It is housed in a compact, portable case and is equipped with a carrying handle. The range of operation is from 100 to 200 mm. of mercury, and the measurement can be automatically repeated at intervals varying from 1 to 15 minutes. (Author)

THE EFFECT OF ADRENALECTOMY ON ALBUMIN-PALMITATE-1-C^{14} OXIDATION, by E. J. Masoro, M. D. Valentine, and J. M. Felts. Rept. on Contract AF 41(657)145 and Public Health Research Grant RG 4989. June 58, 11p. 17 refs. Technical note AAL-TN-58-6.
Order from LC mi$2.40, ph$3.30 PB 147 291

The oxidation of albumin-palmitate-1-C^{14} (NEFA) to $C^{14}O_2$ was studied in sham-operated and adrenalectomized rats fasted for 12-18 hours. The $C^{14}O_2$ yield was approximately the same in both animal groups. The conclusion is drawn that the ability of the rat tissues to oxidize long-chain fatty acids is not affected by adrenalectomy. It was found that the $C^{14}O_2$ production from the albumin-palmitate complex is not related either to the size of the animal or to the endogenous metabolism, as shown by the total CO_2 production. COMPARATIVE HISTOLOGICAL STUDIES OF THE DIGESTIVE TRACT OF WARM AND ACTIVE AND HIBERNATING ARCTIC GROUND SQUIRRELS, by Sol Bernick and William V. Mayer (Arctic Aeromedical Lab.). Rept. on Contract AF 18(600)843. Sep 58, 13p. 7 refs. Technical note AAL-TN-58-28.
Order from LC mi$2.40, ph$3.30 PB 147 287

As hibernation progresses there is a decrease in both number and activity of the parietal and chief cells of the stomach. During hibernation mitoses in the crypts of Lieberkühn of the small intestine are reduced and are not demonstrable after 3 weeks of hibernation. During this same period the staining property of the Paneth cells is likewise reduced. The colon exhibits a reduction in the mucous of the goblet cells during hibernation. All regions of the digestive tract investigated were essentially normal 24 hours after awakening from hibernation.

ENZYME ACTIVITY IN HUMAN LIVER, by Leon Schiff and James F. O'Donnell. Rept. for 1 Mar 58-15 Feb 59 on Contract DA 49-007-MD-882. 20 Feb 59, 9p. 10 refs. AD-211 137.
Order from LC mi$1.80, ph$1.80 PB 146 010

Human liver tissue specimens have been obtained at surgery or in some instances at autopsy as soon after death as possible. The acid-soluble fractions of 16 of these liver specimens have been prepared and column chromatography carried out to analyze for the nucleotide components. It has been found that characteristically the triphosphorylated nucleotides are diminished in patients with hepatitis and cirrhosis and in some cases of carcinoma of the liver. Levels of the enzyme ATPase are also being determined on liver specimens and from the five cases studied to date there appears to be increased activity in patients with liver disease. These data fit well with the theory that in liver disease uncoupling of oxidative phosphorylation results in increased levels of ATPase and consequent lowering of the ATP content of liver. (Author)

EFFECTS OF CORTICOTROPIN ON EXCRETION RESPONSES OF RATS ACCLIMATED TO VARIOUS ENVIRONMENTS, by Henry B. Hale and Roy B. Mefferd, Jr. Aug 59, 27p. 18 refs. Rept. 59-81; AD-229 895.
Order from LC mi$2.70, ph$4.80 PB 146 148

The effects of corticotropin (ACTH) in low dosage on metabolic responses of male rats acclimated to cold, neutral, or hot environments or to low barometric pressure were determined. Determinations included urinary Na, K, Ca, P, Mg, urea, uric acid, creatinine; creatine, taurine, β-alanine, glycine, α-alanine, valine, methionine, serine, threonine, tyrosine, glutamic acid, aspartic acid, lysine, arginine, histidine, glucose, glucuronic acid, phenolic acids, and coproporphyrin. Fecal determinations were made for coproporphyrin, protoporphyrin, and deuteroporphyrin. The metabolic responses studied were those which occurred when the differently acclimated groups of rats were exposed to adverse conditions other than those to which they were acclimated. ACTH augmented certain responses and diminished others. There were some metabolic responses which which were unaffected by ACTH. Environmentally nonspecific effects were identified among these results, and a comparison was made between two strains of rats. (Author)

STRUCTURE AND FUNCTION OF CHYLOMICRONS, by Roy H. Turner. Rept. for 1 Sep 50-28 Feb 59 on Contract DA 49-007-md-79. [1958] 23p. 6 refs. AD-212 296.
Order from LC mi$2.70, ph$4.80 PB 146 825

This report summarizes studies of serum lipids, with particular reference to several physiological and pathological influences which modify lipids in the ultracentrifugal fraction of minimum density, (FMD), with respect to its quantity and quality, as described by statistical methods. The results of the studies reported support the hypothesis that large concentrations of triglyceride in postabsorptive serum of humans may reflect one of the metabolic peculiarities which predispose individuals to development of atherosclerosis, and that the predisposition is greater when the fat is carried by beta lipoprotein then when carried by alpha,

Moore School of Electrical Engineering, U. of Pennsylvania, Philadelphia.
THE ELECTRICAL CONDUCTANCE AND DIELECTRIC CONSTANT OF THE INTERIOR OF ERYTHROCYTES, by H. Pauly and H. P. Schwan. Technical rept. no. 28 on Contract Nonr-551(05). [1958] 84p. 56 refs. AD-219 122.
Order from LC mi$4.80, ph$13.80 PB 147 059

The impedance of erythrocytes of man, beef, sheep, dog, cat, rabbit, and chicken was measured in the range from 0.5 to 250 Mc. The electrical conductance of the interior of the red blood cells was measured between 70 and 100 Mc. The values differ from species to species within the rather limited range from 4.4 to 5.3 mMho/cm. The theoretical value, calculated on the basis of the salt content of the cell, its ion mobility and the volume concentration of hemoglobin, is roughly twice as large as the measured value. As yet there is no quantitative explanation for this discrepancy. This discrepancy is not a typical property of the living red blood cell. After removal of the cell interior into a highly concentrated hemoglobin solution, the conductivity is practically unchanged. This leads to the conclusion that the cell interior behaves -- from an electrical point of view -- like a highly concentrated hemoglobin solution. (Author)

Moore School of Electrical Engineering, U. of Pennsylvania, Philadelphia.
THE ELECTRICAL PROPERTIES OF THE MITOCHONDRIAL MEMBRANE, by Helmut Pauly, Lester Packer, and H. P. Schwan. Technical rept. no. 29 on Contract Nonr-551(05) and Public Health Service USPH-1253(C6). [1959] 43p. 31 refs.
Order from LC mi$3.30, ph$7.80 PB 147 060

The electrical capacity of the membrane of rat liver mitochondria is 0.5 to 0.6 μ farad/cm^2. This membrane capacity is obtained from the analysis of the frequency dependence of the admittance of a suspension of swollen mitochondria. In potassium chloride media the mitochondrial membrane capacity does not depend on the ion concentration. The internal conductance of the mitochondria was approximately two times lower than that of the external medium; the same applies if the mitochondria are equilibrated in a medium with a 10-fold difference in potassium chloride concentration. Hence the swollen mitochondria investigated here appear to be able to adjust their internal ion concentration in proportion with that of the external phase. The similarity of the membrane capacity of isolated mitochondria with the range of values

known for other membranes suggests a common molecular structure. The analysis of experimental data suggests an unisotropic electrical behavior of the interior of mitochondria. This unisotropy is readily explained by the existence of internal membranes. (Author)

Moore School of Electrical Engineering, U. of Pennsylvania, Philadelphia.
THE RELATIONSHIP OF INTERNAL CONDUCTANCE AND MEMBRANE CAPACITY TO MITOCHONDRIAL VOLUME, by Helmut Pauly and Lester Packer. Technical rept. no. 30 on Contracts Nonr-551(05) and USPH-1253(C6). [1959] 37p. 31 refs.
Order from LC mi$3.00, ph$6.30 PB 147 061

A study was made of the effect of mitochondrial size on the electrical properties of the membrane and the internal conductivity of mitochondria. The dielectric constant and electrical conductivity of suspensions of guinea pig heart mitochondria were examined in the frequency range 5×10^5 to 2.5×10^8 cps. Membrane capacity was calculated to be 1.1 - 1.3 μ Farad/cm^2 and was virtually the same in mitochondria whose surface area was made to vary by a factor of 4 by osmotic means. This finding suggested that some mechanism must exist for the transfer of mitochondrial material into membrane structure during fluctuations in mitochondrial size. The electrical capacity of the membrane was unaffected by a 33-fold change in potassium chloride concentration. The internal conductance of swollen mitochondria was 2-3 times lower than that of the external medium. In contracted mitochondria the internal conductance was virtually independent of the conductivity of the external medium. These results were discussed in relation to current concepts of mitochondrial structure. (Author)

POROUS METAL MOLDS. PART I, by M. J. Fletcher and Fred Whisenhunt. 26 Mar 58, 9p. Technical rept. 5807; AD-160 649.
Order from LC mi$1.80, ph$1.80 PB 145 965

In line with current efforts to obtain a durable, efficient, porous mold for casting latex films, the first attempt has been made to produce a porous metal mold. In general, porous metals have been attained by three means: Powder metallurgy, leaching and plating. This first study has been conducted with brass plating for the leaching operation.

Aviation Medical Acceleration Lab., Naval Air Development Center, Johnsville, Pa.
DESIGN AND CONSTRUCTION OF PHYSIOLOGICAL ELECTRONIC SYSTEMS USING OPERATIONAL AMPLIFIERS, by Freeman W. Cope. Rept. no. 9 on Task MR005.15-0002.7. 7 Apr 60, 9p. 4 refs. Proj. TED ADC AE RS-7045; NADC-MA-6010.
Order from LC mi$1.80, ph$1.80 PB 146 898

The use of operational amplifiers allows the construction of a great variety of physiological electronic systems at minimum cost and with a minimum knowledge of electronics design and with minimum expenditure of time. An operational amplifier in conjunction with 2 or 3 external plug-in resistors or capacitances may be used as a D. C. amplifier, an integrator, or a differentiator. Many more complicated physiological electronics systems may be designed and constructed with comparable ease and at modest cost using operational amplifiers. (Author)

STUDIES IN WOUND BALLISTICS: TEMPORARY CAVITIES AND PERMANENT TRACTS PRODUCED BY HIGH-VELOCITY PROJECTILES IN GELATIN, by Mas Krauss and John F. Miller. Feb 60, 30p. 11 refs. CWLR-2340; AD-233 840
Order from LC mi$2.70, ph$4.80 PB 146 863

In the present experiments, caliber .30 and caliber .22 bullets, caliber .30 fragment simulators, and 1/4-in. steel spheres were fired into cylinders of 20% gelatin, some of which were confined in rigid plasticized fiberglass casings. A simple method for approximating the cross-sectional dimensions of the temporary cavity from the cross-sectional dimensions of the permanent missile path in 20% gelatin is described. Experiments with confined gelatin cylinders showed that the temporary cavity can be almost completely suppressed by external constraint of the gelatin. It was shown that energy absorption and momentum transfer in 20% gelatin are independent of temporary-cavity formation. Implications of these findings are discussed. (Author)

University of Southern California, Los Angeles,
THE EFFECTS OF STAGNANT ANOXIA ON THE CAPILLARY CIRCULATION, by Chester Hyman, Sheldon Rosenfeld and others. Rept. on Contract W33-038-ac-19062. Oct 49, 32p. 9 refs. AF Technical rept. no. 5974; ATI-69 292.
Order from LC mi$3.00, ph$6.30 PB 147 385

Based on the present studies, as well as a review of the literature, there is reason to believe that the blood vessels in mammalian muscle and skin are capable of enduring periods of stagnant anoxia in excess of one hour with minimal residual damage. The present studies call attention to the transient alteration in normal fluid equilibrium which occurs during the period of reactive hyperemia, and which results in a limited amount of edema formation. ROLE OF SOLVENTS IN PENETRATION OF SKIN BY CHEMICAL AGENTS. I. METHOD OF COLLECTION AND CHARACTERIZATION OF HUMAN SKIN LIPIDS, by James E. Tingstad, Dale E. Wurster, and Takeru Higuchi. Rept. on Contract DA 18-108-CML-5753. [1956] 67p. 63 refs. CWL Technical Memo. 27-8.
Order from LC mi$3.90, ph$10.80 PB 146 830

A procedure has been developed to collect and characterize skin lipids on a substantial scale. Chemical data obtained on the material collected indicate that the nature of the lipids was relatively insensitive to the exact collection method but appeared to vary markedly from donor to donor and quite significantly with season. Evidence is presented which indicate that the collected material actually represent the products of the sebaceous glands and may constitute the major barrier towards skin penetration. A countercurrent distribution study has led to isolation of crystalline components which are at least in part responsible for the observed variation. (Author)

COMPOSITION OF ZINC PHOSPHATE COATINGS, by Jodie Doss. 28 Oct 57, 21p. 9 refs. Rept. no. 57-2612.
Order from LC mi$2.70, ph$4.80 PB 147 432

Determinations were made for phosphate (PO_4), zinc (Zn) and iron (Fe) in zinc phosphate coatings formed in four different solutions after various processing times. The percent of phosphate (PO_4), zinc (Zn) and iron (Fe), found in zinc phosphate coatings remains approximately the same regardless of the processing time, the accelerator used, or the operating condition of the phosphating solution. The coatings were found to contain approximately 40.8 percent phosphate (PO_4), 12.3 percent iron (Fe), and 32.3 percent zinc (Zn). The sum of the above percentages was found to be approximately 85.4 percent. The remaining 14.6 percent of the coating was presumed to be water. (Author)

FLAME PHOTOMETRIC STUDY OF BORON [AND] FLAME PHOTOMETRIC DETERMINATION OF ELEMENTS ASSOCIATED WITH BORON IN BORON CONTAINING COMPOUNDS. PART I: COPPER, by John A. Dean, Morton Salkind, and Clarice Thompson. Final proj. rept. on Subcontract [NOa(s) 52-1023]. June 54, 53p. 16 refs. MCC-1023-TR-59.
Order from LC mi$3.60, ph$9.30 PB 147 017

This investigation describes the application of the flame photometer to the rapid, routine determination of boron. The method should be of particular interest to those laboratories that are concerned with borohydrides and other boron containing compounds. The flame photometric procedure offers a rapid instrumental means of determining boron compared to conventional distillation methods and is particularly applicable to the processing of a large number of samples. Determinations of boron by means of the green flame coloration are discussed by Stahl and applied to agricultural materials by McHargue, McHargue and Calfee, Calfee and McHargue, and Weber and Jacobson. These workers used either visual methods or photographic recording in conjunction with a spectrograph.

CHAIN-TRANSFER OF NITRO COMPOUNDS IN POLYMERIZATION REACTIONS, by T. R. Fukuto and J. P. Kispersky. Rept. on Contract N7onr-462, T.O. 1. 25 May 53, declassified 20 Apr 60, 38p. 47 refs. Rept. no. 700 (Special).
Order from LC mi$3.00, ph$6.30 PB 147 271

The chain transfer constants for 12 aliphatic nitro compounds and a nitrate ester with methyl methacrylate were found to vary from $< 10^{-4}$ to 1. Several possible mechanisms for the transfer reaction are discussed. The inhibition of methyl methacrylate polymerization is reported. The reason for the inhibition is believed to be the formation of NO_2. Attempts to determine the chain-transfer constants of the nitro compounds with styrene and vinyl acetate were unsuccessful. The polymerization of 2,2,2-trinitroethyl methacrylate using various initiator concentrations gave a polymer with a constant molecular weight, corresponding to a $\overline{P}_n$ of about 12.

EFFECT OF CIS-TRANS ISOMERISM ON THE UREA INCLUSION COMPOUND FORMING-ABILITY OF A MOLECULE: A STUDY OF THE MALEATE-FUMARATE SYSTEM, by Jack Radell, Joseph W. Connolly, and William R. Cosgrove, Jr. Feb 60, 13p. 9 refs. WADC Technical note 59-407.
Order from OTS $0.50 PB 161 730

Several maleates and fumarates were investigated to determine their ability to form urea inclusion compounds. Olefinic esters of both acids will form inclusion compounds. However, the shortest chain required to stabilize a particular ester was related to the over-all cross-sectional diameter of the ester. The fumarates, having the more slender conformation form complexes more readily than the maleates. (Author)

THE MECHANISM OF THE PHOTOCHLORINATION OF SIMPLE CHLORINATED HYDROCARBONS, by S. Dusoleil, P. Goldfinger and others. Final technical rept. on Contract DA 91-591-EUC-994. Dec 59, 78p. 36 refs.
Order from LC mi$4.50, ph$12.30 PB 147 435

The number of parameters measured in the reaction system Cl_2, C_2Cl_4, C_2HCl_5 leading to a unique set of elementary rate constants seems to settle definitely the mechanism of this reaction between room temperature and 500°K. It leads to a general outlook on the mechanism of the photochlorination of more or less chlorinated simple hydrocarbons. (Author)

Carbon Research Lab., U. of Buffalo, N. Y.
INVESTIGATION OF ELASTIC AND THERMAL PROPERTIES OF CARBON-BASE BODIES, by S. Mrozowski, J. F. Andrew and others. Rept. for May 58-June 59 on Ceramic and Cermet Materials, Contract AF 33(616)5186. Mar 60, 93p. 21 refs. WADC Technical rept. 58-360, Pt. 2.
Order from OTS $2.25 PB 161 733

In continuation of the work four basic types of carbon were prepared from (1) soft filler and soft binder, (2) soft filler and hard binder, (3) hard filler and soft

binder, (4) hard filler and hard binder. Elastic moduli, permanent set, shrinkage and density; electric resistivity and thermal expansion coefficient were investigated in dependence on heat treatment temperature and also the variation of the heat conductivity and electrical resistivity on ambient temperature in the range 1200-3000°C. An apparatus for direct determination of the heat diffusivity in the temperature range 100-700°C was set up and reasonably good data for the diffusivity coefficient obtained. Studies of ultra-attenuation show that the decay in intensity of transmitted waves is due to: (1) energy losses due to hysteresis effect present for all wavelengths, (2) scatter of waves by pores, observable only when the wavelength becomes shorter than 10 particle diameters. A discussion of the merits of various types of carbons closes the report. (Author)

NONIONIC DETERGENTS IN NONAQUEOUS SOLVENTS 1: THE BEHAVIOR OF α-MONOGLYCERIDES (Cont'd), by P. Debye and H. Coll. Technical rept. no. 2 on Contract Nonr-401(17). 15 May 59, 45p. 28 refs.
Order from LC mi$3.30, ph$7.80 PB 146 513

The behavior of α-monoglycerides (α-monoesters of glycerin and fatty acids with chains from 10 to 18 carbon atoms) has previously been studied in this laboratory, and the results have been communicated. These results formed the basis for the present investigation. Most important was the conclusion that light scattering showed the formation of clusters containing 20 to 70 monomers of monoglycerides in benzene, and that hydrogen bonds are effective in this association. In the presence of certain impurities, other than water, the clusters appeared to expand, as evidenced by higher intensities of scattered light. Likewise, the clusters appeared to be smaller in chlorobenzene, and also smaller in the case of esters with longer fatty acid chains.

INVESTIGATION OF SYNTHETIC METHODS FOR PREPARING THE FLUORO DERIVATIVES OF SYMMETRICAL TRINITROBENZENE, by Victor L. Siele and Harold J. Matsuguma. Apr 60, 20p. 19 refs. Technical rept. 2682.
Order from LC mi$2.40, ph$3.30 PB 145 510

Three synthetic reaction schemes leading toward the preparation of fluoro-2, 4, 6-trinitrobenzene, 1, 3-difluoro-2, 4, 6-trinitrobenzene, and 1, 3, 5-trifluoro-2, 4, 6-trinitrobenzene have been investigated. The methods employed involved: (a) the nitration of fluorobenzene, 1, 3-difluorobenzene, and 1, 3, 5-trifluorobenzene; (b) the replacement of chlorine in chloro-2, 4, 6-trinitrobenzene, 1, 3-dichloro-2, 4, 6-trinitrobenzene, and 1, 3, 5-trichloro-2, 4, 6-trinitrobenzene with fluorine by indirect fluorination; and (c) the replacement of the hydroxyl groups in picric acid, styphnic acid, and trinitrophloroglucinol with fluorine, using phosphoryl fluoride as the fluorinating agent. Attempts to prepare these compounds have been unsuccessful. It has been shown conclusively that the fluoro derivatives of trinitrobenzene cannot be prepared by the nitration or phosphoryl fluoride approaches. The halogen exchange method deserves further consideration, since in a few isolated experiments exchange was apparent. A more active potassium fluoride, namely potassium fluorosulfinate, will be investigated as a possible exchange reagent. (Author)

SINGLE-POINT DETERMINATION OF INTRINSIC VISCOSITY, by Marie C. Orsini, Richard J. Valles, and David W. Levi. May 60, 4p. 11 refs. Technical rept. 2687.
Order from LC mi$3.30, ph$7.80 PB 146 400

Intrinsic viscosities of stereoregular polybutene-1 fractions were determined in decalin at 115°C. Use of the Hart rearrangement of the Schulz-Blaschke equation at specific viscosities below 1 made it possible to calculate intrinsic viscosities from single-point determinations after estimation of N in the equation from complete intrinsic viscosity data on three or more fractions. The single-point procedure for low specific viscosities was applied to data previously obtained for a series of alkyl methacrylate polymers in good and in poor solvents. In every case the agreement between experimental and calculated values was found to be reasonably good, generally falling within the range of the experimental error. At higher specific viscosities N appeared to depend on η_{sp} as observed by Hart, although the data was somewhat limited. (Author)

THERMOANALYTICAL CHARACTERIZATION OF SEVERAL QUINOL CLATHRATE COMPOUNDS, by Martin Gilford and Saul Gordon. Mar 60, 27p. 13 refs. Technical notes no. 41.
Order from LC mi$2.70, ph$4.80 PB 145 517

Quinol host clathrates of sulfur dioxide, carbon dioxide, and methanol have been prepared following methods appearing in the literature. The stoichiometry of the prepared complexes has been established. The techniques of differential thermal analysis (DTA) and thermogravimetry (TGA), under ambient and reduced pressures, have been applied in a study of their thermally induced decomposition. Endothermal behavior has been found to attend the breakdown of the clathrate complex with escape of the included guest species. This decomposition occurs at temperatures 10 to 86 degrees below the melting point of the quinol host, which is 173.5°C. The pressure dependency of this breakdown has been established by both DTA and TGA techniques. Application of hot-stage microscopy has given evidence of the temperature range over which decomposition occurs. (Author)

ON SOME UNSTEADY FREE MOLECULAR SOLUTIONS TO THE BOLTZMANN EQUATION, by E. Kornowski. Rept. on Contract AF 04(647)269. Nov 59, 22p. 4 refs. Technical Information Series R59SD463.
Order from LC mi$2.70, ph$4.80 PB 146 820

The unsteady free molecular solutions to the Boltzmann equation are found for the filling of regions whose configurations are a channel, cylinder, and sphere. The density profiles, as a function of space and time, are presented. It is shown that the density profiles obtained for the filling of the cylinder can be applied toward obtaining the density profiles aft of a sphere moving through a rarefied gas.

Army Signal Research and Development Lab., Fort Monmouth, N. J.
INVESTIGATION OF THE HYDROGEN-OXYGEN FUEL CELL, by H. Hunger. 15 Dec 58, 56p. 36 refs. USASRDL Technical rept. 2001; AD 219 732.
Order from LC mi$3.60, ph$9.30 PB 147 388

Results are presented to advance the general knowledge of fuel cells and to provide a basis for the construction of a practical hydrogen-oxygen fuel cell. New information, offered as a result of this investigation, includes the importance of a preliminary CO_2 gas activation on the current carrying ability of the hydrogen electrodes, the theoretical conclusions concerning gas transportation to the reaction zone, and the influence of the wet-proofing treatment on this transportation. These theoretical considerations, amply supported by experiments, present new concepts regarding the choice of electrode carriers and surface qualities of the pores. (Author)

FUNDAMENTAL ASPECTS OF THE DIELS-ALDER REACTION, by Harold Kwart, Isabel Burchuk, and Christel Kappes. Technical rept. on Contract [Nonr-018(00)]. 15 June 51, 31p. 29 refs.
Order from LC mi$3.00, ph$6.30 PB 147 129

Various aspects of the theories advanced to depict the mechanism of the Diels-Alder reaction are discussed. Various quantitative measurements are in progress which may permit a decision between alternative suggestions offered in explanation of retrodiene decomposition. Factors that determine the ease of formation and stability of an adduct are being studied. Several observations are reported which point up precise lines of experimentation. A very versatile Diels-Alder system has been prepared and identified and its properties reported for the first time here. The design and construction of a special spectrophotometer is reported, which will enable us to make rapid and accurate measurements of the quantities sought.

Carnegie Inst. of Tech., Pittsburgh, Pa.
THE SPECIFIC HEATS OF $NiCl_2 \cdot 6H_2O$ AND $CoCl_2 \cdot 6H_2O$ BETWEEN 1.4° AND 20°K, by W. K. Robinson and S. A. Friedberg. Technical rept. no. 5 on Contract Nonr-760(05). 20 July 59, 29p. 27 refs. AD-219 870.
Order from LC mi$2.70, ph$4.80 PB 147 088

The specific heats of $NiCl_2 \cdot 6H_2O$ and $CoCl_2 \cdot 6H_2O$ have been measured from 1.4° to 20°K. Lambda-type anomalies were observed at 5.34°K and 2.29°K for $NiCl_2 \cdot 6H_2O$ and $CoCl_2 \cdot 6H_2O$, respectively, associated presumably with antiferromagnetic-paramagnetic transitions. It has been possible in each case to separate out the magnetic contribution to the specific heat and thus to compute the total magnetic entropy gained in the transition from the fully ordered to completely disordered condition. This quantity was found to be given accurately by R ln $(2S + 1)$ with $S = 1/2$ for Co^{++} and $S = 1$ for Ni^{++}. Short range order is particularly pronounced in these substances, the fraction of the total magnetic entropy gained above the Néel point being 0.52 for $CoCl_2 \cdot 6H_2O$ and for 0.40 for $NiCl_2 \cdot 6H_2O$. Other features of the anomalies are discussed. (Author)

City Coll. of the City of New York.
CATHODIC FORMATION OF METAL HYDRIDES, by Bernard Goldschmidt and Hugh W. Salzberg. Technical rept. no. 2 on Arsine Evolution at Arsenic Cathodes, Contract Nonr-1597(02). 9 Jan 58, 15p. 8 refs.
Order from LC mi$2.40, ph$3.30 PB 137 956

The overall purpose is the study of hydrogen evolution in acid solutions at low current densities, using chemical methods. The arsenic-arsine system was selected for study since arsine is known to form at low current densities and furthermore, methods for determination of microgram quantities of arsine have been worked out.

Cornell Aeronautical Lab., Inc., Buffalo, N. Y.
GRAPHICAL COMPUTATION OF SHOCK AND DETONATION WAVES IN REAL GASES, by George H. Markstein. Rept. on Project Squid, Contract Nonr-1858(25). May 59, 16p. 5 refs. Technical rept. CAL-78-P.
Order from LC mi$2.40, ph$3.30 PB 146 447

The conservation relations across a shock or detonation wave are represented in the form of a graph applicable to real gases of arbitrary composition. Computation of shock waves reflected from a closed end is performed by means of another universally applicable graph. (Author)

Cryogenic Lab., Ohio State U. Research Foundation, Columbus.
THERMAL, STRUCTURAL, ELECTRICAL, MAGNETIC AND OTHER PHYSICAL PROPERTIES OF THE GROUP V ELEMENTS: TANTALUM, NIOBIUM (COLUMBIUM) AND VANADIUM, by Esther Richert, C. W. Beckett, and H. L. Johnston. Rept. on Contract W33-038-ac-17721. 1 Dec 49, 64p. 29 refs. ATI-81 819; 102-AC49/11-100.
Order from LC mi$3.90, ph$10.80 PB 147 562

The data on the physical properties of the metals, tantalum, niobium (columbium), and vanadium which have been published in the scientific literature during the period between 1917 and 1948 are summarized in this report. Emphasis has been given to the thermal properties. Thermal functions were calculated for these metals. Other physical properties discussed in this report are melting and boiling points, atomic weight and isotopic constitution, crystal structure, compressibility, thermal expansion, spectral emissivity and electrical properties. (Author)

EXPLORATORY STUDIES OF COMBUSTION IN SUPERSONIC FLOW, III. CHEMICAL REACTIONS IN A SUPERSONIC BOUNDARY LAYER. IV. SUPERSONIC FLAME STABILIZATION, by Walter Chinitz and Robert A. Gross. Rept. on Project Squid, Contract Nonr-1858(25). June 59, 26p. 6 refs. Technical rept. FED-1-R-P.
Order from LC mi$2.70, ph$4.80 PB 146 517

This report discusses experiments in the stabilization of flames in supersonic flow and chemical reactions in the boundary layer of a flat plate immersed in a supersonic stream. This research was carried out in the steady-state supersonic tunnel.

Feltman Research and Engineering Labs., Picatinny Arsenal, Dover, N. J.
EFFECTS OF X-RAY AND GAMMA RAY IRRADIATION ON THERMAL DECOMPOSITION OF SOLID AMMONIUM PERCHLORATE, by Eli S. Freeman and David A. Anderson. Apr 60, 29p. 8 refs. Technical rept. 2673.
Order from LC mi$2.70, ph$4.80 PB 144 527

The low-temperature solid state thermal decomposition of ammonium perchlorate was appreciably enhanced by pre-irradiation with X-ray and gamma ray radiation. This increase in chemical reactivity occurred in three stages, (a) before and during crystalline transition from 200° to 260°C, (b) over the temperature range of 260° to 310°C, and (c) over the temperature range of 310° to 385°C. These results were obtained by differential thermal analysis and thermogravimetric experiments carried out under ambient and reduced pressures at the nominal heating rate of 5°C per minute. The sensitivity of the various stages of reaction to exposure dose, as shown by the relative variation in the parameters of the differential thermal analysis reaction bands, indicates the possibility of using the solid state decomposition of ammonium perchlorate for dosimetry. The decomposition spectrum of samples of sublimed ammonium perchlorate was found to be similar to that of irradiated samples. The effects of impurities formed during irradiation; doping with silver, cupric, and iodide ions; recrystallation; and partial decomposition were also investigated. From microscopic observations, it appeared that there were preferential sites of reaction in the interior of the irradiated crystals. The increased chemical reactivity of irradiated ammonium perchlorate is attributed to positive holes and other defects formed during irradiation which favor the electron transfer mechanism of decomposition. (Author)

FLUOROCARBON NF COMPOUNDS, by J. A. Young and R. D. Dresdner. Quarterly technical rept. no. 2, 1 Oct-31 Dec 59, on Contract DA 01-009-ORD-772. [1959] 18p. 5 refs. AD-231 426.
Order from LC mi$2.40, ph$3.30 PB 145 716

The electrochemical fluorination of pyridine is described. At a lower voltage than reported heretofore, a much larger yield of the coupled product, dipiperidyl, was obtained. A convenient and efficient method for the production of N_2F_4 has been found, which consists of bubbling NF_3 through heated mercury in a steel reactor. At a temperature of 323°C and a contact time of the order of 30-60 seconds, N_2F_4 was obtained in yields of 60-100% and conversions per pass as high as 60%, on 10 gram runs. Spectral evidence indicated that N_2F_2 was also formed in small quantity. The addition of N_2F_4 to $CF_3CF{=}CF_2$ in a flow system over a CsF surface is under study. Preliminary results show that reaction occurs at 250°, but the products have not yet been identified. Although efforts to prepare $(CF_3CO)_2NBr$ for addition to fluorinated olefins have so far been unsuccessful, it has been found that N-alkyl amides can be added directly to olefins, and a 52% yield of adduct was obtained from $CF_3CF{=}CF_2$ and $CF_3CONHCH_3$. The reaction is currently being extended to the imides $(R_FCO)_2NH$. Indirect fluorination of imides with AgF_2 leads to cleavage of the amide linkage. $(CF_3CO)_2NH$ gave CF_3COF and $CF_3N{=}C{=}O$, while $CF_2(CF_2CO)_2NH$ gave only a solid product, possibly the silver salt of the imide. A possible mechanism for the reaction is described. (Author)

ON THE DETERMINATION OF DIFFUSION COEFFICIENTS IN CHEMICAL DIFFUSION, by R. W. Balluffi. Rept. on Contract AF 18(603)106. 11 Feb 60, 11p. 10 refs. AFOSR-TN-60-239.
Order from LC mi$2.40, ph$3.30 PB 146 444

The equations describing chemical diffusion in the general case where the partial molal volumes of the diffusing components may differ and may vary with composition are reviewed and discussed. The results should replace the standard Darken equations and Boltzmann-Matano analysis.

Illinois U. Engineering Experiment Station, Urbana.
PREPARATION AND PROPERTIES OF PHOSPHIDES AND SILICIDES AND SOME ELECTROCHEMICAL STUDIES, by S. S. Hsu, P. N. Yocom and others. Final rept. for 1 July 53-31 Dec 58 on Contract N6ori-071(50). [1959] 6p. 7 refs. AD-218 784.
Order from LC mi$1.80, ph$1.80 PB 147 079

Attempts were made to develop anodes suitable for electrochemical use. The following phosphides were prepared in a pure state by fused salt electrolysis: Ni_3P, Ni_7P_3, Ni_2P, Co_2P, and Mo_3P. MoP, MnP, W_3P, and WP were also prepared. A cast of Ni_2P was prepared and subjected to metallographic examination. Attempts to cast the Fe_2P-Ni_2P and Co_2P-Ni_2P systems were successful. Cast samples, particularly the mixed phosphides, were generally more resistant to corrosion in all solutions than powders. A cast Ni_2P microelectrode was found which was more suitable as an anode than one of sintered CrP. A correlation of the corrosion efficiencies of microanodes of single phosphides indicated that FeP was most resistant in acid and Ni_2P in alkali. Precision lattice constants of Ni_3P (tetragonal), Ni_2P (hexagonal), Fe_2P (hexagonal), Co_2P (orthorhombic), and W_3P (tetragonal) were found from powder X-ray diffraction patterns by the least squares method. Investigations were made of the compositions of the baths and the course of the electrolysis. Direct combination of the elements was found to be more satisfactory than fused salt electrolysis for the preparation of silicides of Fe, Co and Ni. A study of the electrolysis of pure sodium metaphosphate at 900°C was conducted. Attempts were made to prepare and study the behavior of silicides as anodes with a study of an Fe-P-Si system.

Instituto di Metallurgia e Metallografia, Universita' degli Studi di Roma (Italy).
STUDY ON THE BEHAVIOUR OF DEFECT METALLIC SURFACES OF SINGLE-CRYSTALS IN OXIDATION EXPERIMENTS UNDER CONTROLLED ATMOSPHERE, by Felice de Carli. Final technical rept. for 1 Nov 59-30 Jan 60 on Contract DA 91-591-EUC-1022-01-1175-59. [1960] 16p. 37 refs.

BURNING RATES OF SOLID PROPELLANTS, by Gerald Rosen. Rept. on Contract Nonr-1858(25). July 59, 23p. 8 refs. Proj. Squid Technical rept. PR-95-P.
Order from LC mi$2.70, ph$4.80 PB 147 068

The burning mechanism of a solid propellant is described in terms of a pyrolysis law, a premixed laminar flame, and nothing more. A quantitatively accurate burning rate formula is derived from the theory. The predicted burning rate pressure dependence agrees with the experimental results for ammonium perchlorate propellants. (Author)

James Forrestal Research Center, Princeton U., N. J.
GENERALIZATION OF THE LAMINAR FLAME ACTION PRINCIPLE FOR ARRHENIUS-TYPE RATE FUNCTIONS, by Gerald Rosen. Rept. on Contract Nonr-1858(25). July 59, 7p. 2 refs. Proj. Squid Technical rept. PR-94-P.
Order from LC mi$1.80, ph$1.80 PB 147 067

The action principle for the laminar flame can be extended to include reaction rate functions which do not vanish at the cold boundary. The generalization leads to an unambiguous approximation procedure for determining the burning velocity and temperature distribution associated with arbitrarily specified rate functions. (Author)

Linfield Research Inst., McMinnville, Oreg.
RESEARCH ON ELECTROLYTIC MICROMACHINING TECHNIQUES OF REFRACTORY METALS FOR USE IN FIELD EMISSION DEVICES: I. THE PROPERTIES OF ANODICALLY FORMED OXIDE FILMS ON TUNGSTEN, by H. W. Pitman and D. C. Hamby. Final rept. for 15 July 58-15 Sep 59 on Contract DA 36-039-sc-78191. [1959] 95p. 33 refs. AD-230 953.
Order from LC mi$5.40, ph$15.30 PB 146 794

The properties of anodically formed oxide films on tungsten have been investigated in the ionic current density range from 0.037 to 8.6 ma/cm^2. The validity of the exponential law $i_+ = \alpha \exp \beta F$ has been established for the anodic oxidation of tungsten in 0.1 N

sulfuric acid at 25.0°C. Expressions relating the field F in the film during anodization have been deduced. Agreement between the coulometric and optical measurements is about 4 percent, the chief source of difference being in the relatively low accuracy of the density determination, required in the interpretation of the coulometric data. The constants found for the exponential law are $\log_{10} \alpha = -12.45 \pm 0.3$, α being expressed in ma/cm^2; $\beta = (5.22 \pm 0.08) \times 10^6$ cm/volt. (See also PB 146 496)

Little, Arthur D., Inc., Cambridge, Mass.
A NEW INSTRUMENT FOR THE DETERMINATION OF MOLECULAR WEIGHT BY DIFFERENTIAL VAPOR PRESSURE, by Norman M. Wiederhorn, Jay H. Vreeland, and Ruby H. Thomson. Rept. for Oct 58-Oct 59 on Experimental Techniques for Materials Research, Contract AF 33(616)5483. Feb 60, 16p. WADC Technical rept. 59-724.
Order from OTS $0.50 PB 161 711

The differential vapor pressure molecular weight instrument developed previously was subjected to use and further evaluated with regard to sensitivity, reproducibility, and accuracy. To do this, a number of materials having molecular weight in the range 300 to 20,000 were used. The device is capable of measuring number average molecular weights up to 2000 at solution concentrations of 0.1% (gms/100cc). In order to extend the range of the instrument to molecular weights of 20,000, it is necessary to work with at least 1% solutions. At these concentrations, the instrument is accurate to approximately ± 5%. A glass valve assembly and metal-coated Mylar sensing foils have been developed for use with the instrument. These facilitate the manipulations when making measurements and minimize maintenance problems. (Author) (See also PB 151 832)

New York State Coll. of Ceramics, Alfred U.
CHEMICAL-PHYSICS OF CATALYST SURFACES, by T. J. Gray. Rept. on Contract AF 49(638)288. [1959] 17p. 15 refs. AFOSR-TN-60-413.
Order from LC mi$2.40, ph$3.30 PB 147 495

A model is presented representing the electronic constitution of the surface of a catalyst based on the band theory of solids. It follows implicitly that there will be a direct correlation with any process involving a variation of the electron cloud distribution as occurs during chemisorption and reaction processes. Measurements of the electronic properties of the surface region of catalysts under dynamic conditions afford valuable indirect methods for determining the kinetics of adsorption, reaction and desorption processes in great detail. The model leads to the possibility of qualitative prediction of the action of certain promoters and suggests possible ways of modifying selectivity. The model is general in applicability and covers photocatalytic processes which are demonstrated to make possible the applicational use of high efficiency photochemical processes. Direct correlation is suggested with the photocatalytic syntheses in biochemical reactions. (Author)

ELECTRON SPIN RESONANCE STUDIES OF SEMIQUINONES AND THE C-F BOND, by D. H. Anderson Peter J. Frank, and H. S. Gutowsky. Technical rept. no. 19 on Contract Nonr-1834(13). 26 May 59, 30p. 41 refs. AD-219 834.
Order from LC mi$2.70, ph$4.80 PB 146 448

The electron spin resonance spectrum has been observed for a solution of tetrafluoro p-benzosemiquinone and a value, $a_F = 4.14 \pm 0.08$ gauss, obtained for the fluorine hyperfine splitting. It is concluded that this splitting is caused by the σ-π configuration interaction proposed for protons attached to an aromatic free radical. The results show that the fluorine orbital in the C-F bond contains about 5% s-character. The electron spin density, ρ_C, at a carbon atom in an aromatic free radical is related to a_F, for a fluorine bonded to the carbon, by the approximate relation $a_F = 39\rho_C$. Data are presented which can be explained by assuming the semiquinone free radicals produced by air oxidation of hydroquinones in alcoholic KOH dimerize or otherwise react in concentrated solution to give radicals with oxygen linkages, while dibenzosemiquinone radicals are produced from quinones under reducing conditions. A brief description is given of the X-band spectrometer which was used, and also the details of an electronic device to sweep the field of the electromagnet. (Author)

Oxford U. (Gt. Brit.)
A STUDY OF DIFFUSION IN A REACTING SYSTEM, by P. G. Dickens, D. Schofield, and J. Walsh. Rept. on Contract AF 61(514)1117. Feb 60, 18p. 9 refs. AFOSR-TN-59-868.
Order from LC mi$2.40, ph$3.30 PB 147 106

The purpose of the present work was to derive and solve numerically the diffusion equation in the general case. The results are compared with the solutions obtained by the earlier approximate treatments, thus enabling the range of validity of such treatments to be properly assessed.

Polytechnic Inst. of Brooklyn, N. Y.
A THEORY OF ELECTRON TRANSFER PROCESSES AT ELECTRODES, by R. A. Marcus. Technical rept. no. 2 on Contract Nonr839(22). 1 July 59, 16p. 5 refs. AD-218 735.
Order from LC mi$2.40, ph$3.30 PB 147 076

The foundations of a quantitative theory of electron transfer processes at electrodes are described. A weak electronic interaction was assumed between the electrochemically active ion and the electrode. The quantum mechanical consequences of this assumption were investigated. The results indicated that the atomic coordinates of the activated complex are those which lie on a many-dimensional surface lying at the intersection of 2 potential energy surfaces. The surfaces are those which are obtained for each of the 2 redox states of the ion-electrode system in the hypothetical case of zero electronic interaction. A method was outlined for determining the free energy of formation of the activated complex. This calculation

permits the computation of the current and its dependence on activation over potential. Depending on the extent of electronic interaction, electron transfer was shown to proceed adiabatically or nonadiabatically. Applications of the Franck-Condon principle in qualitative discussions of electron transfers in solution and at electrodes and their relation to the theory outlined above were examined. Some conclusions based on the behavior of the one-dimensional potential energy curves were questioned since the important part played by the rearrangement of the atomic configuration of the entire system in an electron transfer was not recognized.

Princeton U., N. J.
CONSIDERATION OF HYDRAZINE DECOMPOSITION, by I. J. Eberstein and I. Glassman. Technical rept. on Contract AF 18(600)1527. 11 Dec 59, 24p. 23 refs. Aeronautical Engineering Lab. rept. no. 490; AFOSR-TN-60-352.
Order from LC mi$2.70, ph$4.80 PB 146 901

A brief investigation of the molecular structure of hydrazine is presented. Catalysis of hydrazine decomposition on metal surfaces is discussed. It was found that metals having incomplete d-subshells act as strong catalysts for hydrazine decomposition, whereas metals having no d-subshells, or complete d-subshells act as non-catalysts. Initial steps for hydrazine decomposition under various conditions are proposed and inhibitors for such decomposition are suggested. Inhibitors may be ammonia, aniline, toluene, and xylidene or toluidene.

Queen Mary Coll., U. of London (Gt. Brit.)
THE STUDY OF FREE-RADICAL INTERMEDIATES FORMED DURING THE OXIDATION OF ORGANIC MESOMERIC COMPOUNDS BY METAL IONS IN SOLUTION BY MEANS OF ELECTRON SPIN RESONANCE SPECTROSCOPY. Annual technical rept. for 1 Oct 58-30 Sep 59 on Contract DA 91-591-EUC-945. [1959] 9p. AD-233 210.
Order from LC mi$1.80, ph$1.80 PB 146 832

It was proposed to investigate the oxidation of organic compounds by compounds of the transition metals. In these reactions free-radicals are often postulated as intermediates and a sensitive electron-spin resonance spectrometer for the detection of such radicals has been constructed. The spectrometer has been used to study the oxidation of 2:6-ditertiarybutylphenol. (Author)

THE DEPTH OF THE SURFACE ZONE OF A LIQUID, by J. C. Henniker and J. W. McBain. Technical rept. no. 5 on Properties of Surfaces, Contract N6ori-154, T.O. 2. 31 Mar 48, 44p. 175 refs. ATI-63 755.
Order from LC mi$3.00, ph$7.80 PB 146 951

Data from widely scattered sources indicate that the molecules of many liquids are highly oriented in the neighborhood of surfaces. A group of 175 references is presented in the order of the degree of certainty with which they demonstrate deep surface orientation.

Stanford Research Inst., Menlo Park, Calif.
IONIZATION IN FLAMES: THE ROLE OF COMPLEX HYDROCARBONS AND THE IONIZATION OF MIXTURES, by Felix T. Smith. Technical rept. 1 on Contract AF 04(645)66. May 57, 43p. 38 refs. WDD Doc. no. 7-5190; AD-216 841.
Order from LC mi$3.30, ph$7.80 PB 147 022

Research on flame ionization led to several equilibrium considerations. A survey of the experimental and theoretical information on ionization potentials of organic compounds showed that many of them, which may be present in flames (in small quantities individually, but in a noticeable amount in the aggregate), can be very readily ionized. Expressions that can be used in calculating the equilibrium ionization to be expected from mixtures of such species and other materials are developed. With regard to nonequilibrium processes, a possible role is suggested for large organic molecules and small carbon particles. They may accumulate energy from small excited molecules, and become hot enough to ionize, giving up this energy only rather slowly to the translational and rotational motion of the gas. The evaluation of this and other possible nonequilibrium processes requires study of time-dependent processes such as the growth, reactions, decay, and mechanisms of energy transfer of large molecules in flames.

Ultrasonic and Electrochemistry Research Lab., Western Reserve U., Cleveland, Ohio.
THE STUDY OF THE KINETICS OF THE HYDROGEN, OXYGEN, AND RELATED ELECTRODES, by Ernest Yeager, Harry Dietrick, and Frank Hovorka. Technical rept. no. 1 on Contract Nonr-581(00). 15 Dec 51, 43p. ATI-170 028.
Order from LC mi$3.30, ph$7.80 PB 147 809

The problems associated with the use of oxygen gas and hydrogen gas as anode and cathode materials in primary cells are discussed in terms of kinetics of these electrodes. The electronic instrumentation to be used for the polarization measurements is described with respect to design and operation. Emphasis is placed upon the determination of the rate of decay and build-up of the polarization at individual electrodes.

Washington U. [Seattle]
THE REACTION OF PEROXYDISULFURYL DIFLUORIDE WITH SULFUR DIOXIDE AND WITH FLUORINE, by George H. Cady and John E. Roberts (Massachusetts U). Technical rept. no. 22 on Contract Nonr-477(16). 1959, 7p. 6 refs.
Order from LC mi$1.80, ph$1.80 PB 147 070

Peroxydisulfuryl difluoride reacts with fluorine to give fluorine fluorosulfonate and with sulfur dioxide to give a compound of empirical formula $S_3O_8F_2$. The latter has been characterized. (Author)

THE MORPHOLOGY OF GEOMAGNETIC MICROPULSATIONS, Pc, by J. A. Jacobs and K. Sinno.

Scientific rept. no. 1 on Contract AF 19(604)4068. 19 June 59, 18p. 9 refs. AFCRC-TN-59-468.
Order from LC mi$2.40, ph$3.30 PB 146 152

An analysis of the occurrence frequency of geomagnetic micro-pulsations Pc has been carried out using data obtained during the IGY from a world-wide network of stations.

Massachusetts U., Amherst.
OBSERVATIONS ON PHOTO INTERPRETATION OF CAROLINA "BAYS" AND ASSOCIATED FEATURES, by David Jon Hagar (U. of Maine). Technical rept. no. 2-A on Contract Nonr-2242(00). July 59, 41p. 7 refs. AD-220 753.
Order from LC mi$3.30, ph$7.80 PB 147 095

In order to provide a basis of comparison for photo interpreters dealing with the Carolina "bays" or with comparable features in regions having similar climatic characteristics, the report endeavors to correlate the expression of selected bays as seen on air photos with actual conditions on the ground as determined by field observations. For each of seven areas covered, the following are discussed: location; setting; topography; drainage; surficial material; vegetation; and passability. Generalized conclusions concerning the areas discussed were outlined.

Climatology and Meteorology

Air Weather Service, Scott AFB, Ill.
AWS TERMINAL FORECAST (TFAWS CODE). 1 Apr 57, 14p. AWSM 105-25 and AWSM-105-25A, 11 Feb 59; supersedes AWSM 105-25, 1 July 54; AWSM 105-25A, 1 Nov 54; AWSM 105-25B, 1 Feb 55; and AWSM 105-25C, 15 Feb 56.
Order from LC mi$2.40, ph$3.30 PB 146 947

Air Weather Service Terminal Forecast Code (TFAWS) groups are appended to surface observations to set forth forecast cloud height or ceiling, visibility and weather at terminals during a definite period of time. The TFAWS code groups are intended as an aid to pilots and the briefing forecaster. Because of limited teletypewriter time and the relatively few code groups transmitted, it is impossible to give a complete picture of the terminal weather using TFAWS code groups. The TAFOR code (FM 51.A) is a more complete terminal forecast code.

Army Signal Research and Development Lab., Fort Monmouth, N. J.
DOUBLE-DIRECTION-FINDING ROCKET METEOROLOGICAL SENSING SYSTEM, by D. E. Cline. 15 July 58, 29p. USASRDL Technical rept. 1981.
Order from LC mi$2.70, ph$4.80 PB 146 932

A proposal is presented for a meteorological rocket system for sounding the winds to approximately 200,000 feet, with an inherent capability for telemetering other meteorological parameters. The system would be composed of a Loki rocket, 1680-mc transmitter with special antenna, wafer-cell battery, suitable switching for the transmitter, parachute, and means for ejecting the instrumentation at the peak of the missile's trajectory. The geometry of the problem is similar to the determination of winds aloft utilizing two theodolites on a known baseline. It is concluded that a High-Altitude Double-Direction-Finding System possesses many advantages over presently devised systems, and that with a modest expenditure of time, money, and manpower, a working system could be evolved which would serve as both a research tool and an operation item for use at rocket proving grounds. CALIBRATION OF A WEATHER RADAR USING A STANDARD TARGET, by D. Atlas and S. C. Mossop. Technical (Scientific) note no. 1 on Contract AF 61(052)254. Sep 59, 19p. 6 refs. AFCRC-TN-59-477; AD-231 806.
Order from LC mi$2.40, ph$3.30 PB 146 818

A simple method is described for calibrating a weather radar by means of a standard spherical target, thus permitting the radar to be used for quantitative measurements of storm reflectivity. The technique involves determination of that storm reflectivity which provides an echo equivalent to that from the known target. The sphere, suspended from a balloon, is tracked as it leaves the radar site. Its echo is "measured" by reducing the receiver gain control to the threshold of visibility. The threshold gain setting is thereby calibrated and subsequently provides an accurate measure of storm reflectivity. There is no need for any other test equipment such as a microwave signal generator. Absolute accuracy is greater than that attainable with a signal generator since no reliance need be placed on the generator calibration or upon the specified antenna gain. (Author)

Laboratory of Climatology, Centerton, N. J.
MICROCLIMATIC INVESTIGATIONS AT POINT BARROW, ALASKA, 1956, by J. R. Mather and C. W. Thornthwaite. Technical rept. no. 1 [on Contracts N7onr-367(01) and Nonr-1138(01)] 1956, 47p. 4 refs. Publications in Climatology vol. 9, no. 1.
Order from LC mi$3.30, ph$7.80 PB 137 849

This report provides an evaluation of the current program of microclimatic observations in the Arctic. Because of the fact that climatic observations can be

accumulated only slowly, it is clear that it will be necessary to continue the program of observations at Point Barrow for a number of years before the expected results can be obtained from the research study.

FINAL REPORT, by Pauline M. Austin. Rept. for 1 Mar 56-30 Nov 57 on Weather Radar Research, Contract DA 36-039-sc-71136. 31 Dec 57, 27p. AD-153 903.
Order from LC mi$2.70, ph$4.80 PB 147 387

The basic purpose of this project is to conduct a program of experimental and theoretical research in the field of weather radar. This program includes evaluating the radar as a meteorological instrument, devising and testing additional instrumentation for meteorological observations, and taking observations and using them in meteorological research. Major aspects of the research are, therefore, instrumentation, observation, analysis of data and pursuance of related theoretical studies.

New York U. Coll. of Engineering, N. Y.
ON THE VERTICAL PROPAGATION OF A DISTURBANCE THROUGH THE MESOSPHERE, by Katsuyuki Ooyama. Scientific rept. no. 6 on Contract AF 19(604)1738. Sep 58, 77p. 14 refs. AFCRC-TN-58-499.
Order from LC mi$4.50, ph$12.30 PB 137 835

The vertical propagation of a hydrodynamical disturbance, in which the latitudinal variation of the Coriolis parameter is the only cause of wave propagation, is studied in connection with possible solar-weather relationships. The effect of a vertically variable stratification in the mesosphere on the vertical transmission of the disturbance is first examined. Then, the three-dimensional Green's function of the Rossby wave equation with constant coefficients is derived by making use of the method of stationary phase, and the energy propagation is discussed. Relative accumulation of the energy along the forerunner of disturbance, which proceeds in all directions from the initial point source of the disturbance with the maximum group velocities for the respective directions, is shown to take place. However, within several weeks after the initial disturbance, the forerunner does not become well developed; and the energy density propagated with the maximum group velocity is insignificant when compared with that propagated more slowly, if the size of the initial disturbance is within the range considered here. The speed of the maximum disturbance is found to depend to a great extent on the initial size. The estimate of possible magnitudes of such a disturbance, which might be induced by a corpuscular stream in the high atmosphere and propagated downward, is given in terms of the vertical velocity. (Author)

Operations Research, Inc., Silver Spring, Md.
THE SCATTERING OF THERMAL RADIATION BY CLOUDS, by Donald A. Melnick and J. K. Bragg. Scientific rept. no. 2 on Contract AF 19(604)1422. 4 Dec 57, 25p. 4 refs. Technical paper no. 6.
Order from LC mi$2.70, ph$4.80 PB 137 560

This paper is a summary of certain theoretical results on the transmission of thermal radiation. In the first part, a solution to the problem of transmission of thermal radiation through a layer of scattering particles is derived by two approximation methods. The result is given as a function of angle of incidence, and a scattering parameter of the medium. Although approximate, this solution is more accurate than the precision of measurements which can usually be made in the field or in the laboratory. The second part contains certain practical but less exact approximations necessary to apply these results to the problem of scattering of radiation by clouds. (Author)

Radiobiological Lab., U. of Texas, Austin.
A CORRELATION ANALYSIS OF THE RELATIONSHIP BETWEEN WEATHER VARIABLES AND ATMOSPHERIC RADIOACTIVITY, by J. A. Davis, Loren C. Logie (School of Aviation Medicine) and others. Feb 60, 8p. 8 refs. AFSAM rept. 60-35.
Order from LC mi$1.80, ph$1.80 PB 147 457

Correlation analysis between various surface weather parameters and samples of atmospherically borne radioactive material has been performed. The material collected was primarily of natural origin (i.e., radon and thoron). The analysis suggests that the natural radioactive material is transported into the Austin area within the turbulence associated with a cold frontal passage and concentrated in the lower air layers by the ensuing elevated temperature inversion.

Technical Operations, Inc., Burlington, Mass.
ANALYSIS OF THE PERFORMANCE OF THE AVIATION WEATHER SYSTEM. VOLUME I. SUMMARY, CONCLUSIONS, RECOMMENDATIONS, by Roger F. Willis, Donald Schimelfenyg, and Theodore W. Schwenke. Final rept. on Contract FAA/BRD-39. 30 Dec 59, 71p.
Order from OTS $2.00 PB 161 751-1

The conclusions and recommendations are based on a time analysis of the aviation weather system and a study of the effect of age on the credibility of weather information. The aviation weather system, as studied, includes the weather services provided by the U.S. Weather Bureau, the Air Force, the Navy, and the airlines, with emphasis on aviation operations over the continental United States. The conclusions and recommendations are based on the information presently available on such variables as the number of forecast centers in the system, the number and types of airports and air bases, the weather information traffic load, and the configuration of the teletype networks.

Technical Operations, Inc., Burlington, Mass.
ANALYSIS OF THE PERFORMANCE OF THE AVIATION WEATHER SYSTEM. VOLUME II. DISTRIBUTION OF WEATHER INFORMATION; AGE ANALYSIS OF WEATHER INFORMATION; OBSERVATION PROCESS AND INSTRUMENTS; COMMUNICATION SYSTEMS; [and] CREDIBILITY OF WEATHER INFORMATION, by Roger F. Willis, Donald Schimelfenyg, and Theodore W. Schwenke. Final rept. on Contract FAA/BRD-39. 31 Jan 60, 283p. 98 refs.
Order from OTS $4.00 PB 161 751-2

This volume contains details supporting the conclusions and recommendations of volume 1 (PB 161 751-1)

AIRFIELDS ON FLOATING ICE SHEETS FOR ROUTINE AND EMERGENCY OPERATIONS, by Andrew Assur. Preliminary edition, Jan 56, 25p. SIPRE rept. 36.
Order from LC mi$2.70, ph$4.80 PB 147 184

The recommendations, covering only practical field aspects, are based on theoretical work, field experiments, and practical experience of personnel of the Snow Ice and Permafrost Research Establishment. They follow chronologically the procedures necessary for the establishment and maintenance of airfields on ice.

Army Snow Ice and Permafrost Research Establishment, Wilmette, Ill.
ICE FABRICS AND THE UNIVERSAL STAGE, by Chester C. Langway, Jr. Aug 58, 21p. 35 refs. Technical rept. 62; AD-206 681.
Order from LC mi$2.70, ph$4.80 PB 147 185

A universal stage for laboratory and field use [J. Geol. 49:590-598, 1951] is described, and the techniques of ice-fabric studies are reviewed. The new stage is based on the same principle as that of Fedorow for use on a polarizing petrographic microscope and has 4 axes of rotation. Three of the axes are graduated, one serving as an azimuth control, the other 2 for recording the angle of inclination. The 4th axis allows the entire stage to be rotated on a vertical axis without disturbing the oriented specimen. The stage is mounted between 6-in. disk polaroids and can accommodate a thin section up to 5 in. in diam. The plastic cover plate is etched with a 1-cm grid for direct grain-size measurements and is equipped with a small copper indicator for obtaining azimuth positions. (Author)

COLLECTION OF STATISTICAL DATA FOR METEOROLOGICAL STUDIES OF THE UPPER ATMOSPHERE, by P. Beelitz, J. Clauss, and W. Fett. Technical (scientific) note no. 1 on Contract AF 61(052)156. 31 July 59, 44p. 19 refs. AFCRC-TN-59-610; AD-231 784.
Order from LC mi$3.30, ph$7.80 PB 146 817

Nocturnal radiosonde ascents were collected, checked and supplemented for the winter months January, February and March 1955 through 1958 from 56 selected aerological stations in Europe and adjacent areas. As the result, data of pressure height, temperature and wind for the standard pressure levels 700, 500, 300, 200, and 100 mb. as well as the surface data and sea-level pressure are given in a complete form on punched cards, lists and microfilms. The methods and means employed are described. Besides comments on the sources of data and the description of working operations, the synoptic-aerological criticism of the data and the developed scientific-technical resources are given in more detail. The experiences with the individual radiosonde networks are pointed out. A selection of scientifically and methodically interesting printing samples illustrates the methods used. (Author)

Ionosphere Research Lab., Pennsylvania State U., University Park.
FINAL REPORT FOR 1 JANUARY 1955 TO 31 AUGUST 1958, by A. H. Waynick. Rept. on Ionospheric Research, Contract AF 19(604)1304. 30 Sep 58, 56p. 242 refs. AFCRC-TN-58-247.
Order from LC mi$3.60, ph$9.30 PB 137 685

Research included theoretical and experimental investigations on the physics, dynamics and general properties of the ionic layers of the earth's atmosphere. The problems outlined fit under the broad categories of recording programs, electromagnetic studies, solar and high atmosphere physics, ionospheric phenomena and equipment development. Brief descriptions of related work supported by other agencies are included in this portion of the report. Four investigations completed or modified prior to June 1957 complete this material.

Michigan U. [Research Inst.] Ann Arbor.
A RADIOACTIVE-IONIZATION-GAGE PRESSURE-MEASUREMENT SYSTEM, by N. W. Spencer, R. L. Boggess and others. Scientific rept. ES-1 on Contracts AF 19(604) (545, 1511, 1948) and National Science Foundation Grant Y/10.20/249. May 58, 66p. 6 refs. 2597-3-S; AFCRC-TN-58-422; AD-152 590.
Order from LC mi$3.90, ph$10.80 PB 146 501

An air-pressure-measurement system employing a radioactive ionization gage has been developed for use in rockets for the determination of surface pressures which can be interpreted in terms of the ambient pressure, density, and temperature of the atmosphere. The system has proven useful for the measurement of pressures from atmospheric to at least 10^{-3} mb. (Author)

A RESEARCH PROGRAM FOR MARINE GROWTH PREVENTION BY ULTRASONICS, by C. W. Waldvogel and J. W. Pieczynski. Rept. for Nov 58-Mar 59 on Contract NOa(s) 56-910-C. May 59, 51p. ER 10764; AD-219 982.
Order from LC mi$3.60, ph$9.30 PB 147 155

A test program was conducted to determine the effectivity of ultrasonics on marine growth. This program utilized ultrasonic vibrations on two 14-ft aluminum hulls in conjunction with two similar boats as controls. For each test, two boats were used, one hull was ultrasonically vibrated, and the other used as a means to determine the amount of growth without vibration. The cleanliness of the ultrasonically vibrated boat hull on all four tests indicates that ultrasonic vibration is effective against marine growth.

Narragansett Marine Lab., U. of Rhode Island, Kingston.
BIOLOGICAL PRODUCTIVITY PROJECT, by David M. Pratt and Harold Berkowitz. Annual progress rept. for 1 Jan-31 Dec 57 on Contract Nonr-396(03). Jan 58, 9p. Reference no. 58-2.
Order from LC mi$1.80, ph$1.80 PB 138 283

Growth rates of the quahog, Venus mercenaria L., in Narragansett Bay have been studied over a three-year period in relation to various environmental factors.

NEW INHALATION VALVE FOR USE WITH A-13A OXYGEN MASK, TEST AND EVALUATION OF, by E. L. Michel. Final rept. 6 June 56, 13p. TED NAM AE-5166; NAmC-ACEL-286; AD-117 563.
Order from LC mi$2.40, ph$3.30 PB 146 508

The inhalation valves presently incorporated in the A-13A oxygen mask have been cause for considerable concern because of their extreme sensitivity to dirt or other foreign material. This condition which could render oxygen masks inoperable during flight poses a definite hazard to pilots. A new design inhalation valve has been developed by Ensigns R. K. Sutz and L. S. Schonberger, which endeavors to eliminate any mask failures which could be caused by this condition. Results of tests conducted indicate that the subject valves do operationally comply with the requirements specified in specifications MIL-V-7553(ASG).

Ballistic Research Labs., Aberdeen Proving Ground, Md.
A PHOTOMETEORONIC METHOD FOR BOMB BALLISTICS AND FOR MEASUREMENTS OF THE FLIGHT PERFORMANCE OF AIRCRAFT, by R. S. Zug. 26 Sep 42, 94p. Rept. no. 279.
Order from LC mi$5.40, ph$15.30 PB 146 948

The Photometeoronic method utilizes two vertical cameras mounted at opposite ends of a suitable base line. An airplane carrying a flashing light flies by night (or by day, with special equipment) at any desired altitude and between the two cameras each of which records the successive images of the flashing light on a photographic plate. Coincident with each flash a radio signal from the airplane is received and recorded at a ground station, for timing purposes. In range bombing the instant of bomb release is signified by a special flash and radio signal. The data from the photographs and time records yields the course and speed of the plane with high percision, as a function of time.

Boeing Airplane Co. [Seattle, Wash.]
WATER VAPOR PUMP STUDY, by John R. Malcolm. Rept. on Contract AF 33(616)5724. Feb 60, 136p. 10 refs. WADC Technical rept. 59-254.
Order from OTS $2.75 PB 161 705

This report presents the results of a study to determine the feasibility of utilizing a water vapor pump to lower the vapor pressure of a water heat sink to obtain water boiling temperatures in the 40° - 70°F and the 120° - 160°F range, for application in aircraft covering the speed range from Mach 1.5 to 12 and altitude range from sea level to 150,000 feet. The criteria of feasibility was: (a) Can water vapor pumps be built in the size range of interest? (b) What penalty results to the vehicle and how does this penalty compare with alternate methods of absorbing the heat load? The pump types considered are the rotary positive displacement, centrifugal, axial flow and ejectors. Centrifugal compressors, both alone and in combination with an expendable ammonia system, and ejectors combined with an ammonia system are feasible for producing 40° - 70°F boiling on bombers with a flight time in excess of 3 hours. No vapor pumps studied are competitive with alternate schemes for providing a heat sink with 120° - 160°F boiling. (Author)

Chicago Midway Labs., U. of Chicago, Ill.
DETERMINATION OF FACTORS GOVERNING SELECTION AND APPLICATION OF MATERIALS FOR ABLATION COOLING OF HYPERVELOCITY VEHICLES, by John H. Bonin, Channon F. Price, and Henry Halle. Rept. on Materials Analysis and Evaluation Techniques, Contract AF 33(616)5436. Feb 60, 162p. WADC Technical rept. 59-87, pt. 3.
Order from OTS $3.00 PB 161 702

The results obtained from tests of samples of fifty-two different materials are presented. The samples were exposed to the high-temperature plasma discharge produced in an air-stabilized electric arc. The sample shape, test conditions and test procedure, and the material behavior are reported upon. (Author)

ANALYZING THE STEPLESS PLANING BOAT, by Eugene P. Clement. Nov 56, 42p. 8 refs. Research and development rept. 1093.
Order from LC mi$3.30, ph$7.80 PB 147 036

This report gives methods of presenting and using information on the hull forms and model performance of planing boats to guide the design of future boats. The effects on performance of variations in some of the primary planing boat parameters are illustrated and discussed. A design method is proposed, and data are presented to assist in making correct design decisions. (Author)

Douglas Aircraft Co., Inc., Long Beach, Calif.
COOLING METHODS AND EQUIPMENT FOR SUPERSONIC AIRCRAFT, by G. B. Werth, H. K. McCluer, and B. T. Fitchett. Rept. for 15 May 56-15 Nov 57 on Contract AF 33(616)3723. Feb 60, 159p. 152 refs. WADC Technical rept. 57-619; AD-151 141.
Order from OTS $3.00 PB 161 731

Methods of cooling the cabin and equipment that were considered include (1) air cycle, vapor cycle and absorption cycle refrigeration, (2) rejection of heat to expendable coolants, and (3) relatively unexplored

methods such as vortex tubes, thermoelectric cooling and endothermic reactions. Twenty-eight cooling systems were conceived and analyzed, all of which are classified as storage systems. Six of the more promising systems were evaluated to determine the drag horsepower attributable to each. Further, the design and development problems associated with these systems were evaluated. Storage cooling systems using fuel and water as heat sinks were found to to be the most promising systems investigated.

Flight Control Lab., Wright Air Development [Div.] Wright-Patterson AFB, Ohio.
INVESTIGATION OF A TECHNIQUE FOR IMPROVING AIRCRAFT RESPONSE USING A COMPLEMENTARY OPTIMUM-RESPONSE MODEL, by Raymond R. Rath. Sep 56, 81p. 3 refs. WADC Technical note 56-475; AD-110 518.
Order from LC mi$4.80, ph$13.80 PB 147 591

The pitch response of an F-89 aircraft to a command input is investigated using the two-degree of freedom short period mode approximation. The command input is fed into both the airframe-hydraulic servo combination and a black box represented by an "ideal" transfer function of the same order as the airframe transfer function. The two outputs are compared and some function of the difference is fed back to the input of only the airframe-servo system. Several feedback configurations are investigated by means of root-locus techniques. The response of the system with a particular feedback function is determined analytically for seven different flight conditions covering the flight regime of the F-89. A computer solution is then obtained for these seven conditions and the "best" fixed gain for all conditions is determined. The results show that the response of the airframe to a command input remains very close to the response of the "ideal" transfer function. (Author)

General Applied Science Labs., Inc., Westbury, N. Y.
NOTE ON THE BROAD SPECTRUM NOISE OF A JET AND ITS SILENCER, by Sin-I Cheng. Rept. on Contract AF 49(638)194. Nov 59, 24p. 9 refs. GASL Technical rept. no. 149; AFOSR-TN-59-1309.
Order from LC mi$2.70, ph$4.80 PB 147 320

In this note, it is intended to amplify some of the implications of the model for analyzing the broad spectrum noise of a jet as was presented in a previous report when applied to practical systems. Experimental results on the noise reduction by the C. F. 100 Orenda IIR diffuser silencer and by the UTIA Model Ground Muffler are discussed from the points of view of both the Lighthill's model and the present model. Based upon Lighthill's model, it appears necessary to assume a very large increase of the turbulence intensity accompanying the diffusion of the jet velocity. According to the present model, where the change of the turbulence intensity is neglected, the observed noise reduction or increase is explained by the change of the relative thickness of the shear layer that appears to be of reasonable magnitudes. (Author)

Heat Transfer Lab., U. of Minnesota, Minneapolis.
EXPERIMENTAL STUDIES FOR DETERMINING HEAT TRANSFER ON THE RIBBONS OF FIST TYPE PARACHUTES, by P. A. Schoeck, J. N. Hool, and E. R. G. Eckert. Rept. on Contract AF 33(616)3755. Feb 60, 103p. 13 refs. WADC Technical note 59-345.
Order from OTS $2.50 PB 161 745

Experimental heat transfer studies were conducted on models representing the ribbons of Fist type parachutes. The measurements were made in the Reynolds number ranges from $.03 \times 10^5$ to $.6 \times 10^5$ and from 2.5×10^5 to 5×10^5 where the Reynolds number is based on ribbon width and on the average velocity and properties in the slots between the ribbons. Low ratios of the pressures upstream and downstream of the models were connected with the small Reynolds number tests and high pressure ratios with the large Reynolds number experiments. The effect of ribbon spacing (porosity) upon the heat transfer was investigated. The data are presented in dimensionless form. The data can be used for the prediction of convective heat transfer rates on Fist type parachutes during descent. (Author)

Hiller Aircraft Corp., Palo Alto, Calif.
DUCTED PROPELLERS: A CRITICAL REVIEW OF THE STATE OF THE ART, by A. H. Sacks and J. A. Burnell. Rept. on Contract Nonr-2677(00). 26 June 59, 74p. 124 refs. Rept. no. ARD-232.
Order from LC mi$4.50, ph$12.30 PB 146 404

A critical survey is made of the state of the art of ducted propellers. The survey is divided generally into theoretical and experimental research, and a comprehensive table of the latter is presented showing the type and extent of experimental investigations carried out. Specific reports are discussed where appropriate, and various aspects of the ducted propeller problem are considered in some detail. A summary of the state of the art is presented along with some recommendations for future research. (Author)

AIRPORT MARKING AND LIGHTING SYSTEMS: A SUMMARY OF OPERATIONAL TESTS AND HUMAN FACTORS, by William A. Lybrand, W. S. Vaughan, Jr., and John P. Robinson. Final rept. on Contract FAA/BRD-13. May 59, 230p. 20 refs. HSR-RR-59/1-MK.
Order from OTS $3.50 PB 161 750-1

Contents:
Chap. 1. Introduction
Chap. 2. Operational test results from Arcata to Dow
Chap. 3. Flight mode analysis of AML functions
Chap. 4. Outline of recommended research and development
Technical note 1. AML as system design and research and development problems
Technical note 2. The nature of the pilot's task
Technical note 3. Information requirements derived from analysis of the pilot's task
Technical note 4. The information required for the

visual control of aircraft landings
Technical note 5. Implications of accident and pilot reaction time data for AML design
Technical note 6. Determinants of intensity and positioning of approach and runway lighting
(For a condensed version directed to the general non-technical reader see PB 161 750-3)

Human Sciences Research, Inc., Arlington, Va.
AIRPORT MARKING AND LIGHTING SYSTEMS: A SUMMARY OF OPERATIONAL TESTS AND HUMAN FACTORS, by William A. Lybrand, W. S. Vaughan, Jr., and John P. Robinson. Final rept. appendix (with selected annotations and bibliography) on Contract FAA/BRD-13. May 59, 415p. 653 refs. HSR-RR-59/1-MK.
Order from OTS $6.00 PB 161 750-2

This volume contains summaries and references of published reports on airport marking and lighting and related topics. It can be used as a catalog of information about airport marking and lighting to aid airport design engineers and FAA research personnel in identifying and locating reports. (See also PB 161 750-1)

Human Sciences Research, Inc., Arlington, Va.
AIRPORT MARKING AND LIGHTING SYSTEMS; A SUMMARY OF OPERATIONAL TESTS AND HUMAN FACTORS, by William A. Lybrand, W. S. Vaughan, Jr. and John P. Robinson. Condensed rept. on Contract FAA/BRD-13. May 59, 31p. 13 refs. HSR-RR-59/6-MK.
Order from OTS $1.00 PB 161 750-3

This report is a condensed version of HSR-RR-59/1-MK (PB 161 750-1). It is intended for non-technical readers in management or supervisory positions in the aviation industry, and in pertinent government agencies and departments. It describes, within a few minutes reading time, what is known now and what needs to be learned and developed in operational airport marking and lighting.

Flight Control Lab., Wright Air Development [Div.] Wright-Patterson AFB, Ohio.
A SUMMARY OF TRIM SYSTEM PROBLEMS, INVESTIGATIONS, CONSIDERATIONS, AND CORRECTIVE ACTIONS, by Richard Hollingsworth. Aug 58, 46p. WADC Technical rept. 58-439; AD-155 802.
Order from LC mi$3.30, ph$7.80 PB 147 580

The various types of trim systems and their operational characteristics are defined. The most significant and recent of the trim system investigations are briefly reviewed. Many aspects of trim system and component design are discussed to illustrate potential problem areas and present possible solutions to problems which are encountered. A brief outline of investigative procedures is presented. Recommendations are given which will assist in achieving the maximum possible degree of safety in trim systems. (Author)

Materials Lab., Wright Air Development Div., Wright-Patterson AFB, Ohio.
ROLE OF STRUCTURAL DAMPING IN ACOUSTICAL FATIGUE, by W. J. Trapp and B. J. Lazan (U. of Minnesota). Rept. on Materials Analysis and Evaluation Techniques and reprint of "Acoustic Fatigue and Damping", presented at 26th Shock and Vibration Symposium, San Diego, Calif., 22 May 58. Jan 60, 31p. 7 refs. WADC Technical rept. 59-304.
Order from OTS $1.00 PB 161 742

Techniques proposed to reduce or eliminate materials fatigue damage due to high level noise fields of propulsion systems and aerodynamically induced pressure fluctuations are discussed. The mechanisms, the significant parameters involved and the response of materials and structures are analyzed. The activities undertaken and notions on the solution of the problem by employing certain damping concepts are presented. (Author)

National Research Labs., Ottawa (Canada).
BRIEF EXPERIMENTS ON A FLAPPED AEROFOIL HAVING A CUSPED CAVITY AND A BLOWING JET AT THE CUSP, by A. D. Wood. Dec 59, 22p. 4 refs. Aeronautical rept. LR-269.
Order from LC mi$2.70, ph$4.80 PB 147 332

Experiments on a simple flapped aerofoil incorporating a cusped cavity and having a blowing jet at the cusp show that it is possible to produce a flow regime in which the cavity is occupied by a stable trapped vortex. With the aerofoil immersed in a quasi-two-dimensional finite stream, greater rotation of the resultant force vector was obtained with a flap of this type than with a flap having no cavity. The results indicate that the combination of a blowing jet and a trapped vortex may be used to advantage in enabling an external flow to overcome an adverse pressure gradient. (Author)

Naval Weapons Lab., Dahlgren, Va.
FEASIBILITY STUDY OF SHAPED CHARGE SEPARATION OF THE AIRCRAFT FLIGHT CAPSULE, by G. W. Baker, M. E. Conlon and others. Final rept. for Aug 59-25 Mar 60. 11 May 60, 70p. NWL rept. no. 1704.
Order from LC mi$3.90, ph$10.80 PB 147 123

In support of the Navy Integrated Flight Capsule study, the feasibility of completely severing service aircraft fuselages, in air and underwater, reliably and with acceptable side effects, was established using prototype flexible linear shaped charge installations. Design, installation and maintenance characteristics are described, component and system tests summarized, system reliability analyzed and factors determining feasibility evaluated. (Author)

Polytechnic Inst. of Brooklyn, N. Y.
FORCED FLEXURAL VIBRATIONS OF SANDWICH PLATES IN PLANE STRAIN, by Yi-Yuan Yu. Technical note no. 4 on Contract AF 49(638)453. July 59, 23p. 7 refs. AFOSR-TN-59-567.
Order from LC mi$2.70, ph$4.80 PB 146 974

On the basis of the new flexural theory of elastic sandwich plates the problem of general forced flexural vibration in the plane-strain case is solved. The results are made use of in solving the problem of a simply supported sandwich plate in plane strain with one of the two end sections prescribed a transverse deflection varying with time.

Princeton U., N. J.
PRELIMINARY FLIGHT EXPERIMENTS WITH THE PRINCETON UNIVERSITY TWENTY-FOOT GROUND EFFECT MACHINE, by W. B. Nixon and T. E. Sweeney. Rept. on Contract DA 44-177-TC-524. Jan 60, 25p. Dept. of Aeronautical Engineering rept. no. 506.
Order from LC mi$2.70, ph$4.80 PB 146 759

This paper deals with measurement of control moments and rates, drawing a comparison with the controllability of a HUP-1 helicopter. Fundamental flow studies are discussed and illustrated by means of diagrams and tuft pictures. Full scale drag measurements are reported and the problem of momentum drag is discussed and shown to be a function of the flow change over the machine's surface produced by the sink. Full scale lift augmentation ratios as a function of the height parameter are presented and compared with those of a 1/12 scale model. The results of hovering performance studies are reported and compared to Chaplin's simple momentum theory. Over-all handling characteristics are discussed and observations of the machine's performance over rough and smooth surfaces and snow are included. (Author)

Rensselaer Polytechnic Inst., Troy, N. Y.
A THEORETICAL EVALUATION OF THE COANDA NOZZLE, by Kuo-Tai Yen. Rept. on Contract AF 18(600)992. 5 July 55, 32p. 7 refs. TR AE5501; [AFOSR-TN-55-253] AD-84 518.
Order from LC mi$3.00, ph$6.30 PB 147 161

An investigation of the Coanda Effect as applied to a two-dimensional nozzle (Coanda Nozzle) with a bend attached to one side of its exit is made in this report. By considering a perfect fluid, theoretical analysis shows that an appreciable mass flow rate increase is obtained when the flow follows the bend and is deflected. Theoretically, the sharper the corner at the bend, the longer the bend attached to the nozzle, and the longer the overhang, the larger the mass flow rate which can be obtained. In particular, the best theoretical result is obtained when the bend is sharp-edged. If the viscous effect of the fluid is considered, the Coanda phenomenon, although theoretically sound, is difficult to put into practical use. Unless effective and positive boundary layer control can be devised and applied, the "Coanda nozzle", in its present form, seems to be limited in its practical value. (Author)

Research, Inc. [Hopkins, Minn.]
INVESTIGATION OF WINDSHIELD RAIN REMOVAL METHODS FOR RE-ENTRY TYPE VEHICLES, by Harry R. Meline and Dennis H. Andersen. Rept. on Contract AF 33(616)5831. Feb 60, 206p. 5 refs. WADC Technical rept. 59-690.
Order from OTS $3.50 PB 161 722

This report contains the results of a study and wind tunnel test program conducted to investigate methods of improving windshield visibility during landing under rain conditions. The investigation was directed towards systems which would be applicable to hypersonic boost-glide vehicles or manned satellites using aerodynamic lift for re-entry speed reduction and landing. Various methods were studied and potential systems were wind tunnel tested under simulated rain conditions to experimentally investigate and demonstrate the effectiveness of the more promising methods. Systems were evaluated on the basis of visibility improvement, weight and space penalty, complexity, and reliability. Data are presented in the form of sketches, curves, and photographs to illustrate the effectiveness of the various systems. The results indicated that several of the methods tested could provide satisfactory improvement of windshield visibility under rain conditions during landing and would be feasible for installation on this type of vehicle. The most desirable systems, however, did exhibit certain inherent limitations and disadvantages. (Author)

DEVELOPMENT OF A UNIVERSAL AUTOMATIC FLIGHT CONTROL SYSTEM. Quarterly progress rept. no. 1, Apr-July 58, on Contract DA 36-039-sc-75040. Aug 58, 19p. 2 refs. Rept. no. 3263-3768.
Order from LC mi$2.40, ph$3.30 PB 147 407

A theoretical discussion of the design considerations of the differential required for the helicopter system is presented. Applicable design equations and criteria are developed. (Author)

Sperry Phoenix Co., Ariz.
DEVELOPMENT OF A UNIVERSAL AUTOMATIC FLIGHT CONTROL SYSTEM. Quarterly progress rept. no. 2, 1 July-1 Oct 58, on Contract DA 36-039-sc-75040. Oct 58, 45p. 4 refs. Rept. no. 1260-0001.
Order from LC mi$3.30, ph$7.80 PB 147 408

A theoretical and practical discussion of potentiometer power supplies, and signal demodulator is presented. Schematic diagrams of the components are provided, together with parts data pertinent to reliability analysis. The mathematics and concepts of reliability prediction are explained and applied to significant power supply and demodulator components. Mathematical formulae are presented in exposition of the applied theory. Component failure data from a variety of sources is presented, correlated and evaluated. (Author) (See also PB 147 407)

Sperry Phoenix Co., Ariz.
DEVELOPMENT OF A UNIVERSAL AUTOMATIC FLIGHT CONTROL SYSTEM. Quarterly progress rept. no. 3, 1 Oct 58-1 Jan 59, on Contract DA 36-039-sc-75040. 31 Jan 59, 88p. 2 refs. Rept. no. LJ-1260-0001-3.
Order from LC mi$4.80, ph$13.80 PB 147 409

The RPM control system for helicopters is reviewed in the light of the development of new simplifying concepts and of completion of flight tests of a Sperry RPM Control System developed for the Air Force. The ability to meet the requirements of SCL 1868 with a significantly simplified system is demonstrated. A discussion of signal switching and interlock functions required in the Universal Automatic Flight Control System is presented. (Author) (See also PB 147 408)

Sperry Phoenix Co., Ariz.
DEVELOPMENT OF A UNIVERSAL FLIGHT CONTROL SYSTEM. Quarterly progress rept. no. 4, 1 Jan-31 Mar 59, on Contract DA 36-039-sc-75040. 30 Apr 59, 115p. 3 refs. Rept. no. LJ-1260-0001-4.
Order from LC mi$6.00, ph$18.30 PB 147 410

The results of a computer study of the pitch axis performance of the Universal Automatic Flight Control System (AFCS) and AO-1 aircraft are reported. It is shown that the universal AFCS is capable of stabilizing the pitch atitude of the aircraft well within the requirements of SCL 1870 in the presence of a ten knot step vertical gust. Other subjects investigated in this study include altitude control and the effects of servo dead zone. Analysis of the helicopter RPM System also continued during the past quarter. Controller characteristics are combined with the dynamics of the H-34 helicopter in this report to show the ability of the RPM system to stabilize the helicopter in the case where the rotor is very lightly loaded. (Author) (See also PB 147 409)

Sperry Phoenix Co , Ariz.
DEVELOPMENT OF A UNIVERSAL AUTOMATIC FLIGHT CONTROL SYSTEM. Quarterly progress rept. no. 5, 1 Apr-30 June 59, on Contract DA 36-039-sc-75040. 31 July 59, 50p. 2 refs. Rept. no. LJ-1260-[0001]-5.
Order from LC mi$3.30, ph$7.80 PB 147 411

The installation of the first engineering test model of the Universal Automatic Flight Control System in Sperry's S-55 helicopter is described. General installation requirements are reviewed, and the approach toward meeting these requirements in the S-55 helicopter is discussed. (Author) (See also PB 147 410)

Sperry Phoenix Co., Ariz.
DEVELOPMENT OF A UNIVERSAL AUTOMATIC FLIGHT CONTROL SYSTEM. Quarterly progress rept. no. 6, 1 July-30 Sep 59, on Contract DA 36-039-sc-75040. 31 Oct 59, 101p. 3 refs. Rept. no. LJ-1260-0001-6.
Order from LC mi$5.70, ph$16.80 PB 147 412

The results of a computer study of the Automatic Flight Control System AN/ASW-12(V) controlling the YAQ-1 aircraft are reported. The study indicates that the system is capable of satisfying the Signal Corps Technical Requirement 1870 over a range of flight conditions extending from approach speed to maximum indicated air speed at sea-level. Results are reported in terms of the servo system calibration for each axis. The simulation utilizes deliverable servo system calibration for each axis. The simulation utilizes deliverable servo systems (i.e. Electro-Mechanical Rotary Actuators). (Author) (See also PB 147 411)

Ultrasonic Testing and Research Lab.
RESEARCH AND DEVELOPMENT LEADING TO THE ESTABLISHMENT OF ULTRASONIC TEST STANDARDS FOR AIRCRAFT MATERIALS, by G. L. Cross, R. E. Kleint, and R. D. McKown. Rept. for June 58-June 59 on Materials Analysis and Evaluation Techniques, Contract AF 33(616)5877. Feb 60, 147p. 10 refs. WADC Technical rept. 59-466.
Order from OTS $2.75 PB 161 753

The report contains results of a four phase study of materials and techniques concerning the evaluation of internal flaws by ultrasonic means. The four questions studied were: what material variables affect the transmission of ultrasonic compressional waves in certain aircraft materials; what material and geometrical variables affect transmission of shear and surface waves in thin sheet materials; what are the quantities involved when altering the beam diameter by collimation; and, what correlation exists between the ultrasonic and mechanical properties of materials which contain quantities of minute porosity. (Author)

DESIGN AND TESTS OF AERODYNAMIC STATIC PRESSURE COMPENSATORS FOR FOUR SERVICE AIRCRAFT, by Frederick O. Smetana. Rept. on Contract AF 33(600)36143. May 59, 43p. WADC Technical rept. 59-383; AD-233 999.
Order from LC mi$3.30, ph$7.80 PB 147 872

Aerodynamic static pressure compensators, the necessary shortened nose booms, pitot-static tubes, and Mach switches have been developed for four types of service aircraft. These devices permit the sensing of free stream pressure to within .015 q_c for $M<1.0$ and .01 P for $M>1.0$ with nose booms 1/3 to 1/2 as long as existing production systems. Further work is reported which indicates that the resultant error for $M<1.0$ can be reduced to $0.006q_c$ or less. (Author)

Vertol Aircraft Corp., Morton, Pa.
DEVELOPMENT OF IMPROVED CARGO SLING SYSTEM INCORPORATING LOAD STABILIZATION. ENGINEERING ANALYSIS. Final rept., phase 1, on Contract DA 44-177-TC-587. Mar 60, 78p. 1 ref. R-186.
Order from LC mi$4.50, ph$12.30 PB 146 903

Design and analytical studies were performed to determine optimum configurations of equipment to be used with Army cargo helicopters to improve their capabilities in airlifting standardized Army loads externally. Devices investigated covered all feasible concepts (1) for improving the effective pivot point of the load with respect to the helicopter center of gravity, and (2) for reducing to a minimum the motions of the load with respect to the fuselage. Specific configurations are recommended. (Author)

Winzen Research, Inc., Minneapolis, Minn.
MANHIGH II. USAF MANNED BALLOON FLIGHT INTO THE STRATOSPHERE FLOWN BY DAVID G. SIMONS. Final rept. on Contract AF 29(600)808. June 59, 355p. 49 refs. AFMDC-TR-59-28; AD-230 805.
Order from LC mi$11.10, ph$84.90 PB 146 511

Project MANHIGH II was undertaken to investigate the human factors of space flight. The project sought to (1) discover how man reacts in this hostile environment, (2) learn more of the design principles for space capsules, and (3) how to study man's reactions to permit intelligent planning of future space flight experiments. COLD GAS ATOMIZATION OF LOW VOLATILITY LIQUIDS, by Malcolm G. Gordon. Jan 60, 30p. 8 refs. CWLR-2333; AD-231 235.
Order from LC mi$2.70, ph$4.80 PB 146 859

Bis(2-ethylhexyl)hydrogen phosphite was atomized by compressed air using a device similar in design to a multicompartment thermal generator and equipped with various nozzle configurations. Several different sampling techniques were used as a means of characterizing the aerosol produced. The data obtained were compared to the Nukiyama-Tanasawa equation characterizing the process, and the application of the cold gas technique to a practical munition device was considered.

Army Chemical Warfare Labs., Army Chemical Center, Md.
PROTECTOR, COLLECTIVE, EMD, 75 CFM, E36; FILTER, PARTICULATE, 75 CFM, E37; AND FILTER, GAS 75 CFM, E36R1 (FINAL ENGINEERING TESTS NOS. 115, 134, AND 135) by Paul E. Oliver, James W. Waddey, Jr. and Irving S. Sherman. Jan 60, 49p. CWLR-2335; AD-231 790.
Order from LC mi$3.30, ph$7.80 PB 146 861

Final engineering tests of the E36 75-cfm collective protector, and its component E37 particulate and E36R1 gas filter units, designed to provide protection for AACS shelters during CBR attacks, and to heat and/or ventilate the shelters during normal operation are presented. The test program showed that the prototype unit and its components fulfilled the design characteristics under which it was developed. (Author)

Army Chemical Warfare Labs., Army Chemical Center, Md.
THERMAL ATTENUATION BY CHEMICAL SMOKES, by Jerry J. Mahoney, Douglas D. Keough and David T. Kilminster. Rept. for Apr-June 55 on Thermal Radiation Attenuating Cloud Study. Jan 60, 28p. 12 refs. CWLR 2353.
Order from LC mi$2.70, ph$4.80 PB 147 550

The transmissivity of thermal radiation from a carbon arc through six different smokes was measured at concentrations of from 0 to 5 g/sq m. The smokes were tested to evaluate their capabilities to attenuate thermal radiation from nuclear detonations. (Author)

DEVELOPMENT OF THE ZONE-PURIFICATION PROCESS FOR PREPARING POTABLE WATER FROM SEA WATER, by W. H. Mink, G. F. Sachsel, and R. B. Filbert, Jr. Rept. for 16 June 59-31 Mar 60 on Contract No. 14-01-001-175. 1 June 60, 36p. 2 refs. Saline Water Research and Development Progress rept. no. 39.
Order from OTS $1.00 PB 161 766

As a first step toward obtaining the optimum economic zone-freezing process, the vertical-tube unit was simulated on an analog computer to determine the effect of design parameters on product salinity. With this information plus some additional experimental freezing data, it was possible to show that the optimum vertical-tube unit would require four stages, would freeze 13 per cent of the feed before discharging it, and would require that the temperature difference in the freezing zones be 3 F. Based on these results, it was possible to estimate that the total plant investment for a plant producing 100,000 gallons of potable water per day would be about $2,600,000. The estimated operating cost for a plant this size was found to be about $9.60 per 1,000 gallons of potable water. For a plant designed to produce 10 million gallons of potable water per day, the total plant investment and the daily operating cost were estimated at about $115,000,000 and $4.20 per 1,000 gallons, respectively. It is unlikely that these costs could be reduced further even with major changes in the process.

Feltman Research and Engineering Labs., Picatinny Arsenal, Dover, N. J.
PRESS-FIT CLOSURES FOR 8-INCH T174 CHEMICAL SHELL, by Walter J. Puzia. Mar 60, 24p. Technical rept. 2678.
Order from LC mi$2.70, ph$4.80 PB 145 243

This report presents the results of a study to establish the optimum burster casing wall thickness at the press-fit for the 8-inch T174 chemical shell. Since it is known that leakage of the shell filler is usually associated with "galling," or abrasion, of the press-fit surfaces, it is the objective of this study to determine the burster casing wall thickness which produces the least amount of galling of the press-fit surfaces when assembled. As this study does not cover variations in degree of interference, surface finishes, or entrance radii, these were kept as nearly constant as possible and representative of established practice for shell press-fits. Only the wall thickness was varied. Rate of pressing the parts together and lubrication of surfaces were also representative of actual practice. Traces were made of assembling load versus travel, using electrical strain gage equipment, to determine smoothness of assembling and magnitude of assembling load. The assemblies were then sectioned longitudinally, and the press-fit surfaces were photographed to note the degree of abrasion. (Author)

Naval Research Lab., Washington, D. C.
THE PRESENT STATUS OF CHEMICAL RESEARCH IN ATMOSPHERE PURIFICATION AND CONTROL ON NUCLEAR-POWERED SUBMARINES, by R. R. Miller and V. R. Piatt. Interim rept. 21 Apr 60, 167p. 232 refs. NRL rept. 5465.
Order from OTS $3.00 PB 161 518

A comprehensive report has been written on the past and present research and development effort of the U.S. Naval Research Laboratory on the atmospheric habitability of submarines. Topics covered include atmospheric sampling, analysis and monitoring, the generation of oxygen, and the removal of unwanted components such as carbon monoxide, carbon dioxide,

hydrogen, organic contaminants, and aerosols. Emphasis is given to methods of preventing the gradual buildup of contaminants capable of decreasing the efficiency of the crew or of having deleterious effects on delicate or critical equipment. Future research must emphasize increasing reliability, complete independence of an external supply of oxygen, and more attention to the evolution of an integrated and automatically controlled system. (Author)

Naval Supply Research and Development Facility, Bayonne, N. J.
ULTRASONIC CLEANING, by S. Cholmar and S. Stambler. 20 Nov 58, 67p. 35 refs. Proj. NT003017(j) Engineering rept. no. 2.5064.
Order from LC mi$3.90, ph$10.80 PB 147 146

The technical and economic factors involved in the use of ultrasonic cleaning methods were determined. Ultra sonic cleaning is applicable to the cleaning of small, critical parts and is economical when the savings in labor, solvent costs and the increase in efficiency offset the cost of the ultrasonic cleaning equipment. Criteria developed for the use of ultrasonic cleaning methods can be used by interested activities as a guide in determining the applicability of ultrasonic techniques to their cleaning operations. DEVELOPMENT OF THE SOLVENT DEMINERALIZATION OF SALINE WATER. Rept. on Contracts 14-01-001-77 and 14-01-001-106. Feb 60, 93p. 1 ref. Saline Water Research and Development Progress rept. no. 35.
Order from OTS $2.25 PB 161 769

Solubility and equilibrium data are presented for a variety of solvents of which secondary and tertiary amines appear to have many desirable properties. Use of radioactive sodium and chloride in the equilibrium determinations indicate that for amines the ions do not distribute equally between the phases because of the hydrolysis of these solvents in water. Operational data for the laboratory model of the extraction process are reported. The results were as predicted from the equilibrium and solubility data for the solvents employed, and no unusual operating conditions were encountered. A cost equation is developed to allow rapid evaluation of the results produced by different solvents and by various operating conditions. This equation is used to calculate the cost of two solvents under various conditions. (Author)

TRAPPING OF NOBLE GAS IONS AND THE REEMISSION OF THE TRAPPED ATOMS FROM NICKEL AND MOLYBDENUM, by J. H. Carmichael and J. S. Knoll. [Rept. on Contract AF 18(600)1049] 25 Sep 58, 16p. 4 refs. Scientific paper 6-94439-9-pl; AFOSR-TN-58-971; AD-205 601.
Order from LC mi$2.40, ph$3.30 PB 138 058

The electrical cleanup of noble gases on nickel and molybdenum surfaces has been investigated. The reemission of the trapped atoms has been measured and is shown to be an important factor in the observed saturation of the cleanup process. Pumping speeds and re-emission rates for helium, neon, argon, and krypton have been measured and compared with the phenomenological theory (J. Appl. Phys. 28, 913 (1957)) which had previously been proposed to explain the contribution of re-emission to the pumping process of helium on molybdenum surfaces. (Author)

STRUCTURAL INSTABILITY UNDER TIME-DEPENDENT LOADS, by E. F. Masur. Final rept. on Contract DA 20-018-ORD-14027. June 58, 51p. 10 refs. OOR rept. 1591. 1-E; AD-161 938.
Order from LC mi$3.60, ph$9.30 PB 146 798

Possible definitions of time-dependent stability are discussed. The response of simply supported columns to linearly attenuating lateral and axial forces is computed and charted for a broad variety of parameters, including asymptotic cases. The equations governing columns of other boundary conditions are developed and their solution is indicated. Special sections are devoted to multi-story frames and arches. (Author)

TELEMETRY SYSTEM STUDY, VOLUME I (of I) by C. Harrison Smith, J. W. Capps and others. Semi-annual rept. for 6 Feb-30 Nov 58, on Contract DA 36-039-sc-73182. 31 Dec 58, 112p. 14 refs. ASI Publication no. U-320; AD-213 319.
Order from LC mi$6.00, ph$18.30 PB 147 629

The objectives of the program are: (1) to forecast the individual flight requirements for telemetry at the test ranges in the next decade and the effect of heavy traffic on multiple range operations; (2) to recommend suitable operating frequencies for further telemetry systems; (3) to examine various modulation or coding methods and recommend an optimum technique for future systems; (4) to investigate the performance of present systems and recommend improvements. Experimental telemetry system test setups for a number of modulation systems are presented. A summary of telemetry interference measurements made in the 225-260 mc/s, 1435-1535 mc/s and the 2200-2300 mc/s frequency bands aboard the USS GALVESTON December 2 - 6, 1958 is given, and the results of a transmitter frequency stability study to determine feasibility of .001% operational stability in near-future applications for the 2200-2300 mc/s frequency band is reported.

Air Force Cambridge Research Center, Bedford, Mass.
AN EVALUATION OF THE P-N-P-N NEGATIVE RESISTANCE DIODE, by H. I. Honor. Master's thesis. Mar 59, 39p. 10 refs. AFCRC-TR-59-140; AD-230 945.
Order from LC mi$3.00, ph$6.30 PB 146 446

The operation of the three junction diode is analyzed and interpreted in terms of two contiguous transistors It is seen that avalanche breakdown and the sum of the forward alphas determine the switching characteristics. The properties of four varieties of the diode are presented and comparisons made. A piecewise-linear equivalent circuit is developed. Some simple circuit applications are analyzed. (Author)

SPHERICAL GRIDS FOR ELECTRON TUBES, by George P. Ploetz. Feb 60, 12p. AFCRC-TN-60-160.
Order from LC mi$2.40, ph$3.30 PB 147 508

Hemispheric shaped grids for spherical electron tubes are described. A number of design variations are given. From these basic considerations many special grid designs can be readily visualized and made. (Author)

Antenna Lab., Ohio State U. Research Foundation, Columbus.
CALCULATED VALUES OF SELF AND MUTUAL IMPEDANCES FOR PARALLEL SHORT DIPOLES, by Frank Serracchioli. Rept. on Antenna Phenomena Research, Contract DA 36-039-sc-70174. 24 Mar 59, 84p. 8 refs. Rept. no. 662-23; AD-220 546.
Order from LC mi$4.80, ph$13.80 PB 146 938

Research concerns a study of surface waves supported by Yagi arrays. A large number of self and mutual impedances for center-fed dipoles were calculated by means of an IBM 650-653 B4 digital electronic computer. Although the values obtained do not form a uniform table, i.e., a table in which the parameters vary by constant steps, the information made available by this large number of impedances may be useful whenever a zeroth order approximation is sufficient; hence the values were tabulated in such a way as to make table look-up and interpolation as easy as possible. The formulae used for the calculations are reported and their approximations discussed. Details on the mathematical devices adopted for computer programming are explained. The tabulated results were compared with values given by more advanced theories and with experimental measurements, and a simple correction formula is deduced therefrom. The computer flow chart and the complete machine program, with a brief explanation of the, are included in the appendix. (Author)

Antenna Lab., Ohio State U. Research Foundation, Columbus.
AN EXPERIMENTAL INVESTIGATION OF THE RADIATION PATTERNS OF ELECTROMAGNETIC HORN ANTENNAS, by Donald R. Rhodes. Rept. on Contract W33-038-ac-16520. 22 Sep 47, 26p. 7 refs. Rept. 301-3; ATI 33 451.
Order from LC mi$2.70, ph$4.80 PB 147 126

A fund of radiation pattern design data on electromagnetic horns is provided for applications requiring patterns which have special characteristic shapes. Electromagnetic horn patterns for horns having flare angles up to 50° and horn lengths up to 50 wavelengths are included. Klystron and magnetron oscillators are used for sources of radiation. Consideration is given to frequency limitations which must be placed upon the throat aperture dimensions. References and applications are made to wave guides.

Antenna Lab., Ohio State U. Research Foundation, Columbus.
IMPEDANCE CHARACTERISTICS OF A UNIFORM CURRENT LOOP HAVING A SPHERICAL CORE, by Saburo Adachi. Rept. on Antenna Phenomena Research, Contract DA 36-039-sc-70174. 15 Apr 59, 18p. 4 refs. Rept. 662-26; AD-220 386.
Order from LC mi$2.40, ph$3.30 PB 146 939

The impedance characteristics of a uniform current loop with a spherical core of an arbitrary composition of μ and ϵ were theoretically investigated. The radiation impedance is derived by the emf method in a convenient form as the sum of the self-radiation impedance of an air loop and an additional term due to the reaction between the loop and the sphere which is proportional to the well-known expansion coefficient of a magnetic-type scattered wave from a sphere in an incident plane wave. The first antiresonance frequency was given in the form of a universal curve for a very small uniform current loop with a core of an arbitrary

composition of μ_s and ϵ_s, subject to the condition that the refraction coefficient $N = \sqrt{\mu_s \epsilon_s}$ is extremely large. It should be noted that the above results can be directly applied to the first magnetic-type resonance frequency of a sphere in an incident plane wave. To show quantitative impedance characteristics of a loop with an arbitrary composite core, the radiation impedances for 2 cases, namely $\epsilon_s = 100$, $\mu_s = 1$, and $\mu_s = 100$, $\epsilon_s = 1$, were calculated and compared with an air loop. It is concluded that high-μ core is desirable for a comparatively lower frequency region, and high-ϵ core is rather desirable in an antiresonance frequency region. (Author)

Antenna Lab., Ohio State U. Research Foundation, Columbus.
A MODIFIED HELICAL ANTENNA, by T. S. M. Maclean. Rept. on Antenna Phenomena Research, Contract DA 36-039-sc-70174. 15 Apr 59, 15p. 3 refs. Rept. 662-28; AD-226 742.
Order from LC mi$2.40, ph$3.30 PB 146 940

A study of the modulated helical antenna was begun with the object of applying linear array theory to its operation. It is well known that the optimum pattern which can be obtained from such an array is produced by a Tchebyscheff source distribution along its axis. When applied to a singly fed end-fire array like the helical antenna this entails several aspects which must be considered: (1) the amplitude distribution is no longer uniform, (2) the phase shift between successive elements is greater than that required for satisfying the Hansen-Woodyard condition, and (3) the radiation from turns connecting the adjacent elements has to be superimposed on the Tchebyscheff pattern. A study of the effect of these modifications to the theory of the uniform helix was made, and it is shown that they considerably restrict the possibility of obtaining increased directivity. An incidental outcome of the study, however, is that it is comparatively easy to obtain a pattern with reduced sidelobe level. (Author)

Armour Research Foundation, Chicago, Ill.
DEVELOPMENT OF HIGH ALTITUDE WAVEGUIDES, by Henry Zucker, Charles M. Knop, and Kurt Gutfreund. Rept. on Thermonic and Solid State Electronic Technology, Contract AF 33(600)32202. Feb 60, 115p. 9 refs. WADC Technical rept. 59-741.
Order from OTS $2.50 PB 161 725

The objective was the development of C, X, and Ku band rectangular waveguide components capable of operating at high power levels, at temperatures from -65°C to 250°C, and at altitudes up to 80,000 feet without the use of auxiliary pressurization equipment. The methods investigated to attain this objective were: waveguides completely filled with dielectric, waveguides sealed by means of tapers (continuous and stepped), and waveguides sealed by dielectric windows. The analysis of waveguides completley filled with dielectric indicates that this technique is not suitable because of the excessive attenuation encountered with presently known dielectric materials. Design techniques for broadband dielectric tapers, both continuous and stepped, and for dielectric windows are established, and the experimental data indicates good correlation with the predicted performance. Dielectric windows using glass-reinforced Teflon laminates were selected for the final waveguide components because of the compact nature of this sealing technique. For frequencies above Ku band, the dielectric taper seals are recommended. (Author)

Armour Research Foundation, Chicago, Ill.
IRRADIATION TESTING OF OPERATING ELECTRONIC EQUIPMENT BY FAST NEUTRONS AND GAMMAS, by R. J. Arndt and C. W. Terrell. Final rept. on Contract N62269-253. 30 Apr 58, 41p.
Order from LC mi$3.30, ph$7.80 PB 147 371

The work reported herein consists of a study of the radiation effects of fast neutrons (0.5 ev to about 15 mev) and gamma rays (fission spectrum) on various pieces of aircraft instrumentation. Components studied were: (1) Fuel Gage Vacuum-tube Amplifier and Indicator, (2) Transistorized (germanium and silicon) Servo Amplifier System, (3) 4 inch Diameter Gyro. The Fuel Gage was subjected to a total neutron flux of about 6×10^5 nvt and about 5×10^8R gamma with no adverse electrical effect. Physical damage was evident. Four Transistorized Amplifiers were irradiated in a fast flux of about 1.0×10^{10} n/cm^2/sec. Rapid loss in gain, rapid increase in d.c. current drain, and complete failure occurred when the integrated flux reached about 10^{13} n/cm^2. The silicon diodes were unaffected by the same flux. Studies on the gyro were inconclusive due to equipment failure. (Author)

Army Rocket and Guided Missile Agency, Redstone Arsenal, Ala.
NOISE REDUCTION THROUGH ELASTIC PULSE MODULATION, by Erich Pieruschka. 1 July 58, 29p. 9 refs. Rept. no. 2R29F; AD-205 574.
Order from LC mi$2.70, ph$4.80 PB 147 463

The noise reduction in a new type of transmission system, elastic pulse modulation, is investigated analytically in this study. The signal-to-noise ratio of this system is compared with that of pulse position modulation, the system from which it is derived. The analysis is made both for a single link transmission system and for one in which successive regenerative repeaters are applied. The noise reduction for the case where the position of the pulse in a staircase waveform is transmitted by a binary pulse code group is also investigated. This investigation is then expanded to include the case of a system employing a chain of regenerative repeaters. (Author).

SPECTRUM UTILIZATION OF DORSETT TR-12, RADIATION 3021A26, RADIATION A-3115-2A, TELECHROME 1472A2, FM/FM TELEMETRY TRANSMITTERS, by William E. Castilo, Virgilio Cisneros, and Charles R. Wise. 9 Dec 59, 107p. AFC Rept. no. TM-9-12-59-T; AD-233 395L.
Order from LC mi$5.70, ph$16.80 PB 146 835

The operational characteristics of these four telemetry transmitters were tested to determine the frequency allocation necessary for operation with a minimum of interference. The tests were run by subjecting the units to parameters of supply voltage variation, operating time, simulated altitude, acceleration and vibration, while empirical measurements were made of their frequency stability, modulation sensitivity and power output. In addition interference characteristics (spurious emissions), VSWR and residual FM were tested.

ARC SUPPRESSION FOR RELAY CONTACTS, by Ronald Green and Arthur P. Boylan. 15 Aug 59, 17p. 9 refs. USASRDL Technical rept. 2061; AD-227 716.
Order from LC mi$2.40, ph$3.30 PB 146 934

Various methods of arc suppression for relay contacts are investigated, including RC networks and utilization of semi-conductors. Theoretical considerations are presented and the effects of relay characteristics on the suppression parameters discussed. Results of laboratory experiments, comparing theoretical circuit constants with actual values required for optimum suppression, are reported. Empirical formulae are presented for selection of RC networks and guidelines established for application of semiconductor suppression techniques. (Author)

VOLTAGE SENSITIVE DIODE TUNING SYSTEMS, by Richard S. Tilton and Louis V. Bessen. 15 Apr 59, 26p. 1 ref. USASRDL Technical rept. 2045; AD-220 338.
Order from LC mi$2.70, ph$4.80 PB 146 933

Voltage-sensitive variable-capacitance semi-conductor diodes were investigated for use in tuning systems. Variation of C and Q with voltage and temperature in the 10-80 mc frequency range are reported. Circuits for obtaining straight-line-frequency tuning, tracking of ganged diodes, and temperature compensation are described. (Author)

Arnold Engineering Development Center, Tullahoma, Tenn.
A TRANSISTORIZED GALVANOMETER CURRENT LIMITER, by P. L. Clemens and R. L. Ledford. Rept. on ARO, Inc. Contract AF 40(600)800. Nov 59, 19p. 3 refs. AEDC-TN-59-110; AD-229 206.
Order from LC mi$2.40, ph$3.30 PB 146 763

Design, operating characteristics, and typical applications of a newly developed, transistorized, galvanometer current limiter are described. The limiter, which provides continuously variable adjustment of maximum permissible galvanometer current, has but small effect on other characteristics of the instrumentation system within which it is used (i.e., accuracy, linearity, and frequency response). Use of this galvanometer current limiter permits a decrease of system scale factor, resulting in greater resolution of diminutive data areas, while preventing destructively large galvanometer currents or deflections which might result from occasional extremes of value of the measured parameter. Although intended for use with oscillograph galvanometers, the current limiter is also applicable to other galvanometers and to meter movements as well. (Author)

DEVELOPMENT AND EVALUATION OF ELECTRON TUBE GLASSES RESISTANT TO RADIATION DAMAGE, by G. R. Weinberg. Semi-annual progress rept. no. 1 for 1 May-1 Nov 59 on Contract DA 36-039-sc-78312; Continuation of Contract DA 36-039-sc-75065. [1960] 22p.
Order from LC mi$2.70, ph$4.80 PB 146 943

Dummy bulbs, with and without leads, made of Owens-Illinois 51-26 boron-free glass, of 3% B_2O_3 and 6% B_2O_3 glass and Corning 7052 and 1723 glass were exposed to neutron bombardment of integrated thermal flux of 10^{16} NVT. Some of these enclosures were checked for strain before and after exposure and others were analyzed for gas content after exposure. A few tubes of type 5U4G and 5R4WGA with special envelopes and a few ionization gauge tubes of type VG1A were irradiated along with Cadmium-Aluminum activation foils as dosimeters. Analysis of these foils revealed an apparent discrepancy in integrated dose, amounting to about ten times the assumed dose, thereby casting some doubt on prior quantitative results in this and the previous contract. (Author) (See also PB 146 041)

Cornell Aeronautical Lab., Inc., Buffalo, N. Y.
STUDY OF METHODS OF COOLING SEMICONDUCTOR DEVICES, by Steven K. Morrison and James P. Welsh. Final rept. on Contract AF 30(602)1842. Mar 60, 41p. 230 refs. Rept. no. HM-1247-D-4; RADC-TR-60-23.
Order from LC mi$3.30, ph$7.80 PB 146 874

The following techniques pertinent to cooling of semiconductor devices were investigated: methods of mounting, electrically insulating, and removing the dissipated heat by conduction through metals; methods of mounting, fin areas, configurations and orientation to enhance heat removal by natural convection; methods of mounting, geometry, fin configurations, air velocities, air flow rates, and other parameters pertinent to forced convection; and direct and indirect liquid cooling techniques.

DIPOLE ANTENNAS COUPLED ELECTRICALLY TO A FOUR-WIRE TRANSMISSION LINE TO ACHIEVE CIRCULARLY POLARIZED RADIATION (THEORETICAL AND EXPERIMENTAL STUDIES) by Kun-Mu Chen. Scientific rept. no. 3, series 2 on Contract AF 19(604)4118. 15 Sep 59, 48p. 4 refs. AFCRC-TN-60-127; AD-232 517.
Order from LC mi$3.30, ph$7.80 PB 146 084

Dipole antennas coupled electrically and in a balanced manner to a four-wire transmission line so as to maintain circularly polarized radiation are studied theoretically and experimentally. The configuration consists of a pair of two-wire transmission lines located on the diagonals of a square and driven 90° out of phase. To the lines are coupled many sets of four-dipole antennas arranged symmetrically in planes perpendicular to the transmission lines. If the sets of four-dipoles are separated by a distance of a half wavelength along the transmission line, a circularly polarized radiation with a bilateral end-fire pattern is obtained. By coupling at intervals of a quarter wavelength to the line with a traveling wave, a unidirectional end-fire array may be achieved in the direction along the transmission line. The current, the optimum length of the antenna, the general nature of the coupling, the coupling between additional sets, and the radiation field factor are studied. (Author)

EXPERIMENTAL DETERMINATION OF THE ZERO-CROSSING DISTRIBUTION W(N,T) by Gerald M. White. Technical rept. on Contract Nonr-1866(16). 15 June 57, 33p. Technical rept. no. 265; AD-146 013.
Order from LC mi$3.00, ph$6.30 PB 147 135

A description is given of the additional equipment built to continue the study of zeros of noise (AD-135 934), and the additional data obtained are depicted by graphs. Broadband noise, narrow-band noise and intermediate cases were considered. The experimental curves agree with calculated curves, and the values of W(N,T), the probability of having N zero-crossings in a time interval T, agree with theoretical predictions.

David Sarnoff Research Center, Princeton, N. J.
FEASIBILITY STUDY OF COMPATIBLE SINGLE SIDE BAND TRANSMITTER, by K. H. Powers, C. A. Von Urff, and F. I. Zonis. Final rept. on Contract AF 19(604)4976. 30 Nov 59, 106p. 6 refs. AFCRC-TR-60-103.
Order from LC mi$5.70, ph$16.80 PB 146 083

A new method of generation of a Single Sideband signal has been developed which provides distortionless reception with a square law envelope detector. This unique compatibility is achieved through a new system design rather than a method such as carrier reinsertion. The system has been completely implemented and many tests made. It has been possible to obtain an average of 25 db sideband rejection using band limited while noise as the intelligence; an average of 2% harmonic distortion using single tone as the intelligence with square law detection and an average of 8-10% intermodulation distortion under the same conditions. In particular applications 25-30 db of sideband rejection may not be sufficient. It is possible to pass the signal through a single sideband filter to increase the rejection and at the same time not materially increase the harmonic and intermodulation distortion.

Diamond Ordnance Fuze Labs., Washington, D. C.
A GUIDE TO SELECTION AND USE OF DYNAMIC PRESSURE TRANSDUCERS, by Arthur Hausner. 14 Sep 59, 17p. 8 refs. Technical rept. TR-814; AD-233 007.
Order from LC mi$2.40, ph$3.30 PB 146 137

A survey was made of commercially available dynamic pressure transducers. The more important characteristics of these transducers taken from the manufacturers' literature are grouped according to principle of operation. For each group listed, the names and addresses of representative manufacturers of the transducers are given. Users of dynamic pressure transducers will find the information useful for selecting one which will best serve for a particular measurement. (Author)

Directorate of Flight and All-Weather Testing, Wright-Patterson AFB, Ohio.
MODIFICATION OF NORC TELEMETERING EQUIPMENT, by Robert L. Goff. Rept. by Radiation, Inc., on Contract AF 33(038)22817. June 54, 28p. Technical note WCT-54-36.
Order from LC mi$2.70, ph$4.80 PB 147 582

This modification program resulted in greatly improved functional characteristics and excellent packaging. Radio link signal levels lower than 20 microvolts allow radio interference to be superimposed upon the recorded signal so that information at frequencies greater than 10 cycles is difficult to measure accurately. Tests were conducted to determine system stability. Linearity characteristics of the system chain from transducer to recorder were better than one per cent under ideal video link conditions.

Electronic Defense Lab., Sylvania Electric Products, Inc., Mountain View, Calif.
DETECTION AND MEASUREMENT OF SPURIOUS SIGNALS GENERATED BY MICROWAVE OSCILLATOR TUBES, by R. E. Booth and R. G. Veltrop. Rept. on Contract DA 36-039-sc-73170. 9 Jan 58, 25p. 1 ref. Technical memo. no. EDL-M72; AD-158 646.
Order from LC mi$2.70, ph$4.80 PB 147 132

Two methods of detecting and measuring spurious signals generated by microwave oscillator tubes are given in this report. The first is a point-by-point technique which employs a manually tuned receiver to examine the output of the tube under test. The second is the search receiver technique which uses the tube under test as the swept local oscillator of a receiver. In the latter case, a simulated signal is supplied to the receiver to provide mixing with the spurious signals, if any. Step-by-step procedures are given and the problem of distinguishing between true spurious signals and signals produced by receiver phenomena are discussed. The origin of spurious signals near the main frequency is also discussed and experimental comparison is made with theory. (Author)

Electronic Defense Lab., Sylvania Electric Products, Inc., Mountain View, Calif.
MICROWAVE PHASE SHIFTING BY FERROELECTRIC ELEMENTS, by Howard Diamond. Rept. on Contract DA 36-039-sc-73170. 25 Apr 58, 20p. Technical memo. no. EDL-M134. AD-203 549.
Order from LC mi$2.40, ph$3.30 PB 146 059

Phase shifts have been measured for typical commercial non-linear ceramics placed in a terminating position on a coaxial transmission line. An appendix covering several definitions of ferroelectric properties is included.

Electrical Engineering Research Lab., U. of Illinois, Urbana.
THE APPROXIMATION OF NETWORK FUNCTIONS USING TCHEBYCHEFF POLYNOMIALS, by Shlomo Karni. Technical note no. 12 on Contract AF 49(638)63. 18 Mar 60, 66p. 31 refs. AFOSR-TN-60-342.
Order from LC mi$3.90, ph$10.80 PB 146 920

Approximation is accomplished by expanding the prescribed response function and an assumed network response function in series of Tchebycheff polynomials. Matching a finite number of terms in the two series determines the desired network function, and the error of approximation. The results represent an extension of a method due to Darlington. The extensions include a method for the derivation of Padé approximants from the Tchebycheff polynomials series expansion of the prescribed gain, a procedure for the reduction of network complexity, and a technique for the matching of the power series expansions of the derivative of a prescribed gain function with that of a network function. The theoretical developments are supported by step-by-step procedures for use in design problems. Included are realizability tests, various tabulations, and graphs. The methods are illustrated by the following examples. (1) The equalization of gain distortion resulting from one or more poles on the negative real axis by means of all-pole network functions. (2) A method for the exact equalization of gain distortion in the approximation band. (3) The approximation of the so-called "brick wall" and the linearly decreasing gain functions by means of biquadratic network functions. (4) The reduction of the degree of a given network function. (Author)

Electrical Engineering Research Lab., U. of Illinois, Urbana.
SYNTHESIS OF DOUBLE-TERMINATED ACTIVE NETWORKS, by King Sun Fu. Technical note no. 11 on Contract AF 49(638)63. 4 Mar 60, 32p. 14 refs. AFOSR-TN-60-368.
Order from LC mi$3.00, ph$6.30 PB 146 919

Methods are given for the synthesis of double-terminated active networks for zeros of transmission at zero, infinity, and on the imaginary axis, and also complex zeros of transmission. The network configuration used is a bridge-type active network containing negative impedance converters. (Author)

Electronic Systems Lab., Mass. Inst. of Tech., Cambridge.
TRANSISTORIZED FOUR-SEGMENT COMMUTATOR FOR A DIRECT-CURRENT MACHINE, by Frederick L. Schwartz. Rept. on Contract AF 33(616)3984. Feb 60, 47p. 18 refs. WADC Technical rept. 59-682.
Order from OTS $1.25 PB 161 721

The main features of this electronic commutator are: (a) commutation is performed on the stator windings by means of an eight-switch arrangement; (b) the rotor position signal for controlling the switching operations is obtained from two Hall generators mounted in the air-gap of a separate machine which is rigidly coupled to the shaft of the commutated machine; (c) transistors are used as the switching elements and in the control circuitry; (d) the commutator switches are bilateral, allowing the machine to run either as a d-c motor or generator. A machine using the electronic commutator was successfully run as a d-c motor and generator at an input power level of 240 watts. The electronically commutated machine is capable of running at an input power level of 600 watts. Two sets of slip rings were the only sliding contacts required for the operation of the machine. A comparison between the electronic and mechanical commutator in terms of size, reliability, and efficiency shows that more work must be done, especially on solid-state switching devices, before the electronic commutator will be practical for moderate- and high-power machines. Electronic Tech. Lab., Wright Air Development Div., Wright-Patterson, AFB, Ohio.
PHOTOCATHODE SIGNAL-TO-NOISE LIMITATIONS IN PICKUP TUBES, by Melvin R. St. John. Rept. on Electronic Tubes and Transistors. Feb 60, 25p, WADC Technical note 59-363.
Order from OTS $0.75 PB 161 728

The maximum signal-to-noise ratio of pickup tubes is limited by the noise due to statistical fluctuations in photoemitted electrons. This maximum has not been achieved in any pickup tube because of additional noise introduced into the tube by the scanning beam. This report shows the theoretical maximum signal-to-noise ratio that can be achieved under the specified conditions plus graphical illustrations of several approaches toward achievement of this limit. The treatment is not rigorous, but rather a highlight presentation to convey a better understanding of the problems to be considered when very low light levels are involved. (Author)

Electronic Tech. Lab., Wright Air Development Div., Wright-Patterson AFB, Ohio.
THERMIONIC ENERGY CONVERTER, by Walter L. Knecht. Rept. on Thermionic and Solid State Electronic Technology. Mar 60, 54p. 4 refs. WADD Technical rept. 60-128.
Order from OTS $1.50 PB 161 713

High-vacuum and gas-filled thermionic energy converters are reviewed. Emphasis is placed on the significant phenomena underlying the operation of these two classes of converters. A treatment of fundamental thermionic emitter characteristics is given. The complex variety of simultaneous processes occurring in the plasma of gas-filled converters is illustrated. Principal problem areas existing in the field of both converter types are shown. The present state of the art in this field is discussed in connection with the results obtained with small-sized device samples developed up to date. Future applications of thermionic converters are projected, and, in turn, the report refers to the current need of continued applied research efforts aimed at advancing the state of the art from the presently available thermal conversion efficiency of about 10 percent up to the theoretically feasible level of approximately 30 percent. (Author)

THE COMMON COLLECTOR-COMMON EMITTER PAIR, by M. S. Ghausi and D. O. Pederson. Rept. on Contract N7onr-29529. 11 May 59, 18p. 8 refs. Rept. no. 87; IER Series no. 60, issue no. 236; AD-220702.
Order from LC mi$2.40, ph$3.30 PB 146 093

The analysis and design are presented of a CC-CE pair selected from a cascade of identical pairs. The primary interest is in low pass broadband amplifiers. Simple equivalent circuits for the pair are developed and a design procedure is given to achieve a flat-type magnitude transmission characteristic in the pass band. The gain bandwidth factor of a CC-CE pair is compared with the other broadband low pass amplifiers using the common emitter configuration with various broadbanding techniques. These other broadbanding techniques include: resistive broadbanding, series-peaking, local series feedback of a parallel RC network in the emitter lead and shunt-peaking. It is shown that for large bandwidths the combinational pair of CC-CE is superior in gain-bandwidth factor except for the shunt-peaked amplifier. (Author)

General Electric Co., Schenectady, N. Y.
INVESTIGATION OF UNIMODE ANODE TECHNIQUE. Final engineering rept. for 10 July-27 Sep 57 and 20 Jan-20 May 58 on Contract AF 30(602)1768. 12 Aug 58, 84p. 3 refs. RADC-TR-58-150; AD-205 916.
Order from LC mi$4.80, ph$13.80 PB 146 510

An analysis of the unimode problem, combining equivalent circuits and field theory analysis, was made. Several methods of unimoding were investigated, followed by the actual design of anodes using these methods. The unimode approach was then applied to new devices and experimental results obtained. (Author)

ENGINEERING TEST MODEL, ANTENNA AS-1019(XE-1)/TRD. DESIGN AND FABRICATE 50-320 MC DF ANTENNA, by R. E. Hunter. Quarterly progress rept. no. 2, 1 Nov 59-1 Feb 60, on Contract DA 36-039-sc-84533. [1960] 10p.
Order from LC mi$1.80, ph$1.80 PB 147 424

The majority of effort during this period was expended finalizing the design of the D/F atenna array with its supporting structure and preparing engineering drawings for these items for release to the manufacturing departments. The stress analysis was based upon wind loadings of 25 pounds per square foot (100 mph winds) from a direction relative to the antenna found to provide the maximum loads. Besides contractual environmental requirements, the D/F antenna array was designed to withstand handling and mis-handling of components and assemblies during field installation. These conditions were considered in conjunction with the weight limit established by the contractual specifications. The engineering drawings were prepared to meet military specifications as much as possible and specify all military specifications pertaining to the production of the parts. Fabrication was started on the first unit and associated tooling. Any items requiring long procurement time were ordered for both units. (Author) (See also PB 147 423)

Granger Associates, Palo Alto, Calif.
ENGINEERING TEST MODEL, ANTENNA AS-1019(XE-1)/TRD: A LOW FREQUENCY EXTENSION OF MODIFICATION KIT ELECTRONIC EQUIPMENT MK-383/TRD. DESIGN AND FABRICATE 50-320 MC DF ANTENNA, by R. E. Hunter and R. B. Kolbly. Quarterly progress rept. no. 1, 1 Aug-1 Nov 59, on Contract DA 36-039-sc-84533. 2 Jan 60, 31p. 1 ref.
Order from LC mi$3.00, ph$6.30 PB 147 423

The electrical design has been finalized using a log-periodic transposed-dipole array as the basic element. The log-periodic antenna has the characteristic that its radiation and impedance characteristics repeat as the frequency is changed by a factor, hence very large bandwidths with essentially constant radiation and impedance characteristics are obtainable. Two of these elements are mounted on the same axis to give both horizontal and vertical polarization; and three of these structures, consisting of two elements each, are arrayed forming the complete antenna. The antenna parameters have been optimized and are given in this report. Patterns for all modes of operation, as well as illustrative developmental patterns, are given. Impedance data for the element is also given. The VSWR of one antenna, relative to 75 ohms, is 1.3:1. For lobe-switched operation the half-power beamwidths are 42 degrees and 45 degrees for horizontal and vertical polarization, respectively. The equal-amplitude points are between 3 and 4 db for vertical polarization and from 2.8 to 3.6 db for horizontal polarization. In single-lobe operation the half power beamwidth is 65 degrees for horizontal polarization and 95 degrees for vertical polarization. (Author)

STUDY OF ATOMIC AND MOLECULAR RESONANCES FOR MICROWAVE GENERATION AND AMPLIFICATION, by T. Maiman, R. Hoskins, and D. Devor. Quarterly progress rept. no. 6, 15 Mar-15 June 59, on Contract DA 36-039-sc-74967. [1959] 17p. 12 refs. AD-228 178.
Order from LC mi$2.40, ph$3.30 PB 147 425

X-band ruby maser operation was observed up to a temperature of 195°K with dry ice used as a coolant. It was found that ruby crystals with high chromium content functioned poorly (low gain-bandwidth product) at 4.2°K but behaved normally at higher temperatures. An explanation based on cross relaxation is presented. A noise temperature of 100°K and a gain-bandwidth product of 14 Mc were measured for a maser operating at 77.4°K (temperature of liquid nitrogen). Preliminary results on calculations of the fine structure levels of Cr^{+3} in TiO_2 (rutile) are reported. Pulsed magnetic field experiments were conducted with ruby as the paramagnetic material. Inversion of successive spin levels by adiabatic fast passage at X-band followed by the application of a pulsed magnetic field resulted in pulsed amplification and oscillation at several frequencies from 14 kmc to 28 kmc. The rapid attainment of a Boltzmann distribution of spin populations when the energy levels become equidistant in a multilevel spin system was demonstrated directly. (Author)

Integrated Range Mission, White Sands [Missile Range] N. Mex.
A MICROWAVE TELEMETRY RELAY, by Leonard S. Taylor. 15 Apr 58, 88p. AD-216 078L.
Order from LC mi$4.80, ph$13.80 PB 147 367

A 2200 Mcps multichannel telemetry relay system has been developed. This equipment has been designed to provide a high capacity net interlinking all data recording sites and the fixed and mobile receiving stations on the proving ground. In addition, simultaneous calibration of all stations has been made possible. The relay employs the superheterodyne principle to translate all the VHF telemetry signals as a unit to the microwave region for transmission to the recording stations. The system features a large dynamic range. Close channel spacing is utilized for efficient use of bandwidth. Unattended operation of the equipment is possible. (Author)

Ionosphere Research Lab., Pennsylvania State U., University Park.
INSTRUMENTATION FOR THE DETERMINATION OF IONOSPHERIC POLARIZATION BETWEEN 100 AND 1,000 KC/S AND PRELIMINARY DATA, by H. N. Carlson. Scientific rept. no. 129 on Ionospheric Research, Contract AF 19(604)3875. 1 Feb 60, 41p. 10 refs. AFCRC-TN-60-406.
Order from LC mi$3.30, ph$7.80 PB 146 897

Equipment is described that receives ionospheric echoes over the swept range of radio frequencies 50-1000 kc/s and resolves them into their two circular components. This is accomplished by phase shifting and adding at a constant intermediate frequency. Circuits are designed for fast recovery since operation near the transmitter is necessary for RF tracking. Preliminary results are presented. (Author)

Keystone Electronics Co., Philadelphia, Pa.
INDUSTRIAL PREPAREDNESS STUDY ON MINIATURE SIZE QUARTZ CRYSTALS. COMPLETION REPORT FOR STEP I: INDUSTRIAL PREPAREDNESS STUDY ON CR-55/U CRYSTAL UNITS, by James M. Ronan. Rept. on Contract DA 36-039-sc-54696. 15 Jan 58, 33p.
Order from LC mi$3.00, ph$6.30 PB 137 445

Manufacture of CR-55/U quartz crystal units in the frequency range of 17.0 MC to 60.750 MC has not proven to be too difficult. Standard equipment was used for fabrication.

Land-Air, Inc., Hollorman, N. Mex.
DEVELOPMENT OF MIRAN REMOTE OPERATION. Final rept. on Contracts DA 29-040-ORD-1010 and DA 29-040-ORD-1302. Dec 58, 83p. 5 refs. LA-58-13; AD-214 433.
Order from LC mi$4.80, ph$13.80 PB 146 980

Automation of the Miran Relay Stations has been accomplished with the development of remote-control equipment. By means of a modulated RF signal, an operator at the Master Station is able to activate Miran equipment at distant Relay Stations, and to de-activate the equipment on completion of a mission. Considerable savings in manpower, travel time, and vehicles are effected. This report incorporates a description of the equipment and instructions for installation and operation. (Author)

A FIXED-CAP UHG TR TUBE, by C. W. Jones, C. E. Muehe, and S. J. Miller. Rept. on Contract AF 19(122)458. 29 Mar 57, 23p. 7 refs. Technical rept. no. 155; AD-147 407.
Order from LC mi$2.70, ph$4.80 PB 146 979

The existing TR tubes used in the region of the frequency spectrum between 1200 and 3000 Mcps are not satisfactory for use in UHF applications. This report describes a fixed-gap TR tube and its accompanying circuits that have been used successfully in UHF radar applications.

Material Lab., New York Naval Shipyard, Brooklyn.
EVALUATION OF BRAID COATINGS FOR CABLE CONDUCTORS WITH CLASS E INSULATION, by Samuel H. Behr and Edward J. Hoerauf. Final rept. 27 May 58, 9p. Lab. project 5248-111; AD-206 089.
Order from LC mi$1.80, ph$1.80 PB 147 368

Nylon lacquers with a four mil wall thickness will give substantial abrasion resistance providing they are applied in several thin coats with adequate heat drying between coats or after coating. Thinner walls of extruded nylon will give equal abrasion resistance. However, a braid saturant is necessary under the extruded nylon to lay down the glass fibers before tubing and also retard the flow of water through the glass braid. The improved abrasion apparatus described in this report will compare the abrasion resistance of braid coating materials with reasonable accuracy and is recommended for inclusion in the forthcoming amendment to specification MIL-C-2194B. SERIES-PARALLEL GRAPHS AND LATTICES, by Calvin C. Elgot and Jesse B. Wright. Rept. on Project Michigan, Contract Nonr-1224(21). 25 Feb 58, 26p. 2144-1120-M; AD-204 494.
Order from LC mi$2.70, ph$4.80 PB 138 247

A path in a doubly rooted graph $G=(N, E, R, p_0, p_1)$ is a sequence of distinct points in G, initiating with p_1 and terminating with p_2. The link relation of $G=(N, E, R, p_0, p_1)$ is the set of ordered pairs of points which are consecutive in some path. A graph is admissible if each of its points is in some path and for each edge of the graph with end points a, b, either (a, b) or (b, a) is an element of its link relation. Theorem: If $G=(N, E, R, p_0, p_1)$ is admissible, then it is series-parallel if and only if its link relation is asymmetric. This theorem is proved by obtaining intermediate results which characterize the transitive closure of the link-relations of series-parallel graphs (as series-parallel lattices). (Author)

HIGH REPETITION RATE BROADBAND DUPLEXER, by Emanuel L. Horn. Quarterly progress rept. no. 5, 15 Aug-15 Nov 59, on Contract DA 36-039-sc-78165. [1959] 14p. AD-232 341.
Order from LC mi$2.40, ph$3.30 PB 147 428

Measurements of arc loss and recovery time have been continued at low repetition rates. The data show that although the dumbell type iris structure yields lower values of arc loss it also yields larger values of recovery time than the encapsulated window. A design investigation has been initiated to fabricate tubes with all elements encapsulated in order to eliminate the difficulties normally encountered in fabricating dual S band TR tubes. (Author) (See also PB 146 494)

Microwave Associates, Inc., Burlington, Mass.
INVESTIGATION OF DUPLEXING TECHNIQUES AT HIGH DUTY CYCLE CONDITIONS, by Lawrence Gould. Quarterly progress rept. no. 4, 1 July-30 Sep 59, on Contract DA 36-039-sc-78233. 29p. AD-231 514.
Order from LC mi$2.70, ph$4.80 PB 146 795

The study of Tee circulators as an element in a high duty cycle duplexer has been continued. Operation at 180 watts average power in X band has been achieved. The characteristics of leakage power and recovery time for crystal protector TR tubes have been measured for various mixtures of argon, water, and ammonia. The most promising gas fill is a mixture of water and ammonia which yields a recovery time independent of temperature from -55°C to 85°C with a recovery time value of the order of 0.2 μs. The analysis of the silicon diffuse junction diode in a microwave circuit is considered as a possible element in a high duty cycle duplexer. (Author) (See also PB 146 495)

Microwave Associates, Inc., Burlington, Mass.
INVESTIGATION OF DUPLEXING TECHNIQUES AT HIGH DUTY CYCLE CONDITIONS, by Lawrence Gould. Quarterly progress rept. no. 5, 1 Oct-31 Dec 59, on Contract DA 36-039-sc-78233. [1960] 16p.
Order from LC mi$2.40, ph$3.30 PB 146 796

A circulator can be designed having a 10% bandwidth. The recovery time characteristics of a crystal protector TR tube have been investigated at low values of peak power. The results indicate that excessively large values of recovery time can be achieved during the ranges of incident power in which the input gap and window fire. The analysis of the silicon diffused junction diode as an element in a high duty cycle duplexer has demonstrated inferior performance at X band because of the series inductance associated with the diode package. (Author) (See also PB 146 795)

Microwave Engineering Labs., Inc., Palo Alto, Calif.
INVESTIGATION OF MICROWAVE NON-LINEAR EFFECTS UTILIZING FERROMAGNETIC MATERIALS, by Roy W. Roberts. Quarterly progress rept. no. 10, 1 Aug-31 Oct 59, on Contract DA 36-039-sc-73278. [1959] 24p. 3 refs. AD-231 484.
Order from LC mi$2.70, ph$4.80 PB 146 941

A high moment nickel-zinc ferrite was made in the laboratory for use in harmonic generation. Measured linewidths were approximately 45-60 oer. This material had a high efficiency in 2 mm generation, giving approximately 10-20 peak output. Further experiments were run on the ferrite parametric amplifier and magnetic Q, gain, and noise power were measured. Three additional batches of single crystal garnets were grown with better temperature control and mechanical stability. One batch was grown with a modified flux of PbO and PbF_2 and using a technique of recharging the crucible so that total reactant mass was increased 3-fold over previous runs. This batch gave many large crystals with linewidths as narrow as 2.5 oer. (Author)

ELECTRONICALLY-TUNABLE MICROWAVE OSCILLATIONS AND DETECTION AND MIXING PROPERTIES OF A COAXIAL MAGNETRON, by R. M. Hill and F. A. Olson. Rept. on Contract DA 36-039-sc-73188, Continuation of Contract DA-36-039-sc-71053. 30 June 57, 30p. 16 refs. Technical rept. no. MPL-7.
Order from LC mi$2.70, ph$4.80 PB 146 789

Results are given of preliminary investigations of the behavior of self-excited electron oscillations originating in the space charge region between a hot wire filament and a cylindrical anode in the presence of a magnetic field. This coaxial magnetron is observed to oscillate and emit radiation at a frequency nearly equal to the electron cyclotron frequency divided by the $\sqrt{2}$. Although this phenomenon has been mentioned in the early magnetron literature, it has received little attention from a practical standpoint. By varying the magnetic field and programming the anode voltage, it is possible to tune the frequency of this tube and the possibility of rugged construction, it appears promising as a useful local oscillator tube that could be designed to cover at least octave bandwidths throughout the frequency range from about 300 megacycles to 12 kilomegacycles.

Microwave Research Inst., Polytechnic Inst. of Brooklyn, N. Y.
ELECTROMECHANICAL PULSE GENERATORS, by Enrico Levi. Rept. on Contract Nonr-839(05). 6 July 59, 36p. Research rept. R-751-59; PIB-679; AD-220 852.
Order from LC mi$3.00, ph$6.30 PB 147 084

Generation of electrical pulses directly at the electromechanical energy conversion stage may prove to be most economical for radar and fusion research applications, in view of the ever increasing power levels required. Conventional types as well as the induction pulser, considered as a model for future thermonuclear generators, are described in terms of a fundamental set of equations of which the solution is presented for limiting cases. On this basis it is possible to evaluate the relative merits of each type, to deduce design principles and derive efficiency expectancies and ultimate power capabilities. (Author)

Microwave Research Inst., Polytechnic Inst., of Brooklyn, N. Y.
STUDY OF MICROWAVE FERRITE DUPLEXERS, by Lawrence Levey and Leo M. Silber. Final rept. for 1 Apr 58-30 Sep 59 on Contract DA 36-039-sc-78000. 15 Jan 60, 44p. 5 refs. Rept. no. R-795-59; PIB-723.
Order from LC mi$3.30, ph$7.80 PB 146 792

The development is summarized of a microwave circulator in which the ferrite element is in the form of a hollow tube of rectangular cross-section. This ferrite geometry lends itself to fast switching applications. A discussion is included of the requisite properties of ferrite materials for optimum operation of a switching circulator and describes the development of suitable materials and the means by which they were fabricated into the necessary shapes. The switching performance of a prototype circulator is described. (Author)

Midland Mfg. Co., Inc., Kansas City, Kan.
INDUSTRIAL PREPAREDNESS STUDY ON TIGHTENED TOLERANCE CR-54/U CRYSTAL UNITS CR-(XM-9)/U. Final rept. for 31 Dec 57-7 Apr 58 on Contract DA 36-039-sc-75936. 23 May 58, 47p.
Order from LC mi$3.30, ph$7.80 PB 137 440

An outline for the process specification for tightened tolerance CR-54/U quartz crystal units is presented. (See also PB 137 441)

Midland Mfg. Co., Inc., Kansas City, Kan.
INDUSTRIAL PREPAREDNESS STUDY ON TIGHTENED TOLERANCE CR-54/U CRYSTAL UNITS CR-(XM-9)/U. Quarterly progress rept. nos. 1 and 2 for period through 31 Dec 57 on Contract DA 36-039-sc-75936. 14 Mar 58, 22p.
Order from LC mi$2.70, ph$4.80 PB 137 441

Techniques involved in changing the production process to producing an acceptable yield under the tightened tolerance condition were developed and tested in an effort to determine their suitability.

Motorola, Inc., Chicago, Ill.
INVESTIGATION OF METHODS AND TECHNIQUES FOR DETECTING UNWANTED CRYSTAL MODES, by B. Niederman and J. Loos. Annual rept. no. 1 (4th quarter) 1 Mar-1 June 57, on Contract DA 36-039-sc-72378. [1957] 32p. 2 refs. AD-138 882.
Order from LC mi$3.00, ph$6.30 PB 147 415

A number of crystal oscillators presently used in commercial equipment have been analyzed to determine the maximum value of series R capable of sustaining oscillations. The three oscillators to be used in the final instrument are individually described. Data obtained with experimental models and available crystals are given for the high and low bands. The composite test set is described both functionally and physically. (Author) (See also PB 147 418)

Motorola, Inc., Chicago, Ill.
INVESTIGATION OF METHODS AND TECHNIQUES FOR DETECTING UNWANTED CRYSTAL MODES, by B. Niederman and J. Loos. Final rept. for 13 Feb 56-30 Nov 58 on Contract DA 36-039-sc-72378. [1958] 97p.
Order from LC mi$5.40, ph$15.30 PB 147 422

The present status of the "Unwanted Crystal Mode Detector" is discussed. A complete schematic for each of the two units comprising the complete detector test set is illustrated and described. Circuitry for the low, mid and high band detectors is covered extensively as are the special voltage metering circuits. The panel layout of each unit is illustrated. The functions of all variable controls are discussed. The operating procedure for testing a crystal for harmful spurious modes is covered in detail. A series of reference oscillators chosen from ARF designs are described and their use in determining which spurious responses are harmful is discussed. Spurious data obtained from the entire quantity of two hundred crystals furnished by the Signal Corps is presented in tabular form. The results are analyzed from the standpoint of the Detectors ability to detect all crystal modes considered harmful. The gain calibration curves for the two prototype units are illustrated. The twenty-seven crystals previously tested at the Signal Corps, have been tested at their maximum allowable drive level whenever possible. This data is presented in tabular form. (Author) (See also PB 147 421)

Motorola, Inc., Chicago, Ill.
INVESTIGATION OF METHODS AND TECHNIQUES FOR DETECTING UNWANTED CRYSTAL MODES, by B. Niederman and J. Loos. Quarterly rept. no. 1, 1 June-1 Sep 56, on Contract DA 36-039-sc-72378. [1956] 34p. 1 ref.
Order from LC mi$3.00, ph$6.30 PB 147 416

The required instrument is divided into the following three parts - R. F. oscillator-selective network - metering. Complete functional details are given for each of these proposed parts. The R. F. oscillator has been built and the circuit is given. Work has begun on an R. F. detector, having good response characteristics between the frequency limits of 1 to 110 megacycles, which is to be used in conjunction with the metering circuits. The crystal oscillators to be used in determining the spurious specifications are described. The two oscillators most likely to prove unstable, the Colpitts and the Butler, are now being constructed. (Author)

Motorola, Inc., Chicago, Ill.
INVESTIGATION OF METHODS AND TECHNIQUES FOR DETECTING UNWANTED CRYSTAL MODES, by B. Niederman and J. Loos. Quarterly rept. no. 2, 1 Sep-1 Dec 56, on Contract DA 36-039-sc-72378. [1956] 23p. 1 ref.
Order from LC mi$2.70, ph$4.80 PB 147 417

The crystal oscillators to be used in determining the spurious specification are described. Circuits of these oscillators at three test frequencies are given. Two methods which will be used at the lowest test frequency to experimentally determine the susceptibility of an oscillator to operate on a spurious response are explained. The results of the crystal procurement program to date are given. (Author) (See also PB 147 416)

Motorola, Inc., Chicago, Ill.
INVESTIGATION OF METHODS AND TECHNIQUES FOR DETECTING UNWANTED CRYSTAL MODES, by B. Niederman and J. Loos. Quarterly rept. no. 3, 1 Dec 56-1 Mar 57, on Contract DA 36-039-sc-72378. [1957] 57p. AD-133 350.
Order from LC mi$3.60, ph$9.30 PB 147 418

The Butler and Hartley oscillator circuits were analyzed to determine the highest values of crystal spurious resistances capable of sustaining oscillations. Schematic diagrams are given of the 6- to 7-mc Butler and Hartley oscillator circuits. By utilizing the equations derived, the highest values of spurious resistances capable of controlling oscillations in these 2 circuits were computed. The main and spurious mode resistances and frequencies of the crystals used to test the oscillators are tabulated, and the spurious responses detected by the test oscillators are indicated. The over-all ability of the Hartley oscillator to detect spurious responses is given by a curve of highest spurious resistances detected vs the percentage of the frequency difference from the main response. A similar curve which is expanded to include only those responses within 1% of the main response frequency is also obtained by the use of the similated spurious technique. (See also PB 147 417)

Motorola, Inc., Chicago, Ill.
INVESTIGATION OF METHODS AND TECHNIQUES FOR DETECTING UNWANTED CRYSTAL MODES, by B. Niederman and J. Loos. Quarterly rept. no. 5, 1 June-1 Sep 57, on Contract DA 36-039-72378. [1957] 31p. AD-149 751.
Order from LC mi$3.00, ph$6.30 PB 147 419

The completed laboratory experimental model of the Crystal Spurious Mode Detector is described. Experimental high band oscillators using an "Inductuner" to cover the entire band are described. One oscillator is a standard Butler and the other a grounded-grid circuit with the feedback taken from a capacitor tap. Three standard grounded-grid oscillators specifically constructed for high frequency operation and designed to cover the high band are described. The results obtained by testing available crystals are given. Two oscillators, constructed for the purpose of defining an "unwanted crystal mode", are described and results given. (Author) (See also PB 147 415)

Motorola, Inc., Chicago, Ill.
INVESTIGATION OF METHODS AND TECHNIQUES FOR DETECTING UNWANTED CRYSTAL MODES, by B. Niederman and J. Loos. Quarterly rept. no. 6, 1 Sep 57-1 Feb 58 on Contract DA 36-039-sc-72378. [1959] 44p.
Order from LC mi$3.30, ph$7.80 PB 147 420

A summary is given covering the low, mid and high-band detectors. Included are the major electrical and mechanical changes for the mid-band detector. Development information covering all three bands is presented. The inductuner oscillator is compared with the three separate oscillator method of covering the high-band. Tuning requirements and the present status of the low-band oscillator are given. Spurious detection data covering the mid-band (6-40 Mc) and the high-band (40-125 Mc) ranges are presented and analyzed. (Author) (See also PB 147 419)

Motorola, Inc., Chicago, Ill.
INVESTIGATION OF METHODS AND TECHNIQUES FOR DETECTING UNWANTED CRYSTAL MODES, by B. Niederman and J. Loos. Quarterly rept. no. 7, 1 Feb-1 May 58, on Contract DA 36-039-sc-72378. [1958] 51p.
Order from LC mi$3.60, ph$9.30 PB 147 421

The status of the two prototype Unwanted Crystal Mode Detector units is discussed. A complete circuit diagram of each detector unit is illustrated and described. Functions of all variable controls are discussed. Metering circuits are also explained. The panel layout of both units is illustrated. The controls are described in detail. The operating procedure of testing a crystal for unwanted spurious modes is outlined. Spurious data obtained with the low frequency detector (1-40 Mc) using government supplied crystals are given. Data at 10 Mc, 30 Mc, 50 Mc, 75 Mc and 100 Mc using both prototype detector units and A.R.F. "reference" oscillators are presented. The results are analyzed from the standpoint of the Detectors ability to detect all crystal modes considered harmful. (Author) (See also PB 147 420)

National Union [Electric] Corp., Orange, N. J.
MINIATURE CATHODE RAY TUBE, R-2163, by F. Holborn and C. Bartholomew. Final engineering rept. on Contract AF 33(038)17345. [1953] 43p. AD-14 027.
Order from LC mi$3.30, ph$7.80 PB 146 916

Two versions of the tube were developed. The first uses a Willemite screen (P-1) which gives a green trace and has medium persistence. The second uses a long-persistence cascade phosphor (P-7). The tube envelope consists of lead glass (Corning 0120) except for the face plate, which is made of Fourco glass. A modified small-button 9-pin stem is used. Electrostatic focus and deflection are utilized in the electron gun which is supported in the envelope by 4 support springs. The springs also serve to absorb shock and vibration. About 10% of the cathode current reaches the screen, and the rest is absorbed by the limiting apertures. The tube passed the vibration test and a 500-g shock test. Both versions of the tube suffered

a burning of the phosphor screen during life tests. A life test period of 500 hr or less was considered to be more realistic than the 1000-hr test. The method of producing the tube is described. The tubes operated at LV, had good light output, and did not have an exposed exhaust tip.

Mound Lab., Miamisburg, Ohio.
NUCLEAR BATTERY, THERMOCOUPLE TYPE, by B. C. Blanke. Quarterly rept. no. 1, 1 Jan-31 Mar 57, on Contract R-50-799965-sc-01-91. 26 Apr 57, 18p. 6 refs. MLM-CF-57-4-34; AD 146 708.
Order from LC mi$2.40, ph$3.30 PB 147 127

The potential usefulness as a heat source for the thermal battery of 1300 radioactive isotopes was investigated. All but thirty-two have been eliminated because of too long or too short a half-life and/or excessive gamma radiation of the isotope or element. Further eliminations are being made on the basis of relative availability and costs. (Author)

National Bureau of Standards, Washington, D. C.
AN IMPROVED HYDROGEN ATOM BEAM FURNACE, by Ralph Klein and John Pararas. May 60, 9p. 2 refs. Technical note 47.
Order from OTS $0.50 PB 151 406

An improvement in the construction of the tungsten furnace for use in a hydrogen atom-beam apparatus has been effected by fabricating the furnace from a tungsten rod. This avoids the possibility of leakage of molecular hydrogen which may occur when the tungsten tube is made from rolled tungsten sheet, the technique used heretofore. The fabrication of the seamless furnace and the method of mounting are described. (Author)

National Union [Electric] Corp., Orange, N. J.
MINIATURE TWIN INDICATOR TUBE R-2164, by H. J. Koch. Final engineering rept. on Contract AF 33(038)17345. [1952] 51p. AD-13 884.
Order from LC mi$3.60, ph$9.30 PB 146 917

A twin indicator miniature equivalent of the 6AF6G was developed. The solder glass, poli-optic sealing, and fused glass techniques were employed in an effort to seal the tube in a vacuum after processing. It was concluded that it was impractical to seal a tube together in the bell jar under vacuum with a glass-to-glass seal. Another method was tried which consisted of sealing the bulb and stem in the usual manner and exhausting through a tubulation in the stem. To eliminate the projecting tip-off, the glass had to be mashed down while still soft. The first tubes made in this fashion developed stem cracks. Test diodes were made using Pb glass bulbs. Prior to tipping-off, the getters were flashed lightly to absorb gas liberated from the glass during the annealing period; however PB was reduced out of the glass. Life tests indicated that tubes having soft glass (lime) envelopes can be made to operate at bulb temperatures up to 400°C.

Naval Civil Engineering Lab., Port Hueneme, Calif.
CONTIGUOUS WRAPPING OF TRANSMISSION LINE CONDUCTORS WITH HIGH-MU TAPE FOR LARGE RADIO-INTERFERENCE ATTENUATION, by Don B. Clark and Robert D. Hitchcock. Interim rept. 7 Mar 60, 47p. 10 refs. Technical rept. 062.
Order from LC mi$3.30, ph$7.80 PB 147 115

Wrapping high-permeability SiFeMg tape around transmission line lowers radio frequency energy in normal interference frequency ranges. In theory, a long conductor coated with high-permeability material has high skin effect losses at frequencies above those of power transmission. Three long conductors were wrapped with thin, high-permeability tape; two conductors had small helical air-gaps between wrappings to reduce saturation effects. These two had about half the attenuation of the fully wrapped line, lower standing wave ratios and lower characteristic impedance phase shift. (Author)

Naval Ordnance Lab., Corona, Calif.
TEST SET, ELECTRICAL OUTPUT, FUZE, MK 378 MOD O: DESCRIPTION AND OPERATION. 7 Apr 60, 66p. NAVWEPS rept. 5988; NOLC rept. 494; Includes NAVORD OS-(10325-10326).
Order from LC mi$3.90, ph$10.80 PB 147 285

This report presents a description and instructions for operation of the Test Set, Electrical Output, Fuze, Mk 378 Mod O, which was developed at the Naval Ordnance Laboratory Corona for use in factory acceptance testing of the Switch, Firing, Electronic, Mk 73 Mod O, and the Triggering Device, Fuze, Mk 3 Mod O. The set is constructed in two sections, so that it may be used either for combined tests of the triggering device and firing switch or for separate testing of either component. Appendixes A and B present the original Ordnance Specifications (NAVORD OS 10326 and NAVORD OS 10325) for the two components to be tested. (Author)

MAGNETIC PULSE MODULATORS, by Walter Raskin. 25 Aug 58, 21p. 9 refs. NAVORD rept. 6190; AD-206 318.
Order from LC mi$2.70, ph$4.80 PB 147 389

The magnetic pulse modulator of the Melville type is analyzed, the present state of the art is summarized, and engineering limitations imposed by components are discussed. A bibliography of literature in this field is included. (Author)

Navy Underwater Sound Lab., Fort Trumbull, New London, Conn.
A SMALL-TANK CALIBRATION SYSTEM, by Gerald F. Ginty. 31 Aug 55, 13p. USL Research and Development rept. no. 292.
Order from LC mi$2.40, ph$3.30 PB 147 602

The small-tank calibration system measures hydrophone sensitivity and directivity pattern in the frequency range from 5 to 150 kc by means of AC tonal pulses. A pulse of the desired frequency is gated into a transmitting power amplifier and projector and is received by the hydrophone under test. The received

pulse is then logarithmically amplified; any desired part of the pulse is selected by a receiver gate, and the gated portion is peak detected and stored as a direct voltage. The direct voltage is fed to a sine-cosine potentiometer, the output of which drives a cathode-ray tube in order to provide a PPI display of received decibel level as a function of hydrophone bearing. In addition, the direct voltage is chopped and used to drive conventional polar ink recorders. The transmitted and received pulses are controllable in duration and repetition rate and may be set in accordance with considerations of tank dimensions and transducer-response time. The repetition rate of transmitted and received pulses may be varied from 15 to 60 pulses per second. The duration of the transmitted pulse may be varied from 100 microseconds to 100 milliseconds, and the duration of the receiver gate may be varied from 50 microseconds to 10 milliseconds. Time delay between the transmitter and receiver gates is variable between 100 microseconds and 100 milliseconds. (Author)

New York U. Coll. of Engineering, N. Y.
THE EFFECTS OF DISTORTION ON VIDEO CORRELATION, by M. Frankfort, B. Harris and others. Technical note on Contract AF 30(602)1655. 15 Oct 58, 69p. 16 refs. RADC-TN-58-360; AD-206 042.
Order from LC mi$3.90, ph$10.80 PB 146 173

An analysis is made of a video correlator which has distortion present in its input channels. In particular power law distortions, ideal limiting, and partial limiting, are considered. Assuming a sampling correlator and use of sufficient number of samples to make the central limit theorem applicable, the effect of power law distortion is found to be a few decibels drop in the output signal-to-noise ratio of the correlator. An exact analysis carried out for some limiting cases shows that even this small reduction may be due only to the approximations made in the general analysis. These results are obtained for distortion in one or both of the correlator input channels. It is felt therefore, that in many cases it may be possible to make considerable savings in equipment at only a small cost in performance by relaxing fidelity requirements on signal transmission to the correlator.

Office of Scientific Research and Development. Div. 13.
DIRECTION FINDER AND ANTENNA RESEARCH. Summary technical rept. vol 1, Contract OEMsr-1131. 1946, declassified 23 Apr 58, 299p. 123 refs.
Order from LC mi$11.10, ph$45.60 PB 139 790

Contents:

INTRINSIC-BARRIER TRANSISTOR TECHNIQUES (SILICON), by J. L. Buie. Quarterly rept. no. 8, 15 Apr-15 July 59, on Contract DA 36-039-sc-74887. [1959] 19p. PSI rept. no. 3000:15-23-Q; AD-229 488.
Order from LC mi$2.40, ph$3.30 PB 146 791

A sequence of design, fabrication, and characterization techniques was developed for very-high-frequency silicon transistors. In the course of evaluating these techniques, it was shown that a wide range of useful transistors could be constructed. These transistors demonstrated power outputs of 100 mw at 200 mc, 1 watt at 70 mc, 3/4 watt at 108 mc, and 5 watts at 10 mc. In addition, techniques-evaluation samples were delivered which exceeded these specific requirements, showing power output approaching 5 watts at 70 mc, and exceeding 3 watts at 100 mc, and 2 watts at 150 mc. An even wider range of frequency and power is known to be within the capability of the techniques developed. (Author) (See also 142 768)

Pan-Electronics Corp., Griffin, Ga.
INDUSTRIAL PREPAREDNESS STUDY: QUARTZ CRYSTAL UNITS CR-56/U; COMPLETION REPORT ON STEP I. Rept. on Contract DA 36-039-sc-72680. [1958] 28p.
Order from LC mi$2.70, ph$4.80 PB 137 414

A process is described for the fabrication of CR-56/U Quartz Crystal Units in the range of 50 to 100 Megacycles. No drastic changes in normal production techniques were required although many refinements in existing procedures were found necessary to get acceptable yields.

Philco Corp., Philadelphia, Pa.
RESEARCH AND EXPERIMENTAL WORK ON MICROWAVE TRANSISTORS, by W. C. Follmer, M. M. Fortini and others. Quarterly progress rept. no. 6, 15 Apr-15 July 59, on Contract DA 36-039-sc-74988. [1959] 19p. 4 refs. Philco H-2153-6; AD-228 330.
Order from LC mi$2.40, ph$3.30 PB 146 489

Studies have been made of the frequency and power-handling capabilities of silicon NPN transistors operating as negative-resistance oscillators. The highest output power was 0.42 mw with a DC input of 205 mw. Investigation of the Esaki tunnel diode is being carried out. A microwave Hall oscillator was designed and built. See also PB 143 877.

Polytechnic Inst. of Brooklyn, N. Y.
RESEARCH ON AND DEVELOPMENT OF ION-SELECTIVE AND ION-SPECIFIC MEMBRANES FOR USE IN THE LARGE-SCALE, LOW-COST DEMINERALIZATION OF SALINE WATER BY SELECTIVE ELECTRODIALYSIS. Rept. on Contract no. 14-01-001-62. May 60, 77p. 42 refs. Office of Saline Water Research and Development Progress rept. no. 37.
Order from OTS $2.00 PB 161 694

The purpose of this investigation was to investigate known membrane systems which might be more permeable to ions with a double negative charge than to ions with a single negative charge, and to attempt the preparation of membranes of improved specificity. A membrane possessing this characteristic would be useful for removing sulfate from a solution of chloride and sulfate where the sulfate content is too high or to fractionate a mixture of the ions into two solutions, each one containing only one of the ions. Two commercial membranes, Nalfilm 2 and Nalfilm 4, were investigated. Four different heterogeneous membranes were prepared using anion exchange resins in a Dynel matrix. Tests were performed on the membranes to determine the amount of specificity. The various tests made on all the membranes indicate that other and more simple means may be found for determining the amount of ion-specificity in an ion-selective membrane than the relatively difficult procedure of measuring the transport numbers directly. It was demonstrated that the relative transport numbers for sulfate and chloride may vary from 0.75 to 1.12.

Radio Corp. of America, Harrison, N. J.
EVALUATION OF TWO TYPES OF S-BAND PULSED PENCIL-TUBE-AND-CAVITY TRANSMITTER UNITS. VOLUME 1: EVALUATION, by R. E. Brooks. Final rept. for 3 June 57-31 Jan 59 on Contract DA 36-039-sc-74845. [1959] 129p. AD-226 526.
Order from LC mi$6.30, ph$19.80 PB 145 963

This 3-volume report presents an evaluation of the performance of 2 types of S-band, pulsed, pencil-tube-and-cavity transmitter units. Vol. 1 presents the results, conclusions, recommendations, and proposed specifications of the RCA A-15095 plate-pulsed and A-15100 grid-pulsed developmental units. Vol. 2 contains the manufacturing specifications for the RCA developmental type A-15109 pencil tube used in both types of units, and manufacturing specifications for the two transmitter units. Vol. 3 contains the test data and X-ray pictures of each of the 200 units as well as drawings of the mismatch introducer developed for use in this contract. The major conclusion reached from this evaluation was that the greatest deterioration in power and frequency characteristics was obtained primarily under operating conditions that resulted in maximum peak current. A remarkable phenomenon observed was that operation of the units with reduced heater voltage increased life from about 150 hours to about 450 hours. The specified environmental conditions of shock, vibration, rotation, load mismatch, and increased pulse repetition rates were found to have little effect on the operation of these units. X-ray inspection techniques led to more realistic tolerances in the manufacturing specifications, and will serve as an important means of increasing yield during production. (Author)

Radio Corp. of America, Harrison, N. J.
EVALUATION OF TWO TYPES OF S-BAND PULSED PENCIL-TUBE-AND-CAVITY TRANSMITTER UNITS. VOLUME 2: MANUFACTURING SPECIFICATIONS, by R. E. Brooks. Final rept. for 3 June 57-31 Jan 59 on Contract DA 36-039-sc-74845. [1959] 153p. AD-226 527.

INDUSTRIAL PREPAREDNESS STUDY: LOW-NOISE TRAVELING-WAVE AMPLIFIER, by E. Goldman. Quarterly progress rept. no. 6, 1 Oct-31 Dec 57, on Contract DA 36-039-sc-72733. [1957] 15p.
Order from LC mi$2.40, ph$3.30 PB 137 798

The general purpose of the contract is to provide facilities for the production of a low-noise traveling-wave amplifier, type 6861; and to produce a sample run of 50 tubes. All equipment has been received, installed and is in operation. Type approval subject to satisfactory completion of life test has been granted. The pilot run tubes have been produced.

STUDY OF PLATINOTRON DEVICES. Quarterly rept. no. 3, 1 May-1 Aug 59, on QKS779/QR814, Contract DA 36-039-sc-78229. [1959] 57p. AD-229 004.
Order from LC mi$3.60, ph$9.30 PB 147 427

The QKS-779 identifies Task 3.1 which calls for a research program aimed at developing a microwave tube capable of producing a minimum of 100 watts CW power and operating in the vicinity of 35 kilomegacycles. The tube should have a minimum bandwidth of 10%. Task 3.6, identified as the QR-814, concerns itself with the investigation of the problem of matching external transmission lines to the platinotron network in an improved manner for better electrical characteristics and greater power handling capability. During this period both of these tasks received considerable attention. The development of the QKS-779 was advanced to the point where the first tube had been pumped and some information obtained. The work on the QR-814 consisted of investigating both a coaxial type of match and a match having more direct physical connection between the waveguide and the platinotron network. The latter arrangement would eliminate the disadvantages of the parallel wire transmission line in current use in the transition of the QK680. (Author)

MICRO-MODULE PRODUCTION PROGRAM, by Paul K. Taylor. Quarterly rept. no. 1, 1 Apr-30 June 58, on Contract DA 36-039-sc-75968. [1958] 149p. MM-206.
Order from LC mi$7.20, ph$22.80 PB 146 042

The Micro-Module Concept is a new approach to electronic equipment design. The object is to take advantage of the increased component density and improve the volumetric efficiency of the units in order that equipment can be built that will be more easily transportable and still maintain the same or a higher degree of reliability. A screening process using DuPont silver paste that is brushed on, has merit and appears to be quite satisfactory on bodies used thus far. Tantalum electrolytic capacitors have been made using .0015 inch thick foil. Resistors have been built using evaporated metal oxide on glass, quartz and ceramics. An investigation was conducted to examine properties of core material suitable for toroidal construction of tuned circuits. The processing technique, for "in-plastic" sealing of pretested electrically good, drift transistors, was used to fabricate experimental transistor units.

DEVELOPMENT AND EVALUATION OF NAVARHO LONG DISTANCE NAVIGATION SYSTEM, by Paul S. Wilson. Jan 60, 143p. 13 refs. RADC-TR-59-107.
Order from LC mi$7.20, ph$22.80 PB 146 842

The NAVARHO Program is the most recent Air Force effort directed toward the development and evaluation of a low frequency, long distance, ground based, radio navigation system. The purpose of the development was to evolve a navigation system combining the advantages of previous systems but eliminating, insofar as possible, the disadvantages. A rhotheta technique was chosen, largely because it was believed that such geometry would provide a circular service area with uniform accuracy in all directions from the ground facility. The program included the development of both airborne receiving equipment and a ground based transmitter facility. While the accuracies required by military specifications were not fully met, it is indicated that, with certain refinements, the system would be fully adequate for worldwide, peacetime applications. A SECURE NARROW BAND CLOSED CIRCUIT TELEVISION SYSTEM FOR MILITARY APPLICATIONS (TELEVISION COMMUNICATIONS SYSTEM AN/FXC-1), by Richard C. Benoit, Jr. and Frank Coughlin, Jr. Feb 60, 22p. 5 refs. RADC-TN-60-2; AD-232 767.
Order from LC mi$2.70, ph$4.80 PB 146 111

Television communication system AN/FXC-1 is a voice bandwidth monochrome television system capable of transmitting printed, scenic, graphic briefings and other visual data between two or more distant points. It provides full communications security when used with a standard code generator. Secure duplex audio facilities are also provided when the equipment is used with approved security devices. Transmission media are three standard toll quality voice circuits.

INSTRUCTION BOOK: REPORT ON ELECTRONIC RAY TRACER. Rept. on Contract Nonr-1819(00). Oct 57, 102p. Rept. no. 2264-8086-2
Order from LC mi$5.70, ph$16.80 PB 137 555

The Electronic Ray Tracer is a device to be used as an aid in the study of sonar wave propagation. It computes and plots a family of rays through a medium by solving an approximation of the basic differential equations which govern the propagation of waves through a medium where velocity is a function of depth only. This equipment is well adapted for rapid analysis of a transmission problem of radar and radio wave as demonstrated by the Air Force under a limited set of ambient conditions.

Stackpole Carbon Co., St. Marys, Pa.
IMPROVED CARBON BRUSHES FOR AIRCRAFT ELECTRICAL MACHINES, by Robert E. Nelson. Rept. for 1 Nov 55-1 Nov 58 on Evaluation of Carbon Brushes, Contract AF 33(600)31195. Jan 60, 102p. 4 refs. WADC Technical rept. 57-170.
Order from OTS $2.50 PB 161 760

The primary purpose of this contract was the evaluation of improved carbon brushes for use in aircraft rotating machines at 8,000 RPM from sea level to 80,000 ft. The evaluation was based on bell jar, slip ring, sea level and altitude chamber equipment test results. Specific performance checks were conducted in oil and oil vapor, in high ambient temperature, at very low and very high humidity levels, in dry nitrogen, in high vacuum, on rhodium plated, monel and copper slip rings, as well as on practical machines at sea level and in the Cornell and WADC altitude chambers. Electrical, chemical, physical, densitometer, x-ray fluoroscope, x-ray diffraction, metallograph and mass spectrometer checks were employed in material analyses.

Stanford Electronics Labs., Stanford U., Calif.
A THEORY FOR THE TRANSIENT ANALYSIS OF AVALANCHE TRANSISTOR PULSE CIRCUITS, by D. J. Hamilton. Rept. on Contract Nonr-225(24). 15 June 59, 68p. 17 refs. Technical rept. no. 1701-1; AD-218 575.
Order from LC mi$3.90, ph$10.80 PB 146 426

A simple physical theory is developed which describes the transient behavior of an avalanche transistor in terms of its physical parameters. The consideration of the minority carrier charge stored in the base during the transient process is an important factor in the development of the theory, and major emphasis is placed upon the use of charge variables in describing the model for the transistor. The theory is applied in the analysis of two classes of avalanche transistor pulse circuits: that in which the transistor is used with a capacitive load, and that in which the transistor is used with a resistive load.

Stanford Research Inst., Menlo Park, Calif.
APPLIED RESEARCH IN MICROMINIATURE FIELD EMISSION TUBES, by W. W. Hansen. Quarterly progress rept. no. 1, 1 July-1 Oct 59, on Contract DA 36-039-sc-84526. Oct 59, 26p. 2 refs. AD-231 935.
Order from LC mi$2.70, ph$4.80 PB 146 797

Research concerns a study of microminiature field emission devices which ultimately can be fabricated from thin films of refractory metals and insulators, using electron-activated machining techniques. These techniques involve the use of high resolution electron beams acting on the films in the presence of decomposable gases. Beam induced chemical reactions permit the etching or deposition of films in preselected patterns and may lead to the construction of large assemblies of interconnected electronic components of minute size. Apparatus is being designed for the study of simulated tubes containing field emission cathodes. Principal components are a demountable ultra-vacuum chamber and a micro-manipulator to produce small displacements of tube elements in three dimensions. Field plots were made with the use of an electrolytic tank, and electrode models were constructed, to estimate tube performance and to define optimum conditions of operation. Emitters, filaments, and phosphors were made and tests indicate that they are satisfactory. (Author)

Stanford Research Inst., Menlo Park, Calif.
INVESTIGATION OF HIGH-POWER FILTER TECHNIQUES, by E. M. T. Jones, S. B. Cohn, and E. D. Sharp. Annual rept. no. 1, 18 Feb 58-18 Feb 60, on Contract AF 30(602)1998. Mar 60, 56p. 27 refs. SRI Proj. 2797; RADC-TR-60-79.
Order from LC mi$3.60, ph$9.30 PB 147 357

A summary is presented of the status of a study program having as its objective the investigation of design techniques for UHF and microwave high-power filters. A brief account is presented of the levels of spurious radiation generated in high-power transmitters, the techniques for measuring the spurious outputs, the present Air Force specifications on tolerable interference levels, and a brief outline of some proposed and prototype high-power filters that can be used to reduce spurious outputs to tolerable levels. A summary is given of the results of a study of the reduced electric gradients within high-power filters with rounded rather than sharp corners. A number of dissipative filters are also described.

Stanford Research Inst., Menlo Park, Calif.
A LEAKY-WAVE ANTENNA WITH A CURVED APERTURE, by R. C. Honey and J. K. Shimizu. Scientific rept. no. 5 on Contract AF 19(604)3502. Feb 60, 28p. 4 refs. AFCRC-TN-60-197.
Order from LC mi$2.70, ph$4.80 PB 147 049

The design and the measured performance of a leaky-wave antenna whose radiating aperture is curved to fit flush with a 30-degree sector of a cylindrical surface are presented. The radius of curvature of the surface is about 46 inches, or 44 wavelengths at the design frequency. The aperture of this antenna is 18 inches in the E-plane with an arc length of 24 inches in the H-plane, and consists of an inductive sheet spaced over a conducting surface. The radiation patterns of this antenna were measured over the frequency range 8 to 13 kMc. At the design frequency, 11.42 kMc, the experimental results check extremely well with the theoretical predictions for a pencil beam 3.8-degrees wide in the H-plane by 3-degrees in the E-plane, tilted 55-degrees in the H-plane from the normal to the surface at the feed end of the antenna. (Author)

Stanford Research Inst., Menlo Park, Calif.
A SINUOUS FLUSH-MOUNTED FREQUENCY-INDEPENDENT ANTENNA, by J. K. Shimizu, E. M. T. Jones, and R. C. Honey. Scientific rept. 3 on Contract AF 19(604)3502. Oct 59, 27p. 8 refs. AFCRC-TN-60-126; AD-232 518.
Order from LC mi$2.70, ph$4.80 PB 146 012

The design and measured performance of a sinuous flush-mounted frequency-independent antenna are described. This antenna is an example of a class of antennas that has constant input impedance and constant pattern shape over an essentially unlimited frequency band. The pattern of the experimental printed circuit antenna is linearly polarized and has an almost constant beamwidth pattern oriented at a fixed direction in space, and operates over a frequency band limited only by the feed, extending from 3.2 to 16kMc. This antenna can easily be scaled to operate over other frequency bands, and even greater bandwidths of operation can be achieved by suitable modification of the feed design. (Author)

Stanford Electronics Labs., Stanford U., Calif.
A STUDY OF THE EMITTING-SOLE LINEAR MAGNETRON AMPLIFIER, by D. Chen. Rept. on Contract Nonr-225(24). 14 July 59, 121p. 37 refs. Technical rept. no. 207-1; AD-220 571.
Order from LC mi$6.30, ph$19.80 PB 147 099

A study of the linear emitting-sole magnetron amplifier is presented. A thick non re-entrant beam under Brillouin flow conditions, with the lower beam boundary in contact with the sole is explored. The transverse normalized susceptance of the beam, R_b, at the upper beam boundary is derived. Computations of the complex R_b as a function of the complex propagation constant, in the region of interest, for 3 typical frequencies are given. Four asymptotic forms of R_b to cover the entire complex plane of the propagation constant are derived. The wave solutions for matching the emitting-sole beam to free space and also to a conducting plate at 3 different distances above the beam are computed in detail through the use of these 4 asymptotic forms of R_b. Some discussions regarding the matching of the emitting-sole beam to a periodic circuit are given. The electronic efficiency of a reentrant-type emitting-sole beam is estimated and compared to that of a thin beam. An experimental amplifier is designed and constructed. It employs a smooth conducting plate as a circuit, facing an emitting-sole beam which fills up three-quarters of the spacing between the circuit and the sole. Results on the dc beam transmission test were satisfactory. (Author)

Sylvania Electronic Systems, Waltham, Mass.
OPTIMUM CODES STUDY, by R. Turyn. Final rept. on Contract AF 19(604)5473. 29 Jan 60, 39p. 9 refs. Rept. F437-1; AFCRC-TR-60-111.
Order from LC mi$3.00, ph$6.30 PB 146 909

This report is concerned with finding sequences whose terms are +1 or -1, or codes, and whose autocorrelation function is relatively small (except at zero). The main interest was in certain optimal codes (autocorrelation function not greater than 1 in absolute value except at zero). The main results are that no such optimum codes exist if of odd length exceeding 13. For even length, we are led to a consideration of certain periodic codes. Some important results are given on these. As a consequence, no optimum codes of even length less than 144 but greater than 4 exist. It thus seems likely no optimum codes other than those known exist. In addition, certain near-optimum codes are discussed. (Author)

Syracuse U. Research Inst., N. Y.
CHARACTERISTICS OF COUNTERWOUND HELICES, by Richard E. Gildersleeve. Task rept. no. 5 on Contract AF 30(602)1640. 15 Oct 58, 29p. 12 refs. SURI Rept. no. EE492-5810T5; RADC-TN-59-5; AD-208 287.
Order from LC mi$2.70, ph$4.80 PB 146 506

Antennas constructed of arrays of helices occupy considerable space when the standard fabrication techniques are used. If circularly polarized waves of either rotational sense are to be transmitted or detected the space requirements for the antennas more than doubles. In an attempt to reduce the space requirements to that of a single array a study was conducted to determine the feasibility of winding two helices, constructed to identical specifications except for rotational sense, coaxially and at the same distance from their common ground plane. Such a configuration of helices has been given the name "counterwound coaxial helices" or, more simply, "counterwound helices."

Syracuse U. Research Inst., N. Y.
DIAGNOSIS OF EQUIPMENT FAILURES, PART 1, by Richard A. Johnson and John D. Brule. Final rept. on Contract AF 30(602)1833. 15 Apr 60, 38p. 8 refs. SURI rept. no. EE-577-604F1; RADC-TR-60-67A.
Order from LC mi$3.00, ph$6.30 PB 146 785

A systematic method of finding efficient (near optimum) diagnostic procedures is discussed in some detail. This systematic method is based on a figure of

merit which insures that in each test of a defective equipment information is gained as inexpensively as possible. This paper summarizes the basic mathematical models and criteria for optimum procedures. Part I of this final report gives some results which indicate the effect of various maintenance procedures on the overall reliability of an equipment. In general, the maintenance procedures depend on the method of fault location (diagnosis) employed so that from this study one can compare the total effect of diagnostic procedures on the reliability of the equipment. The treatment is general in that it includes the treatment of redundant equipments.

Syracuse U. Research Inst., N. Y.
DIAGNOSIS OF EQUIPMENT FAILURES, PART 2, by Earl J. Kletsky. Final rept. on Contract AF 30(602)1833. 15 Apr 60, 82p. 2 refs. SURI rept. no. EE-577-604F2; RADC-TR-60-67B.
Order from LC mi$4.80, ph$13.80 PB 146 786

This portion of the final report deals with applications of the theoretical work. To illustrate this work a diagnostic procedure for a physical piece of electronic equipment has been prepared. A discussion of some practical matters to be considered in the application of the method are included. In addition, a computer program has been developed to establish a possible logical structure for the automatic calculation of diagnostic procedures. This program also demonstrates the feasibility of machine computation. (See also PB 146 785)

Syracuse U. Research Inst., N. Y.
A STUDY OF RECIPROCITY RELATIONSHIPS FOR GYROTROPIC MEDIA, by Alfred T. Villeneuve. Final rept. for 1 Sep 57-31 Aug 58 on Contract DA 30-115-ORD-861. 17 Sep 58, 89p. 17 refs. SURI Rept. no. EE509-589F; AD-205 708.
Order from LC mi$4.80, ph$13.80 PB 147 148

A modified reciprocity theorem is used in deriving a variational principle applicable to inhomogeneous, anisotropic media. Stationary expressions for resonant frequencies of cavities and propagation constants of waveguides are derived from this variational principle. Several examples of their use are included. A stationary expression for the electromagnetic field scattered by conducting obstacles in the presence of anisotropic media is also derived. A modified Green's function technique, applicable to anisotropic media, is discussed. The correct Green's function is that for media with tensor permeabilities and permittivities transposed.

Varian Associates, Palo Alto, Calif.
RESEARCH ON MOLECULAR AND ATOMIC RESONANCE DEVICES, by John C. Helmer. Final rept. on Contract DA 36-039-sc-73266. Dec 59, 52p. 1 ref. Engineering rept. 218-1F.
Order from LC mi$3.60, ph$9.30 PB 146 790

The goal of the solid state maser program has been to create a ferroelectrically tuned, zero field maser The crystal under study eventually proved to be unsuitable for this application, but the work itself led to a greater understanding of the ferroelectric state and of the influence of the ferroelectric state on magnetic ions within the crystal. The beam type maser program began with a study of noise in molecular beams. This was followed by a components investigation leading to design criteria for millimeter and submillimeter beam type masers. (See also PB 145 234)

Vitro Labs., West Orange, N. J.
PRODUCTION OF A SERIES OF NICKEL-CADMIUM BATTERY TESTERS, by A. W. Speyers, F. J. Keim and R. B. Naugle. Final engineering rept. for 18 Aug 55-30 Nov 58 on Contract DA 36-039-sc-64703. [1958] 72p. 2 refs. KLX-10137; AD-229 195.
Order from LC mi$4.50, ph$12.30 PB 146 788

Efforts were directed toward developing more accurate and convenient procedures and equipment for determining the state of charge of alkaline-type storage batteries and the condition of Le Clanche-type dry cells. A total of 22 battery testers of 4 different types were fabricated; the operating theory, physical description, operation, and performance of each tester type are discussed. One tester utilized the pulse discharge type of test with a maximum discharge current of 10 amp dc. A second tester was designed specifically to determine whether a BB-401/U battery coming from a trickle charge will deliver at least 75% of its rated capacity. A 10-amp discharge for 24 sec to detect imperfect cells is followed by an 84-sec pulsed charge at 5 amp. The increase of battery voltage between 20 and 84 sec of charge is used to indicate the state of charge. A third type is a multi-purpose tester designed for laboratory use; this unit incorporates a 60-sec charge, 60-sec discharge type of test with maximum pulsed charge and discharge currents of 50 amp average dc. A fourth tester was designed for use with higher capacity batteries capable of supplying discharge currents up to 1000 amp. The battery voltage drop free of ohmic voltage drop during discharge is obtained indirectly. The performance of the battery testers was generally satisfactory in indicating the condition or state of charge of batteries.

Washington U., Seattle.
FLUX CONCENTRATOR FOR HIGH-INTENSITY PULSED MAGNETIC FIELDS, by Y. B. Kim and E. D. Platner. Technical rept. on Contract Nonr-477(12). Apr 59, 40p. 13 refs.
Order from LC mi$3.00, ph$6.30 PB 146 840

Use of multiturn coil structure in the production of several hundred kilogauss pulsed fields is discussed with specific emphasis on coil life. The magnetic force that shortens the coil life is reduced by introducing a flux concentration device. Into the multiturn coil is inserted a rigid, slotted metal slug that generates induction current in such a way as to shift the magnetic flux from the multiturn to the central vacuum region and serves as a flux concentrator. Electromagnetically and mechanically this scheme is a convenient synthesis of the multiturn and single turn coils.

Westinghouse Electric Corp., Baltimore, Md.
HIGH TEMPERATURE MAGNETIC AMPLIFIERS (400 CYCLES PER SECOND). Rept. on Thermionics and Solid State Electronic Technology, Contract AF 33(616)5686. Feb 60, 121p. WADC Technical rept. 59-753.
Order from OTS $2.75 PB 161 762

Techniques and materials have been developed suitable for use in designing 400 cps magnetic amplifiers capable of satisfactory operation over an ambient temperature range of -65°C to +500°C. Amplifiers designed with these techniques and materials have the capability of withstanding temperature cycling as well as vibration at an intensity of 15 g from 70 to 2000 cps and an amplitude of 0.03 inch from 10 to 70 cps. The units may be operated at ambients of -65°C and +500°C during vibration.

Wiley Electronics Co., Phoenix, Ariz.
RESEARCH DIRECTED TOWARD THEORETICAL AND EXPERIMENTAL INVESTIGATION OF CORRECTED LINE SOURCE FEEDS, by Richard R. MacMillan and A. W. Love. Final rept. on Contract AF 19(604)5718. Feb 60, 182p. 2 refs. WER-93; AFCRC-TR-60-122.
Order from LC mi$8.40, ph$28.80 PB 147 054

This final report contains detailed design, construction, and test data on a K_a-band spherical reflector with a beamwidth of 20 minutes of arc. Problems encountered during the program, together with the engineering approach used for their solutions, are also discussed. Finally, the performance of the antenna is evaluated. (Author)

Army Chemical Warfare Labs., Army Chemical Center, Md.
INVESTIGATION OF YELLOW DYES FOR USE IN THE M18 COLORED-SMOKE GRENADE, by Woodrow W. Reaves, Kenneth G. Carlon, and John E. Andrews. Jan 60, 11p. CWLR-2336; AD-231 128.
Order from LC mi$2.40, ph$3.30 PB 146 862

The current standard M18 yellow-smoke grenade is unstable and hazardous to load. Production records of the U. S. Army Chemical Corps Materiel Command indicate that loading hazards result from the sensitivity of the smoke formulation, which contains auramine hydrochloride as the dye ingredient, and that operational failures have occurred after the grenades have been stored at 160°F. Previous investigation of the storage characteristics of the grenade at higher temperatures strongly indicate that the operational failures could be attributed to the instability of the dye. It was concluded that a mixture of 35±5% dibenzo[a, h] pyrene-7, 14-dione and 65±5% 7H-benz[d, e] anthracen-7-one produced a colored smoke comparable to that formed by the auramine hydrochloride formulation now in current use. The commercial dye CS2171 also produced a suitable color. (Author)

EPHEMERIS FOR EXPLORER IV: 1958 EPSILON, by R. M. Adams (Smithsonian Astrophysical Observatory). Issue no. 3 on Orbital Data Series. 16 Sep 58, 393p. AD-202 688.
Order from LC mi$11.10, ph$60.60 PB 147 590

Positions of Explorer IV, 1958 Epsilon at 1-min intervals from 13 August thru noon, 27 August are listed. Baker-Nunn photographs (rough reductions), minitrack, microlock, moonwatch, and a few radar observations were used in preparing the ephemeris. The ephemeris given positions of subsatellite points in geographic latitude and longitude. A subsatellite point is defined as the intersection of the radius Vector with the international ellipsoid. Thus, the heights given are the actual distances between the satellite and the subsatellite points. All longitudes given are degrees east and heights are in kilometers. Positions listed in this report are accurate to better than ±0.25°, using time as the independent variable. Heights are within an accuracy of 10 km.

Arnold Engineering Development Center [Tullahoma, Tenn.]
ANNULAR NOZZLES FOR MISSILE BASE FLOW TESTING, by C. E. Peters. Rept. on ARO, Inc., Contract AF 40(600)800. May 60, 25p. 2 refs. AEDC-TN-60-62.
Order from LC mi$2.70, ph$4.80 PB 147 330

A simplified method of designing axisymmetric annular nozzles is presented. Tabulated supersonic nozzle contours are used, and the centerbody contours are chosen to conform to stream surfaces in the nozzle flow field. Calibration data obtained from 6-in. model nozzles and from a family of 36-in. exit diameter nozzles indicate that a properly contoured centerbody has no adverse effect on flow quality. The use of annular nozzles is a feasible approach to the simulation of supersonic flow past missile model afterbodies. (Author)

PERTURBATIONS OF A TWENTY-FOUR HOUR SATELLITE ORBIT, by Don Lautman. Rept. on Contract AF 04(647)278. Mar 59, 14p. Research rept. 43.
Order from LC mi$2.40, ph$3.30 PB 147 200

An investigation has been started to determine the orbit changes of an artificial satellite which is essentially stationary with respect to the surface of the Earth. The interest in this problem is based on the 24-hour communication satellite. The essential results contained in this paper are tabulated.

Ballistic Research Labs., Aberdeen Proving Ground, Md.
COMPILED FREE-AIR BLAST DATA ON BARE SPHERICAL PENTOLITE, by H. J. Goodman. Feb 60, 46p. 27 refs. Rept. no. 1092.
Order from LC mi$3.30, ph$7.80 PB 147 051

Free-air blast parameters (peak pressure, positive impulse and positive duration) from the detonation of

spherical 50/50 Pentolite charges fired at sea level conditions have been compiled. Analytic expressions for side-on pressure, side-on positive impulse and normally reflected impulse have been determined by fitting least squares polynomials to the data. The function for side-on pressure extends over all scaled distances where pressure might be of military importance, and is of the asymptotic form given by Krikwood and Brinkley. (Author)

Ballistic Research Lab., Aberdeen Proving Ground, Md.
ON THE ASYMPTOTIC BEHAVIOR OF CERTAIN ONE-DIMENSIONAL FLOWS, by J. H. Giese. Mar 60, 49p. 4 refs. Rept. no. 1098.
Order from LC mi$3.30, ph$7.80 PB 147 485

A theoretical aspect of the efflux of gas from a tube, open at one end, has been studied. Dr. W. C. Taylor has conjectured, loosely speaking, that regardless of the initial state of the gas, the asymptotic behavior for large t is of the known form $u(x,t) \sim f(x)/t$ and $c(x,t) \sim g(x)/t$, u and c being particle velocity and speed of sound. His conjecture was confirmed by fairly elementary means for $\gamma = 3$. Subject to an additional physically plausible monotonicity assumption, it has also been verified for the considerably harder case $\gamma = 5/3$. The latter problem was reduced eventually to determining the asymptotic behavior of the solutions of an integro-difference (or equivalently differential-difference) equation. (Author)

HYDROGEN-OXYGEN FUEL ELECTROLYTIC BATTERY CONTAINER STUDY, by James R. DeHaan and Marshall Piccone. Rept. on Contract AF 33(616)5833. Oct 58, 106p. 37 refs. Engineering rept. 6152; WADC Technical rept. 58-542; AD-203 521.
Order from LC mi$5.70, ph$16.80 PB 147 268

This report is a study of various methods of storing oxygen and hydrogen for use in hydrogen-oxygen fuel electrolytic cells in a zero-gravity environment, and to determine analytically the optimum storage techniques for a family of such cells. Various insulation methods were studied and their applicability to specific missions are discussed. Graphs are presented showing storage system weight as a function of duration and fuel cell power output, and watt hours of power obtainable per pound of storage system, also as a function of duration and fuel cell power output. The theoretical basis of a method of phase separation suitable for the operation of the low pressure storage systems in a weightless environment has been derived.

ADHESION TEST FOR GRADE C GREASEPROOF BARRIER MATERIALS, by Mario E. Gigliotti and John H. Mazzei. Apr 60, 17p. 6 refs. Technical rept. 2679.
Order from LC mi$2.40, ph$3.30 PB 145 518

Experiments demonstrated that an adhesion test of Grade C barrier materials based on the principle of sticking one specimen to another was not desirable. Results of such tests were not reproducible because the surfaces of the Grade C materials were not homogeneous (waxes were dissimilar, thread counts in the cottonscrim were inconsistent, etc.). A test was therefore developed in which a Grade C specimen was adhered to an aluminum panel and the force necessary to separate the specimen from the panel was measured measured. The use of the aluminum panel with its smooth, continuous, homogeneous surface gave reproducible results. A ranking of values obtained in the newly developed adhesion test was compared with a ranking based on the results of a personal opinion survey conducted among packaging personnel at Rossford Ordnance Depot and at Picatinny. The results of this study correlated significantly with the results of the laboratory adhesion test. It was therefore concluded that this adhesion test is completely satisfactory for specification purposes. (Author)

ANALYSIS OF EXPLOSIVES BY INFRARED SPECTROSCOPY, by Frank Pristera, Michael Halik and others. May 56, 65p. 27 refs. Technical rept. 2254.
Order from LC mi$3.90, ph$10.80 PB 147 594

A compilation of 68 infrared spectrograms covering all common high explosive compounds and many possible explosive ingredients, additives, and related compounds has been prepared. An examination of the prepared spectrograms has made possible the empirical deduction of several new band assignments, notably 9.25 microns for the symmetrical trinitro aromatic configuration and 11.0 microns for the meta dinitro aromatic configuration. These should facilitate the infrared structural investigation of unkown ingredients such as newly synthesized compounds. Extensive detailed descriptions have been presented for the preparation and qualitative use of infrared spectrograms of the explosive ingredients. Considerable information has been presented regarding the qualitative and quantitative analyses of mixtures of explosive ingredients by infrared and/or other methods. (Author)

THE CHEMISTRY OF HEXAMETHYLENETETRAMINE IN AN ACIDIC AQUEOUS MEDIUM, by Thomas C. Castorina, James W. McCahill and others. Apr 60, 37p. 13 refs. Technical rept. 2674.
Order from LC mi$3.00, ph$6.30 PB 144 634

The behavior of hexamethylenetetramine (Hexamine) in an acidic aqueous medium was studied from two aspects. One aspect was the decomposition of the compound to formaldehyde and ammonium ions and the influence of parameters such as concentration, acidity, and added formaldehyde on this decomposition process. The other was the exchange of methylene groups between hexamine and formaldehyde during hydrolysis equilibrium and the effect of concentration, pH, and temperature on the rate of this exchange. It was observed that the addition of formaldehyde to dilute aqueous acidic solutions of hexamine represses the hydrolysis of the material and that the degree of repression is governed by the enhanced basicity of the hexamine-for-maldehyde solution as well as by Le Chatelier's law. The exchange of methylene groups between hexamine and formaldehyde in acid solution was studied with carbon-14 tagged reagents. The rate of exchange was observed to increase proportionately with reagent concentration, acidity, and temperature. The relationship of these results to the behavior of hexamine in the nitrolysis to HMX and RDX is discussed briefly. (Author)

Feltman Research and Engineering Labs., Picatinny Arsenal, Dover, N. J.
DEVELOPMENT OF TRACER FOR THE 37mm T324E22 SHELL (VIGILANTE) by Ralph B. Wright. May 60, 8p. 1 ref. Technical notes no. 45.
Order from LC mi$1.80, ph$1.80 PB 146 216

This report describes the development work on a 7-second tracer for the 37 mm T324E22 shell up to the time of acceptance by the user, the developer of the shell. For reasons of urgency, compromises had to be imposed upon this development program. As a result the subject tracer is not considered to be an optimum design. This tracer was developed empirically by varying composition, column size, and types of tracer compositions. The accepted design maintains the exterior configuration of the standard closure plug except that 1/4 inch was added to the rear face. The tracer cavity, 1/2 inch in diameter and 1 inch deep, contains R-45 type tracer composition and K-29 type igniter composition, both of which are consolidated at 100,000 psi. When tested ballistically the tracer produced results that were considered acceptable by the user. (Author)

EFFECTS OF MAGNESIUM CONTENT CASE MATERIAL, AND CASE COATING ON BURNING CHARACTERISTICS OF A FLARE SYSTEM, by Anthony F. Taschler and Seymour M. Kaye. Apr 60, 19p. Technical notes no. 42.
Order from LC mi$2.40, ph$3.30 PB 144 829

The luminosity levels of flare systems consisting of magnesium (100/200 mesh) sodium nitrate, and Laminac 4116 increase with increasing magnesium content, up to the 70% fuel level. The burning rates of such compositions also increase with increasing magnesium content, up to the 65-66.7% fuel level, but drop when the fuel level is further increased (up to 70% in this investigation). The above findings are based on the results of evaluations of several magnesium/sodium nitrate/Laminac 4116 compositions conducted at Picatinny in tracking flare tubes of the T131 type. Various coatings - wax, Laminac, and Thiokol - were used on the tubes, and found to have no significant effect on either luminosity or burning rate. Similar evaluations of compositions FY965, FY966, FY976, and FY977 indicated that, when coarser magnesium is used, both the luminosity level and the burning rate are reduced. (Author)

EVALUATION OF NEW SOURCES OF NITROCELLULOSE IN M8 PROPELLANT, by Vladimir Mirko. Mar 60, 15p. 9 refs. Technical rept. 2677.
Order from LC mi$2.40, ph$3.30 PB 144 828

The sources of woodpulps suitable for manufacturing nitrocellulose were increased when it was shown that nitration of a sulfate woodpulp and of a sulfite woodpulp containing 15% hardwood produced acceptable military grades of nitrocellulose. Nitrocellulose prepared from these pulps was evaluated in M8 mortar propellant as part of a broader program to determine whether such nitrocellulose is suitable for use generally in standard propellants. Accordingly, lots of 60 mm M3A1 mortar increments were prepared from M8 propellant containing the experimental lots of nitrocellulose and compared, in ballistic and physical properties, with production lots of increments containing nitrated cotton linters. It was found that the characteristics of the experimental propellants were equivalent to those of the production lots. (Author)

Feltman Research and Engineering Labs., Picatinny Arsenal, Dover, N. J.
MEAN PRESENTED AREA OF SMALL STEEL FRAGMENTS MEASURED BY MEANS OF FREE FALL IN A VISCOUS FLUID; by I. H. Stein. Oct 58, 34p. 9 refs. Technical memo. no. 127A53; AD-207 094.
Order from LC mi$3.00, ph$6.30 PB 147 152

The mean presented areas of small irregular shaped steel fragments, within and beyond the lower limit of the icosahedron gage, were measured by a new method. This technique, based upon the free fall of a fragment in a viscous fluid and the fragment weight, yields results comparable in accuracy to the icosahedron gage; an average deviation of 4.3% and a maximum deviation of 10% from true values were observed. For fragments below 30 grains, an empirical expression for presented area was determined. (Author)

A GEODETIC COORDINATE SYSTEM FOR ASKANIA CINETHEODOLITES, by R. J. Stirton. 1 Feb 60, 36p. 3 refs. NOTS TP-2427; NAVORD rept. 7038.
Order from LC mi$3.00, ph$6.30 PB 147 124

It is proposed to use a geodetic coordinate system (geodetic latitude and longitude, and elevation above sea level) to describe positions of Askania cinetheodolites. For small ranges of say 20 miles extent a plane-grid coordinate system is satisfactory, but if the range is extended to some hundreds of miles or if several ranges are used in conjunction it appears more practical to use geodetic coordinates for cinetheodolite positions. Cinetheodolites measure azimuth and elevation angles with respect to the north and the local vertical. Synthesis of cinetheodolite observations to a position or trajectory requires that the positions of the cinetheodolites and the azimuth and elevation angles be transformed to some common reference frame. The common reference frame used here may be either a geocentric system or a topocentric system centered at a cinetheodolite station or other convenient point on the earth. The necessary transformations for bringing the azimuth and elevation and the cinetheodolite positions into the common coordinate system are developed in detail.

Naval Ordnance Test Station, China Lake, Calif.
A METHOD FOR TESTING MISSILE COMPONENTS IN A CONTROLLED ENVIRONMENT OF HIGH-INTENSITY SOUND, by Eldon Sparrow. 11 Feb 57, 15p. NOTS 1677; NAVORD rept. 5418.
Order from LC mi$2.40, ph$3.30 PB 147 009

High-intensity acoustic noise (intensity greater than 100 db) produced by a missile's propulsion unit can be detrimental to electronic components in the missile and hence result in greatly reduced reliability. To ascertain whether or not the noise level would affect sensitive relays in a particular missile's control unit, the characteristics of the sound from the propulsion unit were recorded and reproduced at the

appropriate intensity, and the relays were subjected to this effect within a closed chamber approximating the control section of the missile. The relays were unaffected and their use was justified. The test setup for this study is described in detail, and a brief report is made on the hazards experienced in working with high-intensity sound. (Author)

Naval Ordnance Test Station, China Lake, Calif.
TECHNIQUES FOR THE STATISTICAL ANALYSIS OF CINETHEODOLITE DATA, by R. C. Davis. 22 Mar 51, declassified 2 Oct 54, 24p. 6 refs. NOTS 369; NAVORD rept. 1299.
Order from LC mi$2.70, ph$4.80 PB 147 269

The problem of obtaining an estimate of missile position from an overdetermined system of cinetheodolite observations subject to error is formulated as a problem in the now classical theory of least squares. Previous methods of data reduction based on the minimization of certain quadratic forms cannot be formulated statistically within the framework of the theory of least squares. Moreover, if the cinetheodolite angles are normally distributed, the least squares estimate obtained coincides with the maximum likelihood estimate of missile position. From the ensemble of angular observations it is possible to obtain unbiased estimates of the terms appearing in the variance-covariance matrix of the three coordinates of missile position. A criterion for the optimum location of cinetheodolite stations is developed. Several illustrative examples of the general theory are given. In particular, the examples of the application of the criterion for the optimum location of stations prove that slant ranges as well as angles of intersections are important. (Author)

TECHNICAL RESOURCES DIRECTORY: MISSILE GROUND SUPPORT EQUIPMENT, NO. 2. 1 May 60.
Order from OTS $0.50 PB 161 535

Through its extensive research and engineering programs, the Department of Defense is developing material and equipment designed to meet present and future military requirements. The diverse tasks embraced in these programs range throughout the broad scope of military activities. This directory of military technical resources is intended to encourage communication in the Military Departments and in industry in the area of ground support equipment for missile systems. (Supersedes issue no. 1, 1 Nov 59, PB 161 103)

Pacific Missile Range, Point Mugu, Calif.
PAY LOAD LOSS FOR EQUATORIAL ORBITS DUE TO NON-EQUATORIAL LAUNCHES, by M. M. L. Eaton and M. A. Garcia. 29 July 59, 85p. 3 refs. Technical memo. no. PMR-TM-59-4.
Order from LC mi$4.80, ph$13.80 PB 147 384

In addition to the latitude of the launch site, five key parameters are involved in the calculations. These are: fuel specific impulse, rocket structural factor, altitude of desired orbit, range to apogee of preliminary rocket trajectory, and ratio of the apogee to the circular velocity. Of the two models analyzed the apogee transfer is generally preferable to the circular orbit transfer case. (See also PB 147 383)

Pacific Missile Range, Point Mugu, Calif.
PAY LOAD LOSS FOR EQUATORIAL ORBITS DUE TO NON-EQUATORIAL LAUNCHES, by Max L. Eaton and Manuel A. Garcia. 2 Apr 59, 16p. Pub. no. PMR-MP-59-13.
Order from LC mi$2.40, ph$3.30 PB 147 383

This report estimates a penalty for producing equatorial satellite orbits from launch sites off the equator. The penalty concerns the decrease in pay load compared to launches from the equator. Two methods of obtaining an equatorial orbit from a non-equatorial launch site have been considered; namely, "apogee transfer" and "orbital transfer."

Rock Island Arsenal Lab., Ill.
ALUMINUM ALLOYS FOR RECOIL MECHANISM CYLINDERS, by F. Blessin. 17 Mar 60, 26p. 9 refs. Rept. no. 60-798.
Order from LC mi$2.70, ph$4.80 PB 146 906

Wear and friction tests were conducted with currently used recoil mechanism packing materials sliding on steel and high strength aluminum alloys. It was found that the aluminum alloys were less compatible with the packing materials than was the steel now used for recoil mechanism cylinders. Weight and expansion due to internal pressure were calculated for aluminum cylinders equal in strength to steel cylinders at a temperature of 300F. It was found that no savings in weight would be obtained by the use of aluminum and that expansion of aluminum cylinders would be greater than that of steel cylinders. (Author)

Springfield Armory, Mass.
BASIC SYSTEMS CONCERNING SLIDE ENERGY OF OPEN-SYSTEM, GAS-OPERATED WEAPONS, by F. M. Chakour. Rept. on Design Studies and Evaluation for Weapons and Related Materiel for Ground Roles. 26 Feb 59, 44p. SA-TR20-9000.
Order from LC mi$3.30, ph$7.80 PB 146 837

A study was made in order to determine the relationship of available slide energy to the following parameters: orifice location, orifice diameter, initial cylinder volume, piston diameter, piston stroke, weights of recoiling parts. A test fixture was used to obtain experimental data. Correlation of these data was made. Procedure is described, and results discussed. (Author)

INTERACTIONS OF RAPIDLY MOVING BODIES IN TERRESTRIAL ATMOSPHERE, by K. P. Chopra. Technical note on Contract AF 18(603)95. 31 Mar 60, 153p. 103 refs. USCEC rept. 56-212; AFOSR-TN-60-398.
Order from LC mi$7.50, ph$24.30 PB 147 300

The phenomena concerning the interactions of rapidly moving bodies in an ionized medium pervaded by a magnetic field are described in this report. This study has a special bearing on the motion of artificial earth satellites. The various phenomena are divided into four classes. The first category of phenomena concerns the interaction of the body with neutral particles. These phenomena form a part of the area called 'aerodynamics' and the recent theoretical work in this particular area is reviewed in Chapter II. The second group of phenomena deals with the generation of electrical currents induced in the moving body or the surrounding medium (or both) by the relative motion of the conducting material and the magnetic field. The third class of phenomena is due to the body's acquiring an electric charge due to the accretion of charged particles and the photo-electric effect of the solar radiation, and the consequent Coulomb interactions between the charged body and the charged particles. This class of phenomena forms the subject matter for Chapters III and IV. The motion of the charged body in the terrestrial atmosphere is capable of exciting various wave phenomena. Three kinds of waves are described: plasma oscillations in the wake of the body (Kraus-Watson), extraordinary electromagnetic waves (Chopra-Singer), and magneto-hydrodynamic waves due to the interaction between the induced motion of an ionized column ahead of the body and the transverse component of the terrestrial magnetic field. These wave mechanisms are discussed in Chapter VI. Chapter VII reviews the theoretical studies contained in Chapters II through VI, and the pertinent observational material on the upper atmosphere observed by the artificial earth satellites.

Watertown Arsenal Labs., Mass.
CRACK DEPTH LEAKAGE FLUX CHARACTERISTICS IN FERROMAGNETIC MATERIALS, by Patrick C. McEleney. Apr 60, 47p. 9 refs. Technical rept. no. WAL TR 148.1/1.
Order from OTS $1.25 PB 161 513

Specimens of six fired gun tubes of varied chemistry and heat treatment, with simulated cracks, were examined with a magnetic recording borescope to determine the minimum magnetization level for adequate sensitivity in crack detection. Little improvement in sensitivity is realized by magnetization levels above 1600 ampere turns and no improvement in scatter of data over that of previous data was noted. (Author)

COLD WEATHER TESTS ON PNEUMATIC SHELTER RAFT, (MFG. BY AIR CRUISERS, DIVISION OF GARRETT CORP.), by Harold L. Donley. July 57, 13p. Technical note AAL-TN-57-18.
Order from LC mi$2.40, ph$3.30 PB 147 289

Cold weather habitational suitability tests were conducted on the global shelter-raft, pneumatic, 20-man, under arctic and subarctic conditions. The objectives of the cold weather tests were to determine its suitability as (1) an emergency cold weather shelter for downed airmen; (2) an aerial delivered global item of rescue equipment; (3) an emergency para-rescue shelter; (4) and a temporary shelter for persons doing isolated work in the Arctic.

Arctic Aeromedical Lab., Ladd AFB, Alaska.
TESTING AN INCINERATOR TOILET FOR GROUND USE, by Lester Baribo. Apr 57, 11p. Technical note AAL-TN-57-6.
Order from LC mi$2.40, ph$3.30 PB 147 288

Army Engineer Research and Development Labs., Fort Belvoir, Va.
USE OF CORPS OF ENGINEERS MOBILE WATER PURIFICATION UNIT AND AUXILIARY PROCESSES FOR DESTROYING BACTERIAL SPORES IN COLD WATER, by Paul B. Pruett and Don C. Lindsten. Rept. for Jan-Feb 55. 29 Jan 59, 47p. 3 refs. Rept. 1564-TR; AD-213 126.
Order from LC mi$3.30, ph$7.80 PB 146 246

A series of field experiments were conducted at Camp A.P. Hill, Virginia, to investigate methods of destroying chlorine-resistant bacterial spores when added to a cold surface water supply. Non-pathogenic Bacillus subtilis var. niger was used as the test organism. A field method of superchlorination (100 ppm), acidification to a pH value of less than 7.0, dechlorination with 600 ppm activated carbon followed by normal treatment with the Army's Mobile Water Purification Unit, was found satisfactory for destruction of the bacterial spores. The tests showed that the following treatment methods were ineffective: (1) superchlorination (100

ppm), chlorine-contact period (95 min), and pH greater than 8.5; (2) coagulation and diatomite filtration without chlorination in the Mobile Water Purification Unit; (3) prechlorination (1.0 ppm) and diatomite filtration without coagulation in the Mobile Water Purification Unit; (4) prechlorination (1.0 ppm), coagulation, and diatomite filtration with the Army's Mobile Water Purification Unit; and (5) preheating water from 40° to 97°F, prechlorination to 1.0 ppm, coagulation, and diatomite filtration. SHOP PRACTICE SUGGESTIONS. [1959] 31p.
Order from OTS $0.50 PB 161 715

These are employee suggestions that were of sufficient importance to be published in the Bureau of Ships Journal for the benefit of all Bureau of Ships facilities and employees.

Bureau of Yards and Docks, Washington, D. C.
DRYDOCKING FACILITIES. VOLUME 3. DATA BOOK. 1 Feb 55, 284p. Technical Pub. NAVDOCKS TP-Pw-10.
Order from OTS $4.00 PB 161 744

This publication, issued in three volumes, presents the current policies, practices, criteria, and technical data used by military and civilian personnel concerned with the Navy's drydocking facilities. Volume 3 presents technical data in summary form on the principal characteristics and features of existing facilities. (See also PB 151 759)

David Taylor Model Basin, Washington, D. C.
COMPARATIVE RESISTANCE DATA FOR FOUR PLANING BOAT DESIGNS, by Eugene P. Clement and Peter M. Kimon. Jan 57, 27p. 2 refs. Rept. no. 1113.
Order from LC mi$2.70, ph$4.80 PB 146 946

Four existing models of planing craft were retested at the Taylor Model Basin's "standard condition" for planing boat models. The test results for each model are presented in a design data sheet. The data are compared to show the effects of differences in hull form. These comparisons are independent of differences in hull loading, in LCG location, or in size of boat. Auxiliary graphs are included to assist in making estimates of speed and power for new designs. (Author)

DYNAMIC TESTS OF ALUMINUM BEAMS, by J. R. Allgood and S. K. Takahashi. Final rept. 22 Mar 60, 28p. 5 refs. Technical rept. 078.
Order from LC mi$2.70, ph$4.80 PB 147 117

Three built-up 5456-H311 aluminum alloy beams, with a clear span length of 8 ft 1-3/8 in. and restrained ends, were subjected to uniformly distributed static and dynamic loading. One of the members, tested statically to a 21.6 psi sustained load, buckled at the web. The other two members, subjected to blast loads with peak overpressures of 18.2 psi and 18.5 psi, also buckled at the web. Results are given, dynamic response of the members is discussed, and a design criterion based on a limit deflection of L/50 is proposed. According to the suggested criterion, the alloy and section used have inferior blast load resistance. (Author)

DETERMINATION OF A GENERAL INDEX OF EFFORT IN SORTING MAIL BY CONVENTIONAL METHODS, by Seymour Henig. June 60, 9p. 1 ref. Technical note 54.
Order from OTS $0.50 PB 161 555

The conventional method of sorting letters in stages is described. It is shown, through reference to available statistics, that about 90% of letters originating within the areas served by several large post offices will be involved in no more than five stages to be completely sorted to a carrier, firm or section of boxes. A method is presented for the accounting of each stage's individual letter readings which are defined as the units of measurement for the index of sorting effort. It is found that the upper bound average number of readings per letter for three large post offices varies from 3.16 to 2.98 and that these bounds are applicable to 96.2 to 92.4% of the local originating first class letters. It is anticipated that the values of such indexes for all large post offices will be consistently close to the range already determined. (Author)

National Bureau of Standards, Washington, D. C.
MAGNETIC DRUM DIRECTORY AND PROGRAMMING SYSTEM FOR CODESORTING LETTER MAIL, by Peter C. Tosini. June 60, 51p. 2 refs. Technical note 50.
Order from OTS $1.75 PB 151 409

The purposes of this report are: (1) to examine the major concepts involved in designing a magnetic drum directory and programming system for coded-address sorting ("codesorting") letter mail in general; and (2) to develop these through modifications and extensions to accommodate local and outgoing sorting for the Washington, D.C. Post Office in particular. It is restricted to one distributor separating local mail to carriers and "directs" (destinations receiving large volumes of mail), and outgoing mail to cities and "state residues" (alphabetic ranges of cities within a state). The specialized problems encountered in multi machine and multi-pass sorting, sorting to carrier walk, and sorting to time-varying destinations are not discussed.

Stanford Electronics Labs., Stanford U., Calif.
A DYNAMICALLY-ADJUSTABLE CHUCK MOUNTING FOR CENTERING WORK IN A GLASSBLOWING LATHE, by H. A. Meneses and M. D. Hare. Rept. on Contract DA 36-039-sc-73178. 17 Oct 58, 13p. Technical rept. no. 453-2.
Order from LC mi$2.40, ph$3.30 PB 137 915

This report describes a mechanism which fits between the spindle and chuck of a glassblowing lathe and permits centering the work by lateral motion of the chuck with the lathe in operation. It also allows the work to be offset by a small measured amount. (Author)

HIGH TEMPERATURE BEARING LUBRICATION WITH ADDITIVE FUELS, by A. Lockwood. Phase 1 rept. on Project TED-NAM-PP5206. 18 Jan 57, 23p. NAMC-AEL-1487; AD-121 959.
Order from LC mi$2.70, ph$4.80 PB 146 503

A method of providing lubrication for gas turbine engine bearings at operating temperatures up to 650°F is under investigation. This method utilizes as a lubricant JP-5 fuel (for cooling purposes) containing test additives (for lubrication purposes). The additives tested were tricresyl phosphate, dibenzylsulphide and molybdenum disulphide. Satisfactory bearing operation at a no-load and 650°F operating condition was obtained with the use of the tricresyl phosphate additive. (Author)

Order from LC mi$3.30, ph$7.80 PB 146 900

Contents: Electromagnetic pinch research; Preliminary design of an integrated space vehicle propulsion system; Ion propulsion at Rocketdyne; Charged colloid propulsion; Surface emission of positive ions; Micron size particles for electric propulsion; Compact charge ionization; Heavy particle propulsion; Ion in rocket combustion; Heat transfer from arc heated gases; Electromagnetic plasma propulsion studies; Design studies on the XE-701 ion engine; Investigation of ion thrust devices; Initial ionization process in gases; Small plasma jet propulsors; Hi intensity plasma jets; Acceleration in channeling of plasma jets by magnetic fields; Pulsed plasma propulsion; Aerodynamic applications of plasma wind tunnels; Studies on propulsion of plasma; Plasma acceleration by non-uniform RF fields; Crossed field acceleration of ions and plasmas; Injection into a linear plasma accelerator; High temperature MHD experiments; Realization of magnetohydrodynamic propulsion; Continuous magnetic acceleration of arc plasma; Low temperature plasma jet; Thermophysical properties of magnetohydrodynamic plasmas; Magnetohydrodynamic waves; Gasdynamics of plasma; Bounday layers in plasma accelerators; Heat transfer from an ionized gas to a gaseous coolant; C_8 solid propellant; Properties of ions in flames; Ion rocket sputtering and neutralization studies.

Bureau of Yards and Docks, Washington, D. C.
POWER GENERATION AND DISTRIBUTION. CHAPTER 5. INTERNAL COMBUSTION ENGINES; MAINTENANCE AND OPERATION. 15 Dec 53, 64p. 7 refs. Technical Pub. NAVDOCKS TP-Pu-3.
Order from OTS $1.75 PB 161 743

Chapter 5 deals with stationary internal combustion engines for power purposes. It gives operating instructions; measures for preventive maintenance, including inspection, safety precautions, and trouble shooting; and the log for performance and maintenance data. Fuel and lubricants are discussed, as well as fuel, lubricating, cooling, and starting systems. (See also PB 161 358)

Kennametal, Inc., Latrobe, Pa.
RESEARCH ON TITANIUM CARBIDE TURBINE WHEELS AND FABRICATION OF TWO SLOTTED SPIN TEST WHEELS. Final rept. on Contract Nonr-1680(00). 22 June 59, 15p. AD-220 566.
Order from LC mi$2.40, ph$3.30 PB 146 477

The fabrication of 2 spin test turbine wheels of TiC composition is described. One wheel was of K164B composition throughout, and the other was a composite wheel with K164B at the hub and K162B at the rim containing the blade sections. Ball-milled powders were packed in rubber envelopes, shaped approximately to the over-all shape of the finished part, and hydrostatically pressed with the large explosive pressing chamber. The pressure was about 35,000 psi. The slugs were presintered, machined, sintered, and ground to final dimensions, with adjustments in dimensions to obtain static balance. The composite wheel was made by forming and sintering the hub and rim sections separately, grinding, and furnace welding them together.

Little, Arthur D., Inc., Cambridge, Mass.
ALKALI METALS AS PROPELLANTS, by Alfred Buchler and Joan Berkowitz. Final rept. for 29 Apr 58-31 Aug 59 on Energy Transfer Research, Contract AF 29(600)1625. Nov 59, 99p. 143 refs. AFMDC-TR-59-40.
Order from LC mi$5.40, ph$15.30 PB 146 011

The available thermodynamic data for gaseous LiF, NaF, LiCl, NaCl, Li_2O, LiOH, NaOH, and their

dimers, are critically discussed and tables of thermodynamic functions based on these data are given. There appears to be no advantage in the use of alkali metal solutions or dispersions as propellants.

Poulter Labs., Stanford Research Inst., Menlo Park, Calif.
THE STUDY OF THE ORIGIN AND PROPAGATION OF DISTURBANCES IN THE BURNING OF SOLID PROPELLANTS, by G. A. Agoston. Summary rept. for 1 Feb 59-1 Feb 60 on Contract AF 49(638)565. 17 Feb 60, 28p. 33 refs. SRI Proj. GU-2770; AFOSR-TN-60-336.
Order from LC mi$2.70, ph$4.80 PB 147 312

A program has been undertaken to study the behavior of shock waves in the region of steep temperature gradients close to a burning solid propellant surface. The objective is to reveal underlying mechanisms which play significant roles in solid propellant combustion instability. Attempts have been made to observe photographically the behavior of a shock wave near a burning solid propellant surface, near a burning monopropellant (liquid ethyl nitrate) surface and in the region of a flat ethylene-air flame. The photographs obtained with solid propellants are not revealing. Much more readily interpretable pictures were obtained with the ethyl nitrate and the ethylene-air flames. The schlieren photographs obtained of shock waves introduced in a direction parallel to the surface illustrate the distortion and stretching of the shock wave which occurs. Further tests are recommended to reveal the various effects which may occur and to serve as a basis for a proposed theoretical analysis of the phenomena. (Author)

Machine Parts and Mechanisms

Aeronautical Materials Lab., Naval Air Material Center, Philadelphia, Pa.
THE EFFECTS OF NUT MATERIALS AND LUBRICANTS ON THE SEIZING AND CALLING CHARACTERISTICS OF TITANIUM BOLT THREADS, by Joseph Viglione. 6 Dec 56, 56p. 1 ref. Project TED NAM AE 6244.3; NAMC-AML-AE-1023; AD-127 166.
Order from LC mi$3.60, ph$9.30 PB 146 502

The effects were determined of various lubricants and surface treatments on the seizing and galling characteristics of titanium bolts assembled with titanium alloy, stainless steel, and aluminum alloy nuts. The relaxation characteristics of 1/4" titanium alloy bolts compared quite favorably with those of similar steel bolts, even at extremely high loads approaching the yield strength.

Naval Engineering Experiment Station, Annapolis, Md.
FRICTION TESTS OF TEFLON BEARING MATERIAL, by W. J. Kommers. 7 June 57, 15p. Research and Development rept. 090017A; AD-206 939.
Order from LC mi$2.40, ph$3.30 PB 147 034

The frictional characteristics of presently used stern tube and strut bearing materials are compared with samples of Teflon impregnated glass cloth laminates. The other materials include phenolic impregnated cotton cloth laminates (plain and with MoS_2) and lignum vitae wood. Static and kinetic sliding friction tests were made under dry and water lubricated conditions, and all bearing samples were tested against both bronze and Monel journal specimens. The tests are limited because of the small size of the Teflon samples provided. The coefficients of friction of the Teflon samples were lower than those of the other materials under the dry running tests and the static tests. With water lubrication, all materials had approximately the same kinetic friction coefficients. Investigations of the abrasive wear resistance and the cold flow characteristics of Teflon are recommended prior to making simulated bearing performance tests. (Author)

BEARINGS 1945-1960. Apr 60, 17p. 294 refs. OTS Selective Bibliography SB-410.
Order from OTS $0.10 OTS SB-410

A bibliography of reports listed in the two OTS monthly abstract journals: U. S. Government Research Reports and Technical Translations. Reports on bearings are arranged in sections as follows: gas lubricated; journal; roller; friction, anti-friction, and ball; bearings, general (includes jewel, sleeve, and thrust bearings).

Manufacturing Equipment and Processes

American Machine and Foundry Co., Chicago, Ill.
STUDY OF THE APPLICATION OF AUTOMATION TECHNIQUES AND EQUIPMENT TO THE MANUFACTURE OF PRECISION LENSES, by J. Des Jardins, H. Ishima and others. Final rept. for Sep 58-Apr 59 on Contract DA 36-034-507-ORD-153. 15 June 59, 155p. MR-1090; AD-220 101.
Order from LC mi$7.50, ph$24.30 PB 146 879

This report summarizes the work completed in a feasibility study to determine how, and to what degree the production methods, processes, and equipment now used in the manufacture of precision lenses (spherical lenses only) for fire control material at Frankford Arsenal Optical Shop can be improved, changed, and supplemented through the application of automation techniques and/or equipment. (Author)

Armour Research Foundation, Chicago, Ill.
BERYLLIUM RESEARCH FOR DEVELOPMENT IN THE AREA OF CASTING, by Frank A. Crossley, Arthur G. Metcalfe, and William H. Graft. Rept. for 15 June 58-14 Oct 59 on Solid State Research and Properties of Matter, Contract AF 33(616)5911. Feb 60, 102p. 33 refs. WADC Technical rept. 59-500....
Order from OTS $2.50 PB 161 754

Various aspects of the casting of beryllium have been investigated: (1) X-ray determination of the direction of columnar growth in cast beryllium; (2) consumable arc melting; (3) reported allotropy by thermal analysis; (4) grain-refining inoculants; and (5) application of vibration to cast beryllium for grain refinement A very pronounced thermal arrest was found 5 to 10°C below the solidification temperature. Also, transformation markings were observed metallographically. No preferred orientation of columnar grains was found. Consumable arc-melting experiments showed grain size from 316 grains/in^2 to 616 grains/in^2. Rust-colored tantalum nitride, WC, and TiB_2 apparently nucleated beryllium solidification to produce grain refinement. Also, an alloying addition of 1 at. % Ge produced grain refinement. (Author)

Office of Technical Services, Dept. of Commerce, Washington, D. C.
WELDING (SUPPLEMENT TO CTR'S 324-331). Mar 60, 14p. 272p. OTS Selective Bibliography 402.
Order from OTS $0.10 OTS SB-402

A bibliography of reports listed in the two OTS monthly abstract journals: U. S. Government Research Reports and Technical Translations. The information is arranged in groupings of PB reports, AEC reports, and translations under sections titled welding techniques, equipment, metals and alloys, and evaluation methods. Government-owned inventions available for license and reviews of foreign monographes comprise other sections.

Transport, Traction and Hoist Facilities

Land Locomotion Lab., Ordnance Tank-Automotive Command, Center Line, Mich.
DRAG COEFFICIENTS OF LOCOMOTION OVER VISCOUS SOILS, PART II, by R. S. Rowe (Duke U.) and Ervin Hegedus. July 59, 32p. 4 refs. Rept. no. 54.
Order from LC mi$3.00, ph$6.30 PB 146 774

A supersaturated viscous mud overlaying a hard bottom material is often critical to locomotion in many areas. To solve the problem of a wheel or track, the familiar concepts of hydro-dynamics pertaining to incompressible viscous fluids may be applied. A correlation between theory and experiment is indicated. The basic problem to be solved is one of viscous flow around a partially submerged object. The variation in pressure resulting from the friction drag causes a bulldozing effect in front of the wheel, and a resulting wake at the back part of the wheel. The pressure drag may be reduced by streamlining the wheel which reduces both the amplitude of the pressure wave and the width of the wake behind the wheel. A comparison between various wheel forms has been made and presented in chart form. A study of the correlation between the boundary layer theory and wheels in viscous fluids is suggested. Contrary to accepted practice the usual boundary layer theory seems to apply to a viscous fluid flowing around a partially submerged object when a turbulent wake is formed. It is further suggested that a series of tests be made with muds of various viscosities and wheel forms to correlate the boundary layer thickness and the pressure distribution in the flow field surrounding the wheel as well as an attempt to solve the Navier-Stokes equations. (Author) (See also PB 134 553)

Midwest Applied Science Corp., Lafayette, Ind.
ON THE BEHAVIOR OF A LINEAR TWO DEGREE OF FREEDOM VEHICLE MOVING WITH CONSTANT VELOCITY ON A TRACK WHOSE CONTOUR IS A STATIONARY RANDOM PROCESS, by J. L. Bogdanoff and Frank Kozin. Rept. no. 2 on Contract DA[33-008]-ORD-1738. July 59, 30p. Rept. no. 59-8; Land Locomotion Lab. Rept. no. 56.
Order from LC mi$2.70, ph$4.80 PB 147 003

This study on the behavior of a linear two degree of freedom vehicle is an extension of the one degree of freedom analysis obtained in Land Locomotion Laboratory Report No. 48 (PB 144 233). Equations 3 & 4 are the general equations of motion for the vehicle. These are simplified in equations 5 & 6 for a symmetrical vehicle. Expressions 13 represent the four relations that must be identical for a model to properly simulate the motion of a prototype. Equations 20 & 21 are the steady state solutions of the vehicle equations of motion for a given random imput. Equations 34 & 35 indicate what time must pass before the steady state solution has reasonable accuracy. (Author)

Rome Air Development Center, Griffiss AFB, N. Y.
SPECIAL-PURPOSE VEHICLES: DESIGN FOR MOBILE SYSTEMS, by George Schmidt. Apr 60, 38p. 1 ref. RADC-TR-60-60.
Order from LC mi$3.00, ph$6.30 PB 147 524

The design of special-purpose vehicles employed in mobile systems for military ground-support applications is discussed. Design factors are listed and the more important of these are discussed in detail. Two mobile systems typifying different design concepts are described in order to illustrate specific design problems and to compare World War II approaches with current approaches used to solve these problems. (Author)

THE EFFECTS OF NUCLEAR RADIATION UPON PHOTOGRAPHIC FILM, by James S. Moser. Preliminary rept. Jan 53, 9p. 2 refs. Technical note WCLF-53-1.
Order from LC mi$1.80, ph$1.80 PB 147 581

This Laboratory has had for some time the problem of determining the protection required for photographic film in a field of nuclear radiation. This report is a summary of the problem and of the work that has been done.

Aeronautical Chart and Information Center, St. Louis, Mo.
MEASUREMENT OF INK AND PRINTING QUALITIES, by Otto C. Stoessel, Jr. Mar 60, 26p. Technical rept. no. 90.
Order from OTS $0.75 PB 161 664

A means is presented here to list and measure various qualities necessary to implement statistical quality control relative to lithographic printing. This includes consideration of printing qualities from the viewpoint of the purchaser of printed matter who has the responsibility of quality standards and from the viewpoint of the lithographic printer who must establish and maintain qualities in consideration of the requirements given him. It further takes into consideration two basic categories; measurement of base material, i.e., paper, ink, and measurement of printed material, i.e., human, mechanical, and general process of applying the raw material. Special attention is given to establishing standards and measurements which are common to both the purchaser and printer. (Author)

Illinois Inst. of Tech., Chicago.
AN INVESTIGATION ON THE DYNAMIC PROPERTIES OF PLASTICS AND RUBBER-LIKE MATERIALS, by R. A. Eubanks, D. Muster, and E. G. Volterra. Technical rept. no. 1 on Contract N7onr-32911. 14 June 52, 125p. 20 refs. AD-307.
Order from LC mi$6.30, ph$19.80 PB 147 013

Analysis of the results of dynamic tests on a natural rubber of 27 to 30 durometer hardness indicated that the phenomena were essentially viscous and that the rubber displayed only slight hereditary effects. Formulas for the rubber specimens tested and a summary of their physical properties are given in an appendix.

Industrial Test Lab., Philadelphia Naval Shipyard, Pa.
DEVELOPMENT OF IMPROVED MATERIALS AND DESIGN FOR BERTH BOTTOMS (BIAS-CUT CANVAS) by H. A. Kline and E. H. Wadlinger. Dec 56, 32p. 9 refs. Development rept. no. 2268; AD-117 448.
Order from LC mi$3.00, ph$6.30 PB 146 504

Berth bottoms made of bias-cut cotton canvas for pipe-frame berths abroad Navy vessels have been found much sturdier and more durable in simulated service tests than the berth bottoms of No. 4 medium texture canvas now specified in Military Specification MIL-B-3715A. Breakdown of the bias bottoms required hundreds of impacts sufficiently violent to cause failure of No. 4 canvas bottoms on first impact. A proposed specification for a bias canvas berth bottom is included in the report. (Authors)

Inland Testing Labs. [Morton Grove, Ill.]
UNIFORM DUPLICATION OF ENVIRONMENTAL TEST RESULTS. PART III. EVALUATION TEST PROGRAM, by Paul Gottfried, Chester G. Polak, and John McGee. Final rept. on Contract AF 33(616)5413. Nov 58, 92. WADC Technical rept. 58-613, Pt. III; AD-205 772.
Order from LC mi$5.40, ph$15.30 PB 146 954

The results of the evaluation test program were analyzed to determine the validity and applicability of the proposed environmental test procedures to accomplish the objective of the contract, which specifically was to develop uniformity and repeatability of the environment test conditions for the assurance of uniform test results regardless of where or when the tests are performed. From the analysis of the test results, it was determined that the repeatability of the environmental test conditions could be improved by: (1) control of the test parameters and associated tolerances, and (2) clarification of the test procedures to assure uniformity in the testing process, as incorporated in the proposed specification revisions detailed in the Part II report. (See also PB 146 573)

Adhesives and Sealants

Borden Chemical Co., Philadelphia, Pa.
DEVELOPMENT OF A DURABLE ASSEMBLY GLUE FOR WOOD FURNITURE, by G. Kitazawa, M. Peters and others. Final rept. for 3 Apr 57-15 Oct 58 on Contract DA 19-129-qm-902. [1958] 44p. AD-219 385.
Order from LC mi$3.30, ph$7.80 PB 146 896

A laboratory study was conducted in the development of a durable furniture assembly adhesive. The general objectives of the development were that the adhesive be as resistant to moisture changes as the durable resin adhesives and have the application and quick set properties of animal glues. The requirements of a durable assembly adhesive have been partly met. The durability to moisture of the prepared adhesive is better than animal glue. However, the speed-of-set or curing rate is below that of the present non-durable assembly adhesives but probably satisfactory for many assembly applications. Further, it was not possible within the contract period to reduce the consistency to the desired level and to eliminate stringiness. The developed adhesive consists of a tackifier for quick set, a slow curing resinous adhesive for durability, and a separately packaged catalyst. (Author)

Feltman [Research and Engineering] Labs., Picatinny Arsenal, Dover, N. J.
IMPACT STRENGTH OF ADHESIVES AS AFFECTED BY GEOMETRY OF JOINT, by Salvatore Stivala. Feb 58, 8p. Technical notes no. 18; AD-157 635.
Order from LC mi$1.80, ph$1.80 PB 147 133

An investigation was conducted to discover what effect, if any, the shape of an adhesive joint has on its impact resistance. Two distinct phases were studied: (1) geometrically different joints having the same bonding areas, and (2) geometrically similar joints having different bonding areas. The geometrical shapes of the cold-rolled steel specimens included circular, semicircular, square, and rectangular configurations. The impact tests were conducted at 73.5°F and 50% relative humidity in accordance with Spec. MMM-A-175. The adhesive used was prepared from 100 parts Epon 828 mixed with 10 parts diethylene triamine. Curing was conducted at room temperature for 24 hr followed by 4 hr at 85°C. Results showed that circular adhesive joints tend to be more resistant to impact than semicircular adhesive joints of the same bonded area. Rectangular adhesive joints of the same area which were arranged differently showed identical impact resistance. Rectangular adhesive joints of increased bonded area showed a tendency to have increased impact strength, calculated in terms of energy required to rupture per unit bond area.

Material Lab., New York Naval Shipyard, Brooklyn.
REPORT OF INVESTIGATION TO DETERMINE THE LIMITING CONDITIONS OF TEMPERATURE AND HUMIDITY FOR APPLICATION OF "COLD BOND" SHAFT COVERING MATERIALS. Final rept. 13 Mar 58, 12p. 7 refs. Lab. Project 5745-1; AD-205 699.
Order from LC mi$2.40, ph$3.30 PB 147 370

An investigation was made to determine the limiting atmospheric conditions (temperature and relative humidity) under which a "cold bond" shaft covering may be applied. These conditions were determined on the basis of conformity of the covering with the adhesion requirements of Specification MIL-S-15058D. Conformity of adhesion with the specification requirements was obtained at 44°F and 78% relative humidity only when the substrate was heated prior to and during coating application. At 74°F adhesion was satisfactory only when the sheet material was solvent cleaned and scrubbed with a wire brush. (Author)

Bell Aircraft Corp., Buffalo, N. Y.
MECHANICAL PROPERTIES OF SELECTED ALLOYS AT ELEVATED TEMPERATURES. PART II. DESIGN CRITERIA OF SILICON CARBIDE, by Harry A. Pearl, John M. Nowak, and Harry G. Deban. Rept. for July 58-Sep 59 on Materials Application, Contract AF 33(616)5760. Mar 60, 134p. 38 refs. WADC Technical rept. 59-702, Pt. 2.
Order from OTS $2.75 PB 161 723

A study was made of nondestructively testing silicon carbide by density uniformity, dynamic modulus by sonic technique, X-ray diffraction under transverse load, electrical resistivity, and internal friction. Dynamic modulus of silicon carbide was experimentally determined at 80 F and 2200 F. Modulus of rupture tests were conducted at 80 F, 2200 F and 2400 F. The variability of the properties of the silicon carbide and the lack of simple correlations between the properties and geometry require the use of a statistical approach to correlate mechanical properties and geometry. A theoretical analysis is presented on the effect of specimen size, surface finish, and methods of loading on the strength properties of silicon carbide. Available literature and manufacturer's property data for various types and forms of commercially available silicon carbide are tabulated. Various areas of possible application of silicon carbide in aircraft and missiles and design parameters for leading edge applications are given. (Author)

REFRACTORY INORGANIC MATERIALS FOR STRUCTURAL APPLICATIONS, by Harry A. Pearl, John M. Nowak, and others. Rept. for June 58-June 59 on Ceramic and Cermet Materials, Contract AF 33(616)5930. Feb 60, 151p. 24 refs. WADC Technical rept. 59-432.
Order from OTS $2.75 PB 161 737

Thirty-five refractory inorganic material systems were evaluated in exploring possible techniques to prepare refractory inorganic materials into high temperature aircraft structural elements. The fabrication techniques were evaluated by the results of room temperature modulus of rupture, impact and thermal shock tests. The best over-all Bell Aircraft system was based on .003" alumina-silica paper impregnated with alumina-silica cement. Specimens of this system were tested at elevated temperature (2000 F) for modulus of rupture, compressive strength and compressive shear. A state of the art survey on foamed ceramics was also conducted as part of this study. (Author)

DUCTILE CERAMICS, by E. R. Parker, J. A. Pask and L. Himmel. Final rept. on Contract AF 49(638)56. Feb 60, 8p. 7 refs. Series no. 109, issue no. 3; AFOSR-TR-60-26.
Order from LC mi$1.80, ph$1.80 PB 146 841

A brief summary of research work accomplished and reports prepared on the ductility of some ceramic single crystalline materials.

Naval Research Lab., Washington, D. C.
EFFECT OF RADIATION UPON CERAMIC-BONDED STRAIN GAGES, by N. J. Rendler and R. C. Smith. Interim rept. 20 Apr 60, 18p. 1 ref. NRL rept. 5450.
Order from OTS $0.50 PB 161 307

The study of the effect of nuclear radiation upon ceramic-bonded strain gages indicates that strain gages must be radiation compensated in a manner analogous to temperature compensation. Electrical resistance of gage elements varies with reactor power, exhibiting both a partial recovery and a permanent damage effect. The radiation-resistance characteristic of gages can be matched, thus extending the promise that with proper compensation the gages will operate satisfactorily as transducers in a nuclear environment. Instrumentation should include provision for a dry, noncorrosive atmosphere and monitoring of insulation resistance. (Author)

Stanford Research Inst., Menlo Park, Calif.
SYNTHESIS OF NEW HIGH TEMPERATURE MATERIALS, by J. L. Engelke, F. A. Halden, and E. P. Farley. Rept. for June 58-June 59 on Ceramic and Cermet Materials, Contract AF 33(616)5888. Feb 60, 44p. 24 refs. WADC Technical rept. 59-654.
Order from OTS $1.25 PB 161 720

A number of mixed transition metal carbides, borides, and nitrides were prepared and examined in terms of melting point, structure, and oxidation resistance. None of the measured melting points was higher than the value reported for HfC-4TaC (3940°C). The melting point for a series of solid solutions between HfC and HbC increased regularly with hafnium content. A material with the composition Mo_2 BC, when heated in an air stream, was found to lose weight rapidly without loss of metallic character, suggesting its possible use as an ablation material. A cubic modification of hafnia was obtained in material sprayed from a plasma arc. A low coefficient of thermal expansion and high melting temperature makes this a material of interest. An implosive-shock technique for compound synthesis, which subjects materials to extremely high temperature-pressure conditions for short periods of time, was developed. The method was used successfully to synthesize boron phosphide. (Author)

COMBUSTION OF SPRAYS IN AN OXIDIZING ATMOSPHERE, by Gregorio Millan, Segismundo Sanz, and Ignacio Da Riva. Rept. on International Congress on Combustion Engines no. 5, 1959, Contract AF 61(514)734C. [1959] 38p. 24 refs. AFOSR-TN-59-818; AD-225 647.
Order from LC mi$3.00, ph$6.30 PB 147 142

The mathematic representation of the statistical size distribution of droplets injected into the combustion chamber of Diesel engine and a gas turbine, is discussed. After consideration is given to some of the distributions proposed by other Technical Sciences (Meteorology - Gravimetrology, etc), the Mugele Evans [Ind. Eng. Chem. 43:1317-1324, 1951] distribution is selected as the most adequate for the problem. The combustion of a spray under ideal conditions is analyzed. It is assumed for it that each droplet burns in accordance with a theoretical law whose validity has been experimentally verified for a few simple cases--isolated droplets at rest or in motion, set of droplets in motion whose relative positions remain invariable, etc. The particular cases considered are the following: combustion at the beginning and end of the injection. Combustion at an instant sufficiently far in time from both the above cases. Combustion of a volume injected instantaneously as approximately occurs in a Diesel engine and, finally, superposition of isolated successive injections. The scaling of atomizers and combustion chambers is analyzed. (Author)

A PRESSURE BOMB FOR THE PHOTOGRAPHY OF BURNING STRANDS OF SOLID PROPELLANT, by David R. Margetts and Benjamin V. Connor. Rept. on Contract DA 04-495-ORD-18. 25 July 58, 25p. 8 refs. Rept. no. 20-119; AD-205 357.
Order from LC mi$2.70, ph$4.80 PB 147 390

A pressure bomb and associated control circuitry has been constructed for the photography of burning strands of solid propellant. The system enables high-speed black and white and color photographs of strands, ranging from 0.15 to 0.35 in. in diameter, to be take at pressures from atmospheric to 2000 psi. Different propellants were photographed. The bomb system and techniques described are capable of yielding useful data on burning surface detail, flame structure, and propellant burning instability over a wide range of propellant luminosity and burning rates.

Naval Propellant Plant, Indian Head, Md.
TALIANI TESTS FOR ASSESSMENT OF STABILITY OF SOLID PROPELLANTS, by Carl Boyars, Kermit Atlas and others. 20 Nov 58, 31p. 8 refs. Technical rept. no. 106; NAVORD rept. no. 5688.
Order from LC mi$3.00, ph$6.30 PB 138 271

The nitrogen Taliani test provides a method for determining the gassing rate of a propellant at a particular temperature and yields information about the nature of the decomposition taking place within the propellant when diffusion of atmospheric oxygen into the propellant is not significant. The oxygen Taliani test, however, can be used for estimating the residual safe storage life of propellants based on nitrate esters, and also for indicating the relative affinity of stabilizers for nitrogen dioxide and the efficiency of antioxidants in composite systems. Both manual- and automatic-recording apparatuses, as modified at the Naval Propellant Plant, are described in detail. (Author)

CORRELATION OF A CLR TEST PROCEDURE WITH THE CRC FL-2 TEST TECHNIQUE, PRELIMINARY STUDIES FOR, by John V. Moffitt. Preliminary studies on Contract DA 23-072-ORD-1144. June 58, 78p. 1 ref.
Order from LC mi$4.50, ph$12.30 PB 138 267

A cursory study was made to investigate use of the CLR engine for low-duty tests comparable to FL-2 and EX-3 procedures. A Chevrolet engine was used to provide data for comparison with CLR results. The CLR engine produced heavier sludge deposits under EX-3 cyclic conditions than under constant FL-2 conditions. CLR correlation with the Chevrolet EX-3 technique was also better. On the other hand, the relatively large thermal inertia of the CLR engine caused prolonged temperature stabilization periods during cycle changes, thus making the EX-3 technique less attractive from an operational standpoint. It is tentatively concluded that either type of technique could be developed for the CLR engine. (Author)

Princeton U., N. J.
FURTHER STUDIES ON THE LIGHT SCATTERING TECHNIQUE FOR DETERMINATION OF SIZE DISTRIBUTIONS IN BURNING SPRAYS. II. WIDE RANGE PHOTOGRAPHIC PHOTOMETRY, by R. A. Dobbins. Technical rept. on Contract AF 18(600)1527. 10 Feb 60, 55p. 15 refs. Aeronautical Engineering Lab. rept. no. 498; AFOSR-TN-60-353.
Order from LC mi$3.60, ph$9.30 PB 146 902

The quantitative measurement by photographic photometry of the angular variation of luminous intensity due to a group of suitably illuminated particles is discussed. Methods of developing a photosensitive film to a high degree of uniformity are shown to depend upon the effectiveness of the mixing of the developing solution and the disruption of the formation of a concentration boundary layer. By careful selection of developing technique and by use of film and microphotometer calibration procedures based on a primary standard of measurement, it was found possible to extend the useful range of a film for photometric purposes to a density of over 2.5. These methods permit the use of photographic photometry to make measurements of irradiance varying over a wide range with good accuracy. Preliminary results indicate that a range of over 100 to one can be achieved with an accuracy of better than 10% over the entire range. Photographic instrumentation applied to the measurement of a diffraction pattern yielded results which were at least as good as electronic photometry with a photomultiplier as a transducer. Cook Research Labs., Morton Grove, Ill.
ANALYSIS OF WEBBING IMPACT DATA AND DETERMINATION OF OPTIMUM INSTRUMENTATION TO BE USED IN CONJUNCTION WITH THE IMPACTING OF WEBBING, by R. B. Williams and R. J. Benjamin. Rept. for May-Sep 59 on Air Force Textile Materials, Contract AF 33(616)6440. Mar 60, 71p. 5 refs. WADC Technical rept. 59-694.
Order from OTS $2.00 PB 161 756

The basic aims of this investigation are: (1) to evaluate and analyze the methods used to obtain data acquired during nylon webbing impact tests conducted at Edwards Air Force Base, California; (2) to interpret these data and to judge their reliability; and (3) to recommend, if necessary, improved or modified testing methods and instrumentation techniques which would result in obtaining data of greater value in future tests. Analysis and interpretation of the test data indicated that these data were of intermediate reliability. Certain trends were apparent, but relatively large experimental scatter existed. Possible causes of the scatter were investigated and recommendations were made for improvement of testing methods, equipment, data reduction technique, and data interpretation. (Author)

Manchester Coll. of Science and Technology (Gt. Brit.)
TENSILE PROPERTIES OF TWISTED SINGLE FIBRES, by R. W. Dent and J. W. S. Hearle. Final technical rept. for Oct 58-Oct 59 on Contract DA 19-591-EUC-931. 30 Oct 59, 146p. 55 refs. AD-233 181.
Order from LC mi$7.20, ph$22.80 PB 146 833

It has been shown that increasing the twist in single fibres or monofilaments causes the tenacity at break and the breaking extension to decrease more rapidly at higher twists, and this decrease appears to be similar for all fibres. Two types of twisting have been used: at constant tension, and at constant length. A connection between the two is suggested. The parameters of pure torsional rupture have been considered and compared with the values obtained by Koch [Textil-Rundschau 3:111; 6:199 and 281]. The effect of the various arbitrary experimental constants has been investigated and related to the work of Breuer and others [Kunstseide u. Zellwolle 202 and 242, 1939]. Snarling in constant tension twisting has been considered. A mathematical treatment of the results is given and a criterion for the fracture of a single fibre or monofilament under combined stresses is suggested. Photomicrographs of the fibres under various combinations of stress are included. (Author)

Textile Research Inst., Princeton, N. J.
LOAD-DEFORMATION BEHAVIOR OF ELASTIC FILAMENTS WITH ARBITRARY INITIAL CONFIGURATION, by Ricardo Chicurel. Technical rept. no. 19 on Contracts Nonr-(09000, 09001). June 59, 154p. 30 refs.
Order from LC mi$7.50, ph$24.30 PB 146 509

The relation between load and deformation for an elastic filament whose axis is an arbitrary curve is examined. The type of loading which is emphasized consists of forces and moments at the ends but some cases of distributed loadings along the length of the filament are also considered. The analysis is divided in two parts: The first discusses filaments whose axes lie in one plane. The effects of bending and direct tension are included but that of shear is ignored. The second part of the analysis concerns itself with filaments whose axes are curves in space. Only bending and twisting effects are considered. (Author)

Textile Research Inst., Princeton, N. J.
THERMAL CHARACTERISTICS OF COATED TEXTILE FABRICS, by Irvin M. Gottlieb, John C. Whitwell and others. Summary rept. no. 2 for 23 Apr 57-30 June 58 on Contract N140(132)57442B. 1 July 58, 129p. 13 refs.
Order from LC mi$6.30, ph$19.80 PB 137 782

Prototype coated fabric systems were prepared in the laboratory in order to study the interactions at high temperatures of three fabrics (cotton, nylon and Orlon) and of three elastomer coatings (butyl rubber, Hypalon and neoprene). In a statistical program of testing and analysis, loss in weight, flammability,

melting and differential thermal data were obtained so as to determine those factors which contributed significantly to the high temperature fabric-coating interactions. The magnitudes of the effects of temperature, coating and fabric type, and method of application on the thermal stability of the coated fabric systems were quantitatively estimated. Significant differences were found in the thermal response, melting and flammability characteristics of the three fabrics and of the three coatings. Marked departures were noted in the thermal behavior of the coated fabric systems from that predicted from the behavior of their components. The high temperature characteristics of eighteen natural, synthetic, regenerated, and derivative fiber types of different chemical composition, and of blends of these fibers with cotton were determined. A broad spectrum of flammability and thermal stability values was obtained. The thermal behavior of the blends (measured by loss in weight), their flammability (measured by minimum temperature for ignition), and their melting characteristics differed from those anticipated from the behavior of their components. The formation of a bead due to the melting of the synthetic fibers was eliminated in the blends with cotton. (Author)

STUDIES OF ORGANIC COATINGS EXPOSED TO GAMMA RADIATION, by Jack Ohr. Partial rept. on Proj. TED NAM AE 42204. 2 July 59, 18p. 4 refs. Rept. no. NAMC-AML-AE 1089; AD-225 022.
Order from LC mi$2.40, ph$3.30 PB 147 218

Twenty experimental and specification aircraft coating systems were exposed to 1.2 mev gamma radiation. Periodic examinations were made for changes in color and film properties. Many coating systems show significant degradation changes in color and film properties after exposures of only 8.0×10^7 roentgens. The radiation stability of the various coatings is explained in terms of polymer structure and chemical groupings. (Author)

Battelle Memorial Inst., Columbus, Ohio.
CHEMICAL SURFACE TREATMENT OF TITANIUM, by H. A. Pray, P. D. Miller, and Richard A. Jefferys. Final rept. on Contract DA 33-019-ORD-215. 30 Oct 53, 33p. WAL 401/45-33.
Order from LC mi$3.00, ph$6.30 PB 147 158

Development of two types of baths that produce adherent, continuous coatings on titanium and its alloys; a 5 per cent sodium hydroxide anodic bath and the fluoride-phosphate and the fluoride-borate immersion baths. The coatings minimize greatly the severe galling tendency of titanium. Certain treatments produced coatings that provided good service for various types of reciprocating and rotary wear. These treatments involved coating the titanium in an immersion bath to produce an adherent, continuous crystalline coating, followed by (1) a heat treatment in air at about 800 F for 3 hours or by (2) application of a MoS_2-Epon resin mixture. The wear resistance is comparable to that for carbonized or nitrided surfaces which require high-temperature treatments, resulting in damage to the core properties.

Naval Civil Engineering Lab., Port Hueneme, Calif.
DECK COATING TESTS, by W. R. Nehlsen. 15 Dec 58, 12p. Technical rept. R-020.
Order from LC mi$2.40, ph$3.30 PB 138 265

A coating made with cement powder, boiled linseed oil, and lead naphthenate dryer was proposed as a superior protective coating for deck surfaces. Tests were made using this coating and a similar formula with pumice replacing the cement powder. The effectiveness of the coatings in providing adhesive, nonslip, wear resistant and corrosion resistant qualities was tested; and the standard Navy paint coating was judged to be superior.

A STUDY OF THE KINETICS OF SOLID-PHASE REACTIONS, by D. L. Armstrong. Technical status rept. no. 8, 16 June-15 Sep 58, on Contract AF 18(603)74. 15 Sep 58, 7p. 3 refs. Rept. no. 1282-8 (Quarterly).
Order from LC mi$1.80, ph$1.80 PB 137 819

Rates of linear pyrolysis of ammonium chloride were obtained. In general, the rate data are consistent with the isothermal vacuum-sublimation data of Spingler and Fehl, and fit the rate equation $B = 120 \exp(-13500/RT_s)$ cm/sec. It is apparent that strand loading force is an important parameter in extending the rate data to high gasification rates. Polymethylmethacrylate samples were synthesized in preparation for further investigation of the mechanism of surface decomposition of this polymer. (Author) (See also PB 144 571)

Army Prosthetics Research Lab., Washington, D. C.
POROUS EPOXY LAMINATE EVALUATION. PART VII. EFFECT OF CURING TIME ON LAMINATE PROPERTIES, by James T. Hill and William C. Wiedmann. [1959] 6p. Rept. no. TR-5928; AD-216 382.
Order from LC mi$1.80, ph$1.80 PB 147 026

The impact resistance like bearing and compressive strength is controlled by effective porosity rather than curing conditions over the range tested. As a result of these tests it is concluded that the laminates may be completely cured at a temperature of 70°C or higher after a minimum precure of 60 minutes. The best conditions for curing, taking into affect effect porosity and physical properties, appear to be 70°C for 120 minutes. Longer or higher temperatures tend to cause discoloration of the laminates.

Office of Technical Services, Dept. of Commerce, Washington, D. C.
PLASTICS-POLYMER RESEARCH (FIVE YEAR BIBLIOGRAPHY). Oct 59, 27p. 504 refs. OTS Selective Bibliography 400.
Order from OTS $0.10 OTS SB-400

A bibliography of reports listed in the two OTS monthly abstract journals: U.S. Government Research Reports and Technical Translations. The information is arranged in groupings of PB reports, AEC reports, and translations under the following sections, which are intended as rough guides only: acrylics; cellulosics; fluoroplastics; phenolics; polyesters, polyurethanes, epoxides; polyethylenes; polystyrene; silicon-base; vinyls; adhesives; coatings and impregnants; fibers and textiles; foams, sealants, interlayers; laminates; radiation effects; general and miscellaneous. While synthetic rubber research has not been included, a few reports have been listed; these are either in borderline or overlapping areas or of sufficient pertinence or interest for inclusion. A large number of plastic reports involve several categories and in some instances two or more categories have received almost equal attention. Many polyethylene-base plastics, for example, have been placed under polyethylene. Numerous monomeric studies have been grouped with the nearest polymer.

Springfield Armory, Mass.
INTERACTION OF PLASTICS WITH VOLATILE CORROSION INHIBITORS: THIRD AND FINAL PARTIAL, by R. L. Keleher and A. Hitchins. Partial rept. no. 3 (Final) 12 Apr 57, 20p. SA-TR20-2309; AD-141 810.
Order from LC mi$2.40, ph$3.30 PB 146 992

The interaction of six thermo-plastic materials with four volatile corrosion inhibitor formulations qualified under MIL-P-3420 was observed over a nine-month period. Plastic samples were wrapped with VCI paper, enclosed in heat-sealed MIL-B-131 barrier envelopes, and exposed at 100°F and 95 percent relative humidity. Examinations showed that "CODE NL" and "CODE BH-3" were not affected by any of the four inhibitors. The other plastics tested were adversely affected to varying degrees. Delamination of the vinyl film of the barrier material was caused by two of the VCI's. (Author)

Victory Plastics Co., Hudson, Mass.
INVESTIGATION OF MATERIALS AND METHODS OF OBTAINING SUITABLE SURFACE COATING FOR GLASS FIBER REINFORCED PLASTIC STOCKS. Final summary rept. on Contract DA 19-020-ORD-3794. May 58, 66p. AD-160 047.
Order from LC mi$3.90, ph$10.80 PB 147 021

An investigation was made of materials and methods for obtaining optimum surface properties on glass fiber reinforced plastic stocks. Results of the investigation demonstrated that by the proper application of suitable materials, improvements are realized in low temperature impact properties, abrasion resistance, appearance and gripping qualities. At the same time, satisfactory resistance to weathering, heat at 250°F, water, oils, gasoline, and trichlorethylene was maintained.

HARBOR SCREENING TESTS OF MARINE BORER INHIBITORS, II, by Harry Hochman and Thorndyke Roe, Jr. Interim rept. 16 Mar 60, 33p. 7 refs. Technical rept. 077.
Order from LC mi$3.00, ph$6.30 PB 147 116

This report studies more effective methods and materials for preserving wooden structures exposed to marine boring organisms. It reports the results of treated and untreated test panels which are harbor-exposed to heavy Limnoria attack or to weakening by Martesia or teredine attack. (Author) (See also PB 143 053)

Naval Radiological Defense Lab., San Francisco, Calif.
THERMAL RADIATION DAMAGE TO CELLULOSIC MATERIALS. PART IV. INFLUENCE OF THE MOISTURE CONTENT AND THE RADIANT ABSORPTIVITY OF CELLULOSIC MATERIALS ON THEIR IGNITION BEHAVIOR, by S. Martin, K. A. Lincoln, and R. W. Ramstad. 30 Dec 58, 28p. 13 refs. Research and Development Technical rept. USNRDL-TR-295; AFSWP-1117; AD-216 545.
Order from LC mi$2.70, ph$4.80 PB 146 845

Measurements of the radiant exposure required for the ignition of alpha-cellulose at controlled levels of humidity and for various radiant absorptances show that the influence of the moisture content and the absorptivity of the material on its ignition behavior can be accounted for by the appropriate modification of the correlation moduli. Data were obtained for dark cellulosic sheet fuel in the relative humidity range 10 to 87 percent and for sheet cellulose having a broad range of absorptance values. The data for all but the white cellulose correlate well to a single ignition behavior pattern. Limited experimentation with white cellulose indicates that for materials in the low range of absorptivity, the absorptance multiplier in the irradiance modulus should be raised to a power less than unity. (See also PB 142 177)

Applied Mathematics and Statistics Lab., Stanford U., Calif.
A MULTIPLICATIVE MODEL FOR ANALYZING VARIANCES WHICH ARE AFFECTED BY SEVERAL FACTORS, by Robert Bechhofer. Technical rept. no. 40 on Contracts N6onr-251(26) and AF 49(638)230. 10 July 59, 43p. 24 refs. AD-220 443.
Order from LC mi$3.30, ph$7.80 PB 147 062

A new way is proposed for looking at multifactor experiments which are conducted to study the effect of changes in the levels of the factors on the variance of a chance variable. A mathematical model is proposed which assumes that the effect of changing a factor from level 1 to level 2 is to multiply the original variance of the chance variable by a positive constant. This is in contrast to a model which assumes that the effect of changing a factor from level 1 to level 2 is to add a constant to the original variance of the chance variable. Thus a multiplicative model allows one to speak of relative (percentage) changes; an additive model allows one to speak of absolute changes. The univariate multiplicative model for variances is introduced and its experimental interpretation in classical terms is given. Factorial experiments, experimental designs, and the concept of an approximating multiplicative response surface for variances are also described. (Author)

Applied Mathematics and Statistics Lab., Stanford U., Calif.
THE OPTIMALITY OF (S, s) POLICIES IN THE DYNAMIC INVENTORY PROBLEM, by Herbert Scarf. Technical rept. no. 11 on Contract Nonr-225(28). 10 Apr 59, 13p. 5 refs.
Order from LC mi$2.40, ph$3.30 PB 146 052

This paper considers the dynamic inventory problem with an ordering cost composed of a unit cost plus a reorder cost. It is shown that if the holding and shortage costs are linear then the optimal policy in each period is always of the (S, s) type. More general conditions on the holding and shortage costs are given which imply the same result. A similar result is also given in the case of a time lag in delivery. (Author)

Applied Mathematics and Statistics Lab., Stanford U., Calif.
SLIPPAGE PROBLEMS, by Samuel Karlin and Donald Truax. Technical Rept. no. 28 on Contract Nonr-225(21). 8 June 59, 62p. 11 refs.
Order from LC mi$3.90, ph$10.80 PB 146 425

Roughly, the problem is as follows: We wish to compare n populations which have density functions $f(x, \theta_1)$, $f(x, \theta_2)$, ..., $f(x, \theta_n)$. On the basis of a sample from each population we want to decide if all the θ_i are equal or if not, which is the largest. Actually a more restricted problem is considered in this paper in which either all parameter values are equal, or all but one are equal and the exceptional one is larger. If the i^{th} one is larger we will say it has slipped to the right.

Applied Mathematics and Statics Lab., Stanford U., Calif.
SUFFICIENT CONDITIONS FOR UNCONSTRAINED OR CONSTRAINED MAXIMIZATION OF A QUASI-CONCAVE FUNCTION by Kenneth Arrow. Technical rept. no. 75 on Contract Nonr-225(50). 30 June 59, 20p. 7 refs. AD-219 877.
Order from LC mi$2.40, ph$3.30 PB 146 427

The sufficiency is investigated for the vector variable x assuming that the function f(x) is quasi-concave, i.e., for each real number c, the set $[x:f(x) \geqq c]$ is concave. Assume that the vector x can be partitioned into vectors x^1, x^2 such that $\bar{f}_{x^1} > 0$, $\bar{f}_{x^2} > 0$, $\bar{x}^2 = 0$. (The bar denotes evaluation at x; x will be a column vector, and f_x a row vector.) The function $f(x^1, 0)$ is shown to be maximum at $\bar{x}^1$ under certain (essentially local) regularity conditions. Theorems are presented which bear on the duality between constrained maxima and minima. From these theorems, a sufficient condition is derived for the maximization of a quasi-concave function. The relation between constrained maxima and the saddle point of the Lagrangian, L(x, y), is also discussed.

Brown U. [Div. of Applied Mathematics] Providence, R. I.
A NOTE ON REVEALED PREFERENCE, by David Gale. Technical rept. no. 4 on Contract Nonr-562(15). 1959, 11p. 2 refs. AD-220 052.
Order from LC mi$2.40, ph$3.30 PB 147 089

An economy is considered in which there are n goods and a single consumer with a fixed income which is assumed to be unity. For each set of unit prices, $p_1, \ldots, p_n$ which is assigned to the n goods it is assumed that the consumer chooses certain quantities $x_1, \ldots, x_n$ of these goods subject to the condition that the total cost of the goods does not exceed his income. The consumer's demand function D is defined as a mapping from non-negative (price) vectors $p = (p_1, \ldots, p_n)$ into non-negative (goods) vectors $x = (x_1, \ldots, x_n) = D(p)$ which satisfies the budget inequality, $pD(p) \leqq 1$, where juxtaposition of vectors stands for scaler product. The demand function D comes from a preference function if there exists a real valued function ϕ defined on non-negative (goods) vectors x such that $D(p) = \max_{px \leqq 1} \phi(x)$. A necessary condition that D come from a preference function is that it satisfy the weak axiom of revealed preference: If p and q are price vectors and $pD(q) \leqq 1$ and $qD(p) \leqq 1$ then $D(p) = D(q)$. An example is given of a demand function which satisfies the weak axiom but does not come from a preference function. (Author)

THE ANALYTIC EMBEDDING OF ABSTRACT REAL-ANALYTIC MANIFOLDS, by Charles B. Morrey, Jr. Technical rept. no. 21 on Contract Nonr-222(37). Jan 58, 67p. 13 refs.
Order from LC mi$3.90, ph$10.80 PB 138 282

H. Whitney (Ann. of Math. 37(1936) 645-680) ν-dimensional manifold of class C^n or C^ω can be mapped onto a real-analytic manifold situated in the real Euclidean space $E_{0,\ 2\nu+1}$ of $2\nu+1$ dimensions by a map of class C^n or C^ω respectively. The question of whether or not an abstract real-analytic compact manifold can be mapped analytically onto such a manifold in $E_{0,\ 2\nu+1}$ was left open. Bochner (Duke Math J. 3(1937)339-354) answered this question in the affirmative in the case where the manifold possesses an analytic Riemannian metric; this result was extended by Malgrange (Boll. Soc. Math. France 85(1957)101-113) to the case of non-compact manifolds. The present paper answers this question in the affirmative for compact manifolds without assuming the existence of an analytic Riemannian metric.

California U., Berkeley.
ASYMPTOTIC STABILITY OF SOLUTIONS OF PARABOLIC EQUATIONS UNDER VARIOUS BOUNDARY CONDITIONS, by Avner Friedman. Technical rept. no. 6 on Contract Nonr-222(62). Apr 59, 66p. 19 refs. AD-219 328.
Order from LC mi$3.90, ph$10.80 PB 146 045

The asympotic stability is established for the second mixed boundary problem $Lu = f(x, t) + K(x, t, u)$, $\partial u/\partial T + g(x, t, u) = h(x, t)$ where $|\partial k/\partial u|$ is small and $\partial g/\partial u$ is positive and tends to a function g(x) as $t \to \infty$. L is the general parabolic operator of the second order, and f is a sum of a linear function g(x, t) and a nonlinear function k(x, t, u) with $|\partial k/\partial u|$ sufficiently small. The second mixed boundary condition is: u is a given function on the base of a domain D, and $\partial u/\partial T = g(x, t, u)$ on the lateral boundary of D, g being monotone decreasing in u and $g(x, t, 1) = 0$. A proof is presented of a theorem on the asymptotic expansion of u and strong results are derived.

A SIMPLIFIED PROCEDURE FOR FINDING LAPLACE TRANSFORMS, by Martin Blumberg. Rept. on Contract DA 36-039-sc-73170. 13 May 58, 18p. 5 refs. Technical memo. no. EDL-M141; AD-203 548.
Order from LC mi$2.40, ph$3.30 PB 147 019

A method is given for obtaining quickly the Laplace transform of certain functions. The procedure utilizes successive differentiations until delta functions are reached as a result of differentiation at a discontinuity. The Laplace transform of the original function is then found from the Laplace transform of the delta functions. The method is particularly easy to apply to functions possessing a finite number of non-zero derivatives; it is also applicable to functions possessing an infinite number of non-zero derivatives. Several examples are given. The relation between the Laplace transform and the exponential form of the Fourier Series is also indicated. (Author)

AN ITERATIVE PROCEDURE FOR OBTAINING FRACTIONAL ROOTS OF REAL NUMBERS, by Eugene M. Romer. Apr 59, 16p. WADC Technical note 59-116; AD-214 428.
Order from OTS $0.50 PB 161 085

An iterative procedure is derived to obtain any integral root of a number. The method is valid for any initial estimate greater than zero. Since the fractional root of a number can be expressed as the integral root of another number, this method can be used to find fractional roots. Two formulae are obtained, and the criteria for the use of each are established. Since only the use of the square root process is required in addition to the 4 basic arithmetic operations, this procedure is suitable for use on desk calculators and can esily be adapted for digital computer applications. A NONLINEAR TWO-POINT BOUNDARY VALUE PROBLEM, by Milton Lees. Rept. on Contract AF 49(638)253. Jan 60, 15p. 17 refs. AFOSR-TN-60-140; AD-232 948.
Order from LC mi$2.40, ph$3.30 PB 146 090

Existence, uniqueness, and finite-difference approximation theorems are obtained for a 2-point boundary value problem for the differential equation $u'' = f(x,u,u')$. The results require that the function $f(x,z,p)$ be such that $\partial f/\partial p$ is uniformly bounded and that $\partial f/\partial z$ be bounded from below by zero and from above by a continuous function of z alone. POINCARÉ CYCLES AND ERGODIC BEHAVIOUR OF A LINEAR DIATOMIC CHAIN, by Leopoldo S. Garcia-Colin. Rept. on Contract AF 18(600)1315. Apr 60, 28p. 8 refs. Technical note BN-206; AFOSR-TN-60-466.
Order from LC mi$2.70, ph$4.80 PB 147 167

The ergodic behavious of a linear diatomic chain is shown to be analogous to that of a linear monoatomic chain. Starting with the expressions for the time relaxed correlation functions between any two particles in the chain, we show that the existence of Poincaré cycles is not inconsistent with the development of an equilibrium state. Also, we show that those dynamical variables which are ergodic for the linear monoatomic chain remain ergodic in the diatomic chain. It is shown that the auto correlation functions for particles with equal or different masses decay in time as $t^{-1/2}$. (Author)

SMALL SAMPLE DISTRIBUTIONS FOR MULTI-SAMPLE STATISTICS OF THE SMIRNOV TYPE, by Z. W. Birnbaum and R. A. Hall. Technical rept. no. 33 on Contract Nonr-477(11). 1 July 59, 20p. 6 refs. AD-219 994.
Order from LC mi$2.40, ph$3.30 PB 147 075

Consider c samples of sizes n_i, $i = 1, 2, \ldots, c$, from c independent univariate random variables X^i with continuous cumulative distribution functions F^i. Under the null hypothesis, $F^i = F^j$ for all $i, j = 1, 2, \ldots, c$, the exact small sample distribution of the statistics defined by $D(n_1, n_2, \ldots, n_c) = \sup_{x,i,j} |F^{*i}(x) - F^{*j}(x)|$, and $D^+(n_1, n_2, \ldots, n_c) = \sup_{x,i,j} [F^{*i}(x) - F^{*j}(x)]$, $i < j$ for any number c of samples and for any sample sizes $n_1, n_2, \ldots, n_c$ is obtained by solving simple difference equations. Using this procedure, tables are computed for values of $P[D(n,n,n) \leq r]$, $P[D(n,n) \leq r]$, and $P[D^+(n,n) \leq r]$ for selected values of n between 1 and 40, and of $r = k/n$, $k \leq n$.

THE USE OF INTEGRAL TRANSFORMS FOR OBTAINING SERIES EXPANSIONS IN TERMS OF CERTAIN HIGHER TRANSCENDENTAL FUNCTIONS, I. FOURIER AND BESSEL TRANSFORMS OF FINITE TYPE, by F. Oberhettinger. Rept. on Contract DA 11-022-ORD-2059. Aug 58, 48p. 19 refs. MRC Technical summary rept. no. 38; AD-203 844.
Order from LC mi$3.30, ph$7.80 PB 147 023

The following investigations are based on the finite Fourier (or Bessel) integral transorm combined with some special Fourier (or Schloemilch) series expansions. The connection between infinite series of a particular type and integral transforms as described above admits the summation of a large number of series expansions involving higher transcendental functions. Many of the results obtained this way and listed here are believed to be new and some of them are generalization of known cases. Part I of this report is based upon the connection between Fourier series and Fourier integral of finite type by means of the interpolating property of the cardinal series. Part II is based upon Poisson's summation formula applied to functions whose Fourier cosine transforms are different from zero within a finite interval. The results in Part III are obtained by a generalization of the procedure used in Part I such that instead of Fourier series and integrals their generalizations i.e. Schloemilch series and Bessel transforms of finite type are used.

A FAMILY OF INTEGRALS SERVING TO CONNECT THE WIENER AND FEYNMAN INTEGRALS, by R. H. Cameron. Technical rept. no. 12 on Contract AF 18(603)30. 23 Nov 59, 27p. 7 refs. AFOSR-TN-59-1272.
Order from LC mi$2.70, ph$4.80 PB 146 440

This paper gives a sequential definition of a family of integrals depending on a "variance parameter" σ^2. If σ^2 is real this reduces under reasonable conditions to the ordinary Wiener integral. If σ^2 is pure imaginary, the integral can be considered as a Feynman integral. For certain analytic functionals, it is shown that the Feynman integral reduces to an ordinary Wiener integral. (Author)

PROPERTIES OF MAXIMUM LIKELIHOOD ESTIMATORS IN NONSTABLE STOCHASTIC DIFFERENCE EQUATIONS, by Malempati Madhusudana Rao. Technical rept. no. 7 on Contract Nonr-2582(00). 31 July 59, 112p. 26 refs. AD-220 126.
Order from LC mi$6.00, ph$18.30 PB 147 087

The asymptotic properties are studied for estimators of parameters in the unstable processes. Processes satisfying a kth order, homogeneous (without constant terms), linear stochastic difference equation are studied in detail. For the general stochastic processes, hypotheses are formulated in terms of restrictions on the derivatives of the likelihood function. The

arbitrary finite order k are then considered. The results deal with a certain (first order least squares) estimator of the maximal (in absolute value) root of the difference equation, and the least squares estimators of the coefficients in the difference equation

ON AUTOMATIC CONTROLS, by S. Lefshetz. Rept. on Contract AF 49(638)382. Mar 60, 12p. Technical rept. 60-9; AFOSR-TN-60-230.
Order from LC mi$2.40, ph$3.30 PB 147 318

The problem of automatic controls has been treated more or less linearly by a number of Soviet authors (Lurye, Letov, Yacubovich). A treatment is presented taking account of the nonlinearity of the regulated system. Certain consequences of this nonlinearity are also made clear.

RIAS, Baltimore, Md.
PIECEWISE CONTINUOUS DIFFERENTIAL EQUATIONS, by J. Andre (Technische Hochschule, Braunschweig) and P. Seibert. Rept. on Contract AF 49(638)382. Mar 60, 13p. 2 refs. Technical rept. 60-6; AFOSR-TN-60-232.
Order from LC mi$2.40, ph$3.30 PB 147 315

A brief survey of the local properties of solutions of systems of piecewise continuous differential equations near the surfaces of discontinuity is given. Some properties of the corresponding systems with retardation [time-lag, switching delay] are discussed with emphasis on the so-called after-endpoint motions. (Author)

RIAS, Baltimore, Md.
ULTIMATE BOUNDEDNESS AND STABILITY UNDER PERTURBATIONS, by P. Seibert. Rept. on Contract AF 49(638)382. Mar 60, 22p. 8 refs. Technical rept. 60-7; AFOSR-TN-60-231; AD-233 733.
Order from LC mi$2.70, ph$4.80 PB 147 316

The first half of the paper concerns the preservation of ultimate boundedness of a dynamical system under perturbations. The results are centered around a general principle, according to which the motions of the unperturbed and of a perturbed system with the same initial point remain within a certain fixed maximal distance from each other for all time, if they do so for a small length of time and if, in addition, the unperturbed system is ultimately bounded. This result is then applied to the problem of preservation of stability under perturbations and a necessary and sufficient condition for the latter is obtained. (Author)

THE USE OF SAMPLE QUASI-RANGES IN SETTING CONFIDENCE INTERVALS FOR THE POPULATION STANDARD DEVIATION, by F. C. Leone, Y. H. Rutenberg, and C. W. Topp. Rept. on Contract AF 49(638)361. Mar 60, 20p. 8 refs. AFOSR-TN-60-408.
Order from LC mi$2.40, ph$3.30 PB 146 872

The problem is the choice of an optimal selection method of quasi-ranges for setting one sided confidence bounds and confidence intervals for the standard deviation from a given distribution. The proposed methods of optimal selection are applied to random ordered sample from the normal, exponential and rectangular distributions. Tables of confidence bounds for the standard deviation of these distributions are given for confidence levels commonly used in statistical work. These are compared with the results of standard procedures. (Author)

PERMUTATION SUPPORT FOR MULTIVARIATE TECHNIQUES, by Harvey J. Arnold. Technical rept. no. 14 on Contract DA 36-034-ORD-2297. [1951] 96p. 17 refs. OOR rept. 1715-....; AD-208 613.
Order from LC mi$5.40, ph$15.30 PB 147 147

The multivariate generalization of the t test is investigated. The first four permutation cumulants are determined for a statistic which is a simple function of the commonly used Hotelling's T^2. In the univariate situation T^2 simply becomes the square of t, and tests based on T^2 are identical with tests based on t. The derived permutation cumulants are applied to data obtained from a sampling experiment. The samples are from bivariate normal and rectangular populations. A discussion of various ways of adjusting the test criterion is included when one suspects that the data does not come from a normal distribution.

RECURRENCE FORMULAE AND TABLES FOR HEMISPHERICAL HARMONICS, by Choong Yung Cho. Rept. on Contract N7onr-285(11). 15 July 59, 42p. 3 refs. Technical rept. WIS-ONR-37; AD-225 590.
Order from LC mi$3.30; ph$7.80 PB 147 085

Recurrence formulas and numerical tables are provided for A^m_{nk} and B^m_{nk}, coefficients of expansion of the associated Legendre polynomials in terms of the hemispherical harmonics.

$$P^m_n(\mu) = \sum_{k=0}^{n-1} A^m_{nk} \sqrt{1-\mu^2}\, \bar{P}_k(\mu) \quad \text{(m: odd)}$$

$$\sum_{k=0}^{n+1} B^m_{nk} \frac{1}{\sqrt{1-\mu^2}} P_k(\mu) \quad \text{(m: odd)}$$

where $2\mu = 1 - x$. (Author)

ROOTS OF INNER AUTOMORPHISMS, by F. Haimo. Rept. on Contract AF 49(638)218. Apr 60, 13p. 2 refs. AFOSR-TN-60-32.
Order from LC mi$2.40, ph$3.30 PB 146 784

M. Auslander has proposed the problem of finding a group with an outer automorphism α with n-th power inner and n^2 - power trivial. Further, he requires that the fixed points of α lie in the center of the group. Starting with any group H, we form $H \oplus (H/H')$, reducing this direct sum by a suitable subgroup. If the reducing subgroup is properly chosen, the quotient group has a normal automorphism with a power which is inner. Examples are more readily obtained if H is of class 2.

Wayne State U., Detroit, Mich.
CONFORMAL MAPS OF ALMOST KAEHLER MANIFOLDS, by S. I. Goldberg. Rept. on Contract AF 49(638)14. Jan 60, 20p. 8 refs. AFOSR-TN-60-95; AD-232 556.
Order from LC mi$2.40, ph$3.30 PB 146 087

Groups of conformal maps of almost Kaehler manifolds are studied. The following theorem is proved: The largest connected Lie group of conformal transformations of a compact almost Kaehler manifold M^{2n} $(n>1)$ coincides with the largest connected group of automorphisms of the almost Kaehler structure. This generalizes a corresponding theorem established by Lichnerowicz for Kaehler Manifolds. By restricting the conformal maps to those whose associated 1-forms are closed, a much wider class of manifolds may be considered. (Author)

PROGRAMMING AN IDEALIZED GENERAL-PURPOSE COMPUTER TO DECIDE QUESTIONS OF TRUTH AND FALSEHOOD, by Irving M. Copi and Robert W. Beard. Rept. on Project Michigan, Contract DA 36-039-sc-52654. Apr 59, 17p. 5 refs. Rept. no. 2144-402-T; AD-214 305.
Order from LC mi$2.40, ph$3.30 PB 146 244

Routines are formulated and explained for the programming of a general-purpose digital computer to decide the validity or invalidity of 3 kinds of logical formulas: formulas of the propositional calculus containing up to 2000 variables, the equality formulas, and formulas of the monadic predicate calculus. Results show that the routines contain improvements over the usual decision procedures from the point of view of computational facility.

NODAC: THE NAVAL ORDNANCE DATA AUTOMATION CENTER, by R. V. Herman, H. V. Hilker, and J. B. Moffett. Jan 60, 22p. NOTS TP-2394; NAVORD rept. 7027.
Order from LC mi$2.70, ph$4.80 PB 147 433

NODAC is a data-reduction machine that, by means of plug-in logic packages and patchboards, can be adapted to any data-reduction problem in a very short time. The machine is designed to take full advantage of the capabilities of the IBM-709 computer. It consists of analog and digital sections interconnected by a converter unit through which conversions can be made in either direction at a current rate of 25,000 samples per second. It is currently in use on Naval Ordnance Test Station data-reduction programs, and, as various units are added to bring its capabilities up to the design standard, it will be able to handle these programs on decreasing time scales. SURVEY OF ANALOG CROSS-SPECTRAL ANALYZERS, by Lester J. Seltzer and Duane T. McRuer. Rept. on Contract AF 33(616)5822. Dec 59, 74p. 28 refs. WADC Technical rept. 59-241.
Order from OTS $2.00 PB 161 704

This report presents a survey of analog devices which have been used to compute cross-spectra in the processing of data from human response experiments. The machines described have been analyzed to show the principles upon which they depend. Where available, the results of calibration experiments have been included as a measure of specific performance. Correlation and spectral measurement are discussed, introductory to consideration of measurement fundamentals for closed loop human response tests. Theoretical ways of calculating cross-spectra are presented and referred to the mechanization of the cross-spectral machines. The effect of nonideal elements on the performance theoretically attainable is considered, together with a discussion of the accuracy of spectral estimates. (Author)

THE GRAPHICAL SOLUTION OF 45-DEGREE STRAIN-ROSETTE DATA AND DETERMINATION OF ERROR IN THE CALCULATED STRESSES DUE TO ERRORS IN MEASURED STRAINS, by Margaret E. Duke and Edward Wenk, Jr. Nov 49, 22p. 20 refs. Rept. 600.
Order from LC mi$2.70, ph$4.80 PB 147 270

The state of stress in a biaxial field can be determined experimentally by measurement of strains along any three gage lines. The reduction of data by orthodox computation is generally so laborious, however, that various mechanical and graphical systems have been devised to simplify solutions. A number of these methods are described and discussed in this report. The graphical system found to be most satisfactory is reproduced in chart form for use in determining, from 45-degree strain-gage rosettes, principal stresses, maximum shear stresses, and orientation of principal axes.

Institute for Fluid Dynamics and Applied Mathematics, U. of Maryland, College Park.
EXPERIMENTAL INVESTIGATIONS OF THE INTERACTION BETWEEN A SHOCK AND A MAGNETIC FIELD, by John Paul Barach. Rept. on Contract AF 49(638)401. Mar 60, 31p. 12 refs. Technical note 8N-203; AFOSR-TN-60-439.
Order from LC mi$3.00, ph$6.30 PB 147 005

A magnetic interaction has been observed with flows of Mach number about 15 in krypton and inhomogeneous magnetic field of about 50,000 gauss. The loss of momentum flux in the gas flow is proportional to the magnetic impulse taken up to a point, where there seems to be a sudden adjustment of flow velocity. The position of this point is determined by the parameter $\sigma v B^2/P$. The higher this parameter, the earlier the interaction and the less its total effect. Moderately low values of the parameter produce the largest effects. (Author)

FRICTION AND WEAR AT ELEVATED TEMPERATURES, by Ernest Rabinowicz. Rept. on The Structure and Properties of Interfaces, Contract AF 33(616)5963. Jan 60, 25p. 11 refs. WADC Technical rept. 59-603.
Order from OTS $0.75 PB 161 719

A new high-temperature friction apparatus has been constructed which allows sliding experiments to be carried out at temperatures to 2000 F. in controlled atmospheres, and at speeds varying over a wide range. Tests have been run on this machine and on an older machine. These and other results are discussed theoretically in terms of the surface energy --- hardness ratio and of the wear coefficient. From the experimental results, it appears that the main influence of temperature on the friction and wear results is through changes of hardness, of surface energy, and of tensile strength. (Author)

Minnesota U., Minneapolis.
ON THE UTILIZATION OF THE CONCEPT OF BOUNDARY IMPEDANCE IN VIBRATIONS OF BARS, by F. J. Wilmers and R. F. Lambert. Rept. for 5 Sep 58-15 June 59 on Materials Analysis and Evaluation Techniques, Contract AF 33(616)5426. Feb 60, 44p. 11 refs. WADC Technical rept. 59-545.
Order from OTS $1.25 PB 161 740

This report deals with the utilization of boundary impedance in describing conditions at the extreme boundaries of a bar and its measurement by employing techniques derived from electrical transmission line theory. Important similarities and differences between a mechanical and electrical transmission lines are discussed. The concepts are applied to the measurement of a reactive termination and to the development of a "complex conjugate" matching section. These concepts also present a convenient specification of boundary conditions in applications involving random vibrations and fatigue. (Author)

STEADY STATE DAMPED VIBRATIONS AND STABILITY OF A CLASS OF NONLINEAR DISCRETE SYSTEMS, by S. T. Chow and P. R. Sethna. Rept. for Oct 58-July 59 on Materials Analysis and Evaluation Techniques, Contract AF 33(616)5426. Mar 60, 52p. 7 refs. WADC Technical rept. 59-543.
Order from OTS $1.50 PB 161 748

A class of nonlinear discrete systems with an arbitrary number of degrees of freedom are studied for their steady state vibrations. The coordinates are first transformed to the principal coordinates corresponding

to the linear part of the system. An iteration scheme is used to obtain the desired solutions. Some special effects of the relations between the linear natural frequencies on the qualitative nature of the solutions are demonstrated. It is shown that if the linear natural frequencies do not possess certain relations, the system can be treated in a manner similar to that for a system of a single degree of freedom. In other cases the procedure gets more complicated. The various solutions are then examined for their stability. Poincare's theory of singularities in the phase plane is used to study the stability of those problems that can be treated in a manner similar to that for a single degree of freedom system. In all other cases the stability is examined by applying the Routh-Hurwitz criterion to a transformed set of equations. Solution for one specific problem is obtained and checked against those obtained from an analog type computer. (Author)

Aeronautical Research Lab., Wright Air Development [Division] Wright-Patterson AFB, Ohio.
AN EXPERIMENTAL STUDY OF VORTEX CHAMBER FLOW, by Jack P. Holman and George D. Moore. Oct 59, 35p. 8 refs. WADC Technical note 59-388.
Order from OTS $1.00 PB 161 700

It is shown that a relatively simple analysis predicts the functional variation of temperature and pressure in a vortex chamber with radius and inlet velocity. The predicted variation is in good agreement with experimental observations. By assuming that the flow at the outside of the chamber occupies some effective flow area, which is essentially independent of flow rate, the inlet velocity may be expressed in terms of the chamber dimensions and the fluid properties at entrance. The effective flow area assumption is verified experimentally for two chamber exit configurations using air. It was found that the velocity in a five-inch diameter chamber, four inches long, could be represented by the expression

$$Vr^{n} = \text{Const.}$$

with $n = 0.68$. The pressure and temperature were related through

$$Tp^{\frac{1-n_1}{n_1}} = \text{Const.}$$

with $n = 1.28$. It is shown that, given either n or n_1, one may calculate the other with a simple relationship. (Author)

ON THE USE OF QUATERNIONS IN SIMULATION OF RIGID-BODY MOTION, by Alfred C. Robinson. Rept. on Flight Dynamics Research and Analysis Facility. Dec 58, 97p. 7 refs. WADC Technical rept. 58-17.
Order from OTS $2.25 PB 161 732

The theory of the four-parameter method is developed with specific application to coordinate conversion in aircraft simulations. This method is compared with the direction cosine method both in a theoretical error analysis and in an example simulation on an analog computer. It is shown that the quaternion method is no more sensitive to multiplier errors than is the direction cosine method, and it requires nearly 30 per cent less computing equipment. In addition, the multiplier bandpass requirement in the four-parameter method is only half as severe as for direction cosines. By every important criterion, the quaternion method is no worse than, and in most cases, better than the direction cosine method. (Author)

AERODYNAMIC HEATING FACILITIES, by J. Leith Potter. Rept. on ARO, Inc., Contract AF 40(600)-700 S/A 13(59-1). July 58, 17p. 10 refs. AEDC-TR-58-7; AD-161 033.
Order from LC mi$2.40, ph$3.30 PB 147 145

This is a discussion of ground test facilities providing simulation, to some degree, of the aerodynamic heating and loading encountered by aircraft or spacecraft operating within the earth's atmosphere. The ranges of speed, stagnation conditions and their time derivatives corresponding to typical missile trajectories are used to demonstrate the problem of flight simulation. Means for achieving partial simulation in laboratories are described, with consideration given to the advantages and disadvantages of most of the methods currently used or being studied. (Author)

Arnold Engineering Development Center [Tullahoma Tenn.]
DETERMINATION OF OPTIMUM OPERATING PARAMETERS FOR THE 1-FOOT TRANSONIC TUNNEL UTILIZING CONE-CYLINDER BODIES OF REVOLUTION, by William L. Chew, Jr. Rept. on ARO, Inc. Contract AF 40(600)800. Apr 60, 45p. 7 refs. AEDC-TN-60-69.
Order from LC mi$3.30, ph$7.80 PB 146 764

Tests were conducted in the 1-Foot Transonic Tunnel to determine optimum operating parameters which minimize tunnel interference effects with the 60-deg inclined hole, 6-percent open-area test section configuration. Pressure distributions on a 20-deg cone-cylinder model having a blockage ratio of 1.86 percent were used to determine optimum test section wall angle positions. A similar cone-cylinder model with 1-percent blockage ratio was used to investigate the effects of tunnel pressure ratio and support interference on base pressure measurements at various axial locations of the model in the test section. Minimum tunnel interference on the pressure distribution of the 20-deg cone-cylinder model resulted by varying the wall angle from 40-min convergence to 30-min divergence to 30-min divergence for a Mach number range from 1.10 to 1.50. Below Mach number 1.10 the effect of varying wall angle on the pressure distribution was negligible. Base pressure coefficients on the 1-percent blockage model as affected by the axial position in the tunnel and variations in tunnel pressure ratios are presented. (Author)

PRESSURE MEASUREMENTS IN AN ARC-DISCHARGE WIND TUNNEL, by M. R. Mulkey, W. T. Earheart, Jr., and E. E. McAdams, Jr. Rept. on ARO, Inc., Contract AF 40(600)700 Sup. 6(58-1). Apr 58, 31p. 2 refs. AEDC-TN-58-16; AD-152 048.
Order from LC mi$3.00, ph$6.30 PB 147 008

The pressure instrumentation for a 16-in. arc-heated hypervelocity wind tunnel is described. The tunnel has a Laval nozzle for expansion to supersonic speeds, a test section of uniform area, and a vacuum tank. Upstream of the Laval nozzle is a high-pressure reservoir in which the air is energized by arc-heating. Depending on the specific initial conditions, the run times varied from 25 to 40 msec. Commerical transducers and equipment were investigated, and the problem of electrical interference was studied. Low-impedance transducers and data-recording systems are discussed.

Arnold Engineering Development Center [Tullahoma, Tenn.]
WIND TUNNEL TESTS ON AN AERIAL TARGET MODEL AT TRANSONIC AND SUPERSONIC SPEEDS, by W. L. Chew and W. E. Carleton. Rept. on ARO, Inc., Contract AF 40(600)800. July 59, 110p. 3 refs. AEDC-TN-59-84; AD-219 990.
Order from LC mi$5.70, ph$16.80 PB 147 375

Static stability characteristics of the 0.22-scale aerial target model with attached launching lugs were investigated in the 1-ft transonic and supersonic tunnels. Test data were obtained at M = 0.8, 1.0, 1.2, 1.4 and 1.5 through an angle-of-attack range from 13^{o} to $+12^{o}$ in the transonic tunnel and M = 1.5 and 2.0 through an angle-of-attack range from -3^{o} to $+8^{o}$ in the supersonic tunnel. Reynolds numbers, based on maximum body diameter, were in the range from 0.52 to 0.68 million. Data showing the aerodynamic characteristics of the basic model and with launching lugs attached are presented as well as a comparison of the transonic and supersonic tunnel data at M = 1.5. The data show that the static stability characteristics of the aerial target model were only slightly affected by the attachment of launching lugs. Forebody axial force coefficients of the body-wing-tail configuration were increased by 38 to 48% with the launching lugs attached. Slight changes in normal force-curve slope, model stability, and in the roll-control effectiveness were indicated as the model was rolled from 0^{o} to $\pm 45^{o}$. (Author)

Avco-Everett Research Lab., Mass.
HALL EFFECTS IN A LAMINAR BOUNDARY LAYER OF THE HARTMANN TYPE, by James A. Fay. Rept. on Contract AF 49(638)659. Dec 59, 11p. Research rept. 81; AFOSR-TN-60-291.
Order from LC mi$2.40, ph$3.30 PB 147 434

The motion in a laminar boundary layer on an infinite flat plate with an applied magnetic field normal to the wall and current flow parallel to the wall is studied for the case of $\omega\tau$ (electrical cyclotron frequency times mean free time) not necessarily small. It is found that a cross flow is induced normal to both magnetic field and free stream flow. The net electrical power loss in the boundary layer is determined assuming constant transport properties. (Author)

BOUNDARY LAYER TRANSITION ON THE NOL STANDARD CONE IN THE BALLISTIC RESEARCH LABORATORIES' SUPERSONIC WIND TUNNELS, by J. C. McMullen. Feb 60, 23p. 1 ref. Technical note no. 1303.
Order from LC mi$2.70, ph$4.80 PB 147 105

Boundary layer transition Reynolds numbers on the Naval Ordnance Laboratory 5^{o} standard cone model were obtained in the Ballistic Research Laboratories' Supersonic Wind Tunnels No. 1 and No. 3. The transition point was determined photographically. Transition Reynolds numbers were computed and are compared with data from other wind tunnels. (Author)

Ballistic Research Labs., Aberdeen Proving Ground, Md.
TABLES FOR DETERMINATION OF FLOW VARIABLE GRADIENTS BEHIND CURVED SHOCK WAVES, by Nathan Gerber and Joan M. Bartos. Jan 60, 29p. 11 refs. Rept. no. 1086.
Order from LC mi$2.70, ph$4.80 PB 146 770

The shock wave relations and the equations of isoenergetic two-dimensional or axisymmetric flows can be combined to yield expressions for various useful quantities behind a shock wave if the curvature is known in addition to the position and slope. Tables are presented here of computations, for $\gamma = 1.4$, of seven functions of Mach number and shock wave slope, from which the following are easily computed: (1) streamline curvature, (2) velocity gradient along streamline, (3) angle between streamline and density contour, and (4) angle between streamline and Mach number contour. In addition, the Mach number and angle of inclination of streamline are listed. A Mach number range from 1.1 to 10 is covered by these computations. A derivation of the shock gradient functions is presented; and several applications of the calculations are given, including a set of tables for determining the slope of the sonic line. (Author)

Brown U. Div. of Applied Mathematics, Providence, R. I.
NON-UNIFORM SHOCK PROPAGATION IN A STRATIFIED ATMOSPHERE, by R. E. Meyer and D. V. Ho. Technical rept. no. 20 on Contract Nonr-562(07). July 59, 32p. 4 refs. Rept. 562(07)/20; AD-220 292.
Order from LC mi$3.00, ph$6.30 PB 147 094

To test an hypothesis of Whitham (J. Fluid Mech., 4, 1958, 337) an approximate solution is developed for the gas motion behind a very strong shock travelling into a perfect gas with density varying rapidly in the direction of shock propagation. The approximation is valid for arbitrary density variation for heavy gases with ratio of specific heats sufficiently close to unity, and it furnishes reliable (and quite simple) results for air for density ratios of up to about 3 and down to about 0.2. As far as the evidence collected here supports Whitham, it shows his hypothesis to be a small (entropy) variation approximation; but the approximation obtained from the interaction of the shock with a contact discontinuity turns out to be at least as good. (Author)

A STUDY OF CONFIGURATIONS COMPOSED OF A BODY UNDER A LIFTING WING IN SUPERSONIC FLOW, by C. F. Chen and Joseph H. Clarke. Rept. on Contract AF 49(638)444 and Subcontract to Applied Physics Lab., Contract NOrd-7386. Jan 60, 66p. 18 refs. AFOSR-TN-59-1276.
Order from LC mi$3.90, ph$10.80 PB 146 437

An investigation is made of supersonic aircraft configurations composed of a cambered body positioned a certain distance beneath an arbitrary lifting wing. The geometry of the wing is regarded as given and the geometry of the body may be given or optimum. Expressions for the drag and lift are obtained from reverse-flow considerations; these greatly implement such a study when interference cross-flows must be cancelled. The drag advantage to be gained when a given body and wing assume a given orientation is studied.

Brown U. Div. of Applied Mathematics, Providence, R. I.
SUPERSONIC FLOW PAST FINITE DOUBLE WEDGE WINGS OF VARIABLE THICKNESS. PART I. LINEAR VARIATION, by Maurice Holt and Bohyun Yim. Rept. on Contract AF 49(638)232. May 60, 37p. 4 refs. AFOSR-TN-60-431.
Order from LC mi$3.00, ph$6.30 PB 147 403

The pressure distribution and associated flow field is calculated on a finite span wing of double wedge section in a uniform supersonic stream. The wing is of constant chord and the leading edge is normal to the incident stream direction. The maximum thickness of the wing varies slowly in the spanwise direction so that the disturbed flow field is a small departure from plane flow. In this paper a wing with maximum thickness varying linearly with span is considered.

Brown U. Div. of Engineering, Providence, R. I.
TESTS OF A CONFIGURATION COMPOSED OF A BODY UNDER A LIFTING WING IN SUPERSONIC FLOW, by C. F. Chen. Rept. on Contract AF 49(638)444. Feb 60, 13p. 5 refs. Technical rept. WT-31; AFOSR-TN-59-1275. AD-233 944.
Order from LC mi$2.40, ph$3.30 PB 146 438

Tests were made on an arrangement consisting of a Sears-Haack body located under a lifting rectangular diamond profile wing. The Mach number was 1.6 and the Reynolds number was 9.17×10^{5} based on the body length. The experiments were suggested by a previous theoretical study of such arrangements. It is found that the measured lift developed on the wing due to the flow field of the body agrees very well with the theoretical value. Downstream of the impinging shock from the wing, flow separation was observed on the exterior side of the body but not on the interior side. The separation is attributed not to the pressure rise across the shock but to the pressure field arising from the reflection from the body of the shock-induced cross flow. Further observations suggest that the separation can be avoided by pitching the body or by kinking the body at the shock wave to accommodate the shock-induced cross flow. (Author)

SUPERSONIC FLUTTER ANALYSES INCLUDING AERODYNAMIC HEATING EFFECTS, by R. L. Harder, K. Lock and others. Rept. for June 58-Aug 59 on Dynamic Problems in Flight Vehicles, Contract AF 33(616)5767. Feb 60, 281p. 4 refs. WADC Technical rept. 59-559.
Order from OTS $4.00 PB 161 716

The purpose of this report is to study the effect that aerodynamic heating has upon the flutter calculation of a high speed wing. A short straight wing was analyzed in the Mach number range from one to five to see which parameters are the important ones to include in flutter calculations. Flutter results are given for several specific maneuvers and show that neglecting the effects of heating in the calculation may lead to unconservative results. (Author)

BOUNDARY-LAYER TRANSITION AND HEAT TRANSFER IN SHOCK TUBES, by R. A. Hartunian, A. L. Russo, and P. V. Marrone. Rept. on Contract AF 18(603)141. Dec 59, 37p. 33 refs. Rept. no. AD-1118-A-3; AFOSR-TN-59-564; AD-216 759.
Order from LC mi$3.00, ph$6.30 PB 146 973

An experimental study is made of the wall boundary layer in a shock tube operated over a wide range of shock Mach numbers and pressure levels in air, including those for which real gas effects exist. Transition distances are determined, and correlated in terms of the transition Reynolds number based on a characteristic length for this boundary layer. Data from independent shock-tube studies are also included in this correlation.

PRELIMINARY RESEARCH ON A MOLECULAR BEAM FOR THE 1-10 ev RANGE, by G. T. Skinner and C. E. Treanor. Rept. on Contract AF 18(603)141. Dec 59, 66p. 23 refs. Rept. no. AD-1118-A-9; AFOSR-TN-59-1086.
Order from LC mi$3.90, ph$10.80 PB 147 406

This report presents an interim discussion of the design and construction of a molecular-beam apparatus for the production of atomic and molecular beams in the 1-10 ev energy range. A shock tube is used as the source of high-temperature, high-pressure gas, and a hypersonic expansion is used to obtain a high-energy, nearly-mono-energetic beam. Use of a two-center potential for the treatment of atom-molecule collisions is discussed. (Author)

Cornell U. Graduate School of Aeronautical Engineering, Ithaca, N. Y.
THE RESPONSE OF LAMINAR BOUNDARY LAYER TO IMPULSIVE MOTIONS, by Martin L. Rosenzweig. Rept. on Contract AF 18(600)1523. Feb 59, 104p. 26 refs. AFOSR-TN-59-92; AD-210 182.
Order from LC mi$5.70, ph$16.80 PB 146 843

The main body of the present work is concerned with the response of the laminar boundary layer in 2 dimensional, incompressible flow to impulsive

changes in velocity. In particular, the problem of stagnation-point flow against a wall which moves impulsively in its own plane is considered. A method is developed for the solution of this problem. Applications of this method are then made to the case of linearized, unsteady, laminar boundary-layer flow. Detailed calculations are carried out to determine the oscillatory response of the laminar boundary layer when the basic steady flow is that given by the potential velocity distribution. The results of these calculations are then used to find the response to impulsive changes of velocity.

Institute for Fluid Dynamics and Applied Mathematics, U. of Maryland, College Park.
BOUNDARY-LAYER TRANSITION INDUCED BY A VIBRATING RIBBON ON A FLAT PLATE, by Francis R. Hama. Rept. on Contract AF 49(638)645. Feb 60, 34p. 18 refs. Technical note no. BN-195; AFOSR-TN-60-290.
Order from LC mi$3.00, ph$6.30 PB 146 423.

Flow patterns associated with the boundary-layer transition induced by a vibrating ribbon are investigated on a flat plate by means of visual observation of dye in a water tank. When amplified, the perturbation wave rolls up to form discrete vortices in the region near the critical layer. Transition never takes place before the discrete vortices are formed. The initially straight discrete vortices deform into three-dimensional vortex loops by picking up pre-existing disturbances and amplifying their effects. When the two-dimensional vortices become stronger, regularity in the transverse direction in forming the vortex loops is quite marked.

James Forrestal Research Center, Princeton, U, N. J.
EXACT SOLUTIONS FOR THE ONE-DIMENSIONAL VISCOUS FLOW OF A PERFECT GAS, by Gerald Rosen. Rept. on Contract Nonr-1858(25). July 59, 26p. 4 refs. Proj. Squid Technical rept. PR-93-P.
Order from LC mi$2.70, ph$4.80 PB 147 066

Velocity-free equations are derived for the unsteady one-dimensional real fluid flow of a perfect gas. These equations admit a pressure-time symmetry, a stress symmetry, and a displacement symmetry. Fundamental solutions associated with each of the three symmetries are reported. (Author)

STABILITY OF A SUPERSONIC LAMINAR BOUNDARY LAYER ON A FLAT PLATE, by John Laufer and Thomas Vrebalovich. Rept. on Contract DA 04-495-ORD-18. 1 Dec 58, 60p. 26 refs. Rept. no. 20-116; AD-216 343.
Order from LC mi$3.60, ph$9.30 PB 147 482

Self-excited oscillations have been discovered experimentally in a supersonic laminar boundary layer along a flat plate. By the use of appropriate measuring techniques, the damping and amplification of the oscillation amplitudes were studied and the stability limits were determined at free-stream Mach numbers 1.6 and 2.2. The wave nature of these disturbances was demonstrated and the wave velocities were measured using a specially designed "disturbance generator." The amplitude distribution across the boundary layer of the various fluctuating quantities associated with the oscillations revealed large temperature fluctuations that were approximately twice the velocity fluctuations. In general, the experiments confirmed the predictions of the existing stability theory. (Author)

REALISATION OF A MOLECULAR GUN OR COSMIC WIND TUNNEL, by F. Marcel Devienne. Technical note on Contract AF 61(052)296. Oct 59, 60p. 11 refs. AFOSR-TN-59-1292.
Order from LC mi$3.60, ph$9.30 PB 146 134

This report describes the building conditions of a molecular gun, that is to say an apparatus by means of which it is possible to reproduce conditions to which a solid body, moving at a cosmic speed, in a rarefied gas, is submitted. The apparatus is based on the exchange momentum between two crossed beams, one of these being a molecular beam corresponding to an ordinary temperature, and the other an ion beam in which the ions are accelerated by voltages included between a few volts and a few hundred volts.

Massachusetts Inst. of Tech., Cambridge.
FORCES AND MOMENTS ON OSCILLATING SLENDER WING-BODY COMBINATIONS AT SUPERSONIC SPEED. PART II. APPLICATIONS AND COMPARISON WITH EXPERIMENT, by Haim Kennet, Holt Ashley, and Robert L. Stapleford. Rept. on Contract AF 18(600)961. Dec 57, 74p. 8 refs. Fluid Dynamics Research Group rept. no. 57-5; AFOSR-TN-58-114; AD-152 022.
Order from LC mi$4.50, ph$12.30 PB 147 041

Several applications and extensions are described of a theoretical method for estimating aerodynamic loads on slender wing-body configurations performing small oscillations of limited reduced frequency in a supersonic main stream. This procedure involves an iterative technique in ascending orders of aspect ratio and frequency, to similar shapes in transonic flow. The theory is moderately successful as compared against experimentally determined lift-and moment-curve slopes for a family of delta-wing-body combinations in steady flow. It provides reasonable estimates of the damping in pitch measured on a particular rocket model over a range of supersonic Mach numbers. When applied to a series of possible missile shapes with systematically varied wing planforms, it reveals a strong influence of planform geometry on damping in pitch which cannot be calculated by the conventional slender-body approximation. (Author)

DAMPING OF RECTANGULAR PLATE VIBRATIONS, by T. S. Lundgren, C. C. Chang, and Y. C. Whang. Rept. for 11 June-30 June 59 on Materials Analysis and Evaluation Techniques, Contract AF 33(616)5426. Mar 60, 25p. 1 ref. WADC Technical rept. 59-544.
Order from OTS $0.75 PB 161 755

In Part A an analysis is made of the effect of an impact type damping mechanism on a vibrating square plate. The force which the damping mechanism exerts on the plate is idealized as a series of impulses acting at the center of the plate. It is found that the device analyzed does not make a very effective damper. In Part B an analysis is made of the effect of a damping device on the vibrations of a rectangular plate. The damper considered is a free piston in a closed cylinder which is attached to the center of the plate. When the leakage through the gap between the piston and the cylinder is small, the piston is caused to oscillate on the "spring" of air in the cylinder. It is found that this device can effectively damp out the resonant mode of the plate vibration. (Author)

BLOCKING IN THE OPEN-JET WIND TUNNEL, by Harold A. Mehaffey. Master's thesis. Oct 59, 57p. 4 refs. Technical rept. 388.
Order from LC mi$3.60, ph$9.30 PB 147 833

Criteria were established for the NSL, M = 4.80 open-jet wind tunnel. Two limits on model size and shape were found; (1) a maximum model frontal area; and, (2) a maximum bow shock strength independent of model frontal area. Additional factors affecting blocking were found to be stagnation pressure, stagnation temperature and diffusor efficiency. No method of evaluating these additional effects was found. The blocking criteria should be applicable for any continuous flow open-jet wind tunnel, with the limits determined by the particular tunnel circuit. (Author)

DESIGN, CALIBRATION AND ANALYSIS OF A HELIUM CONCENTRATION METER, by J. Richard Brown. Rept. on Contract AF 49(638)245. Dec 59, 32p. 7 refs. Technical rept. 416; AFOSR-TN-60-39.
Order from LC mi$3.00, ph$6.30 PB 147 782

The mass transfer investigation is concerned with the consequences of binary-mixture flow in the high speed boundary layer. Measurement of the boundary layer composition using a sound-speed concentration meter is an important part of the program. This report concerns the design, calibration and analysis of a helium concentration meter. It consists of the theory of operation and methods of calibration as well as the analysis and operational results obtained from a redesigned instrument.

Polytechnic Inst. of Brooklyn, N. Y.
THE INFLUENCE OF THE SHOCK CURVATURE ON THE BEHAVIOR OF HYPERSONIC BOUNDARY LAYER, by Antonio Ferri. Rept. on Contract AF 49(638)445. Feb 60, 47p. 15 refs. PIBAL rept. no. 542; AFOSR-TN-60-301.
Order from LC mi$3.30, ph$7.80 PB 147 044

For moderate values of Reynolds numbers the entropy gradients in the flow field affect the boundary layer in the region far from the nose. These effects are important for heat transfer, especially for a turbulent boundary layer. For moderate values of Reynolds numbers good results can be obtained by analyzing the boundary layer with correct local stagnation conditions and by neglecting the effect of velocity gradients outside the boundary layer. For lower Reynolds numbers, boundary layer type analysis can still be used; however, the effects of velocity gradients must be taken into account in stating the boundary conditions. The effect of vorticity in this case appears to be important.

Polytechnic Inst. of Brooklyn, N. Y.
SOME SIMILAR SOLUTIONS FOR INCOMPRESSIBLE LAMINAR BOUNDARY LAYER PROBLEMS, by Koon-Sang Wan. Rept. on Contract AF 49(638)445. Dec 59, 34p. 20 refs. PIBAL rept. no. 538; AFOSR-TN-59-1303.
Order from LC mi$3.00, ph$6.30 PB 146 768

Similar solutions to three types of laminar boundary layer problems are given in terms of known solutions The first problem pertains to unsteady laminar boundary layer when the external irrotational flow is inversely proportional to a linear function of time, and varies linearly in the direction of the main flow. The related heat transfer solution with isothermal heated surface is indicated. The second problem is the classical steady laminar boundary layer problem, but with the external irrotational flow given by $u_o (1+bx)^m$. The last problem is concerned with similar solutions for the boundary layer interacting with external inviscid rotational flow. A similar solution is obtained when the external vorticity is constant, large or small, and the external velocity varies as $U_o(1+bx)^{\frac{1}{3}} + \omega y$ or $U_o x^{\frac{1}{3}} + \omega y$. The latter case may be considered as a simple shear flow over a wedge with half wedge angle . (Author)

AN INVESTIGATION OF THE COANDA EFFECT FOR SUPERSONIC FLOWS, by Kuo-Tai Yen. Rept. on Contract AF 18(600)992. 18 Mar 54, 35p. 8 refs. TR AE5405; OSR-TN-54-130; AD-45 023.
Order from LC mi$3.00, ph$6.30 PB 147 012

The purpose of this work is to study the feasibility of utilizing the Coanda Effect to improve the mixing and induction of supersonic flows. The problem studied here is the flow phenomenon of two supersonic streams as the result of inserting a curved surface into the primary stream. An approximate theory based on the Prandtl-Meyer flow is developed for the determination of the contact discontinuity between the two streams. The laminar mixing along the contact discontinuity is then studied. It is shown that the mixing of the two streams can be improved appreciably provided certain temperature and Mach Number conditions for these two streams are satisfied. (Author)

Southampton U. (Gt. Brit.)
THE CHOICE OF AN OPTIMUM SET OF MEASUREMENTS TO STUDY ATOMIC RECOMBINATION IN NOZZLES, by K. N. C. Bray and J. P. Appleton. Technical (scientific) note no. 1 on Contract AF 61(052)250. Nov 59, 45p. 16 refs. USAA Rept. no. 120.
Order from LC mi$3.30, ph$7.80 PB 146 915

This note is concerned with the accuracy of experiments designed to study the process of atomic recombination in a hypersonic wind tunnel nozzle. Three types of experiment are considered: (i) to determine whether a given flow is closer to the equilibrium or the frozen state, (ii) to determine the dissociation fraction in the test section of the nozzle, and (iii) to determine the recombination rate constant. It is shown that the overall accuracy of all these experiments, particularly the first one, is greatly affected by the choice of the various quantities to be measured, and in some cases errors of several thousand per cent are predicted. Recommendations are made for the choice of optimum measurements for recombination experiments.

Space Sciences Lab., General Electric Co., Philadelphia, Pa.
LINEARIZED THEORY OF AIRFOILS IN FLUIDS OF LOW ELECTRICAL CONDUCTIVITY, by S. I. Pai. Rept. on Contract AF 04(647)269. Dec 59, 28p. Technical Information Series R60SD311.
Order from LC mi$2.70, ph$4.80 PB 147 298

A uniform steady flow of compressible fluid of low electrical conductivity past thin magnetized bodies has been studied. Because of the thinness of the body and the small electrical conductivity of the fluid, the fundamental equations of magnetogasdynamics may be linearized. The external electromagnetic fields are under the control of the designer of the aircraft and independent of the flying conditions. Hence we may use the electromagnetic fields as a control device for the aircraft flying in a fluid of low electrical conductivity. The effectiveness of this device is proportional to the magnetic parameter R_M. (Author)

Stanford Research Inst., Menlo Park, Calif.
AERODYNAMIC CHARACTERISTICS OF TRAILING-WIRE ANTENNAS AT SUPERSONIC SPEEDS, by F. B. Harris, Jr. Technical rept. 68 on Contract AF 19(604)3458. Mar 60, 88p. 12 refs. AFCRC-TN-60-198.
Order from LC mi$4.80, ph$13.80 PB 147 050

Severe difficulties associated with the design of satisfactory flush-type HF transmitting antennas for supersonic aircraft have prompted a reconsideration of trailing-wire antennas for such vehicles. The aerodynamic instabilities which caused mechanical failure of the trailing-wire type of antenna and led to its abandonment except in low-speed applications are carefully examined in this report.

University of Southern California. Engineering Center, Los Angeles.
A SEMI-AUTOMATIC McLEOD GAUGE, by Herbert R. Pass. Rept. on Contract AF 18(603)95. 31 Mar 60, 42p. 2 refs. USCEC rept. 56-211; AFOSR-TN-60-399.
Order from LC mi$3.30, ph$7.80 PB 147 299

A semi-automatic McLeod gauge has been designed and built for use in the USC low-density wind tunnel. The gauge is mounted inside the tunnel and is remotely controlled and remotely read. Control is obtained by means of an electro-pneumatic circuit using electrodes that are inserted through the glass walls; the reading is obtained electrically using a circuit consisting of, in part, a constant-current generator, tungsten wires that are placed in the bores of the capillaries, and a strip-chart recorder. The design is relatively simple, inexpensive, and reliable; although, operationally it is somewhat unwieldy. (Author)

AER, Inc. [Pasadena, Calif.]
THE DESIGN OF THREE HORIZONTAL MOMENTUM EXCHANGE WATER BRAKES FOR THE U. S. NOTS 'SNORT' LIQUID ENGINE SLED, by R. E. Oliver. Rept. on Contract N123(60530)11868A. Dec 59, 114p. 5 refs. NOTS TP-2390; NAVORD rept. 7024.
Order from LC mi$6.00, ph$18.30 PB 146 921

Three momentum exchange water brakes were designed to produce decelerations of 10.0g ±1.0g, 5.0g ±0.5g, and 2.5g ±0.25g for sled weights of 4, 254, 4, 254 and 10, 800 lb_w respectively, and water-contact velocities of 1, 250, 1, 250 and 636 ft/sec respectively. These decelerations were to be maintained until the sled velocity decreased to 300 ft/sec. The water surface profile was not specified beforehand, but was determined in conjunction with the design of the scoop shapes. One water surface profile was to be used for all three brakes. A primary consideration in the structural design of the brakes was simplicity. The stress analysis was carried out on the basis of a design stress of one-half the ultimate stress of the material (i.e., a safety factor of 2.0 based on ultimate strength). In order to provide an experimental check on the predicted forces on the brakes, force-measuring mounts were included in the design. (Author)

Aeronautical Accessories Lab., Wright Air Development Div., Wright-Patterson AFB, Ohio.
DEVELOPMENT OF AGENT FLOW MEASUREMENT METHODS, by Ralph L. Hough and William R. Kane. Mar 60, 46p. 8 refs. WADC Technical note 59-183.
Order from OTS $1.25 PB 161 726

Instrumentation for measuring the rapidly changing flow of agent in fire-extinguishing systems was very limited, unrefined, or nonexistent. Highly transitory discharge, with abrupt beginning and end, occurs in these systems. Total discharge time covers only a few seconds. Methods were needed for measuring the average flow rate and the instantaneous velocity of the agent. Several instrument ideas were developed, instrument design engineering explored, and resultant techniques tested. A highly refined phase-change indicator was developed, capable of measuring initial agent velocity as well as average agent flow rate. Of the techniques examined for determining instantaneous velocity, using phosphor-decay rates appears most promising. Methods devised pertain not only to resolving problems in relation to fire-extinguishing systems, but to other problems concerning transient flow in hydrodynamic systems. (Author)

SPHERICAL EXPLOSIONS IN SEA WATER, by S. A. Berger and M. Holt. Technical rept. no. 19 on Contract Nonr-562(07). Apr 59, 158p. 60 refs. Rept. 562(07)/19.
Order from LC mi$7.50, ph$24.30 PB 146 053

In this report the field of disturbance due to the detonation of a bared spherical charge of PETN in sea water is calculated. The equations of unsteady motion of a compressible fluid with spherical symmetry are written in Eulerian form and integrated numerically by the method of characteristics. Three distinct regions have to be considered, the compressed water region behind the main blast wave, the region of expansion of the detonation products, and the explosive gas region between the outer boundary of this expansion, which develops into a second shock wave, and the boundary of the gas bubble. Special attention is given to fitting the boundaries of these regions, the outer boundary of the detonation region, the second shock wave, gas-water contact discontinuity and main blast wave. A Jones equation of state is used in the product gases and a Tait equation of state is used in sea water.

RESISTANCE COEFFICIENTS FOR ACCELERATED FLOW THROUGH ORIFICES, by James W. Daily and Wilbur L. Hankey, Jr. Technical rept. no. 10 on Contract N5ori-07826. Oct 53, 23p. 10 refs. AD 28 572.
Order from LC mi$2.70, ph$4.80 PB 147 157

The investigation of fluid friction in unsteady motion was extended to include the frictional resistance caused by orifices in accelerated flow. Two different orifices were investigated, each located in a region of fully developed conduit boundary layer and velocity profile. Orifices of area ratios 0.5 and 0.7 were installed 38.5 diameters from the entrance nozzle in a 1-in. -diam tube, and the velocity and acceleration of flow were programmed by a servomechanism controlling the pressure difference between the supply and receiving tanks of the water tunnel. The tests covered a conduit Reynolds number range from 5×10^4 to 3×10^5 and accelerations up to 35 ft/sec/sec. The results showed that (1) the coefficient of head drop is independent of the Reynolds number and is a function of the acceleration parameter; (2) the frictional resistance for a given instantaneous velocity of

flow through an orifice is appreciably less than for steady flow at the same velocity; and (3) the frictional resistance for a given instantaneous velocity of accelerated flow through an orifice decreases with increasing acceleration. A reanalysis was made of previous measurements with a clear conduit, and this analysis indicated that (1) the coefficient of head drop is a function of the Reynolds number as well as the acceleration parameter; and (2) the frictional resistance for a given instantaneous velocity of accelerated flow through a uniform diameter smooth tube is equal to or possibly slightly greater than that for steady flow at the same velocity.

Institute for Fluid Dynamics and Applied Mathematics, U. of Maryland, College Park.
CYLINDRICAL SHOCK WAVES PRODUCED BY INSTANTANEOUS ENERGY RELEASE IN MAGNETOGAS DYNAMICS, by S. I. Pai. Rept. on Contract AF 18(600)993. Feb 58, 32p. 4 refs. Technical note BN-120; AFOSR-TN-58-215; AD-154 116.
Order from LC mi$3.00, ph$6.30 PB 147 454

The behavior of a cylindrical shock wave produced by instantaneous energy release along a straight line of infinite extent in a conducting gas subjected to a mag netic field with circular lines of force has been analyzed. Initially the gas is at rest and has constant temperature. Both the initial density and the initial magnetic field H_{Θ_e} are assumed to be inversely proportional to some power of the radial distance r. It was found that similar solutions exist only if H_{Θ_0} is proportional to 1/r. Similar solutions for various initial density distributions have been obtained. Numerical examples are given for constant initial density. The magnetic field has great influence on the pressure distribution but little influence on the density distribution within the shock. The pressure near the shock front is increased by the magnetic field while that near the center of the region is decreased. In general, the magnetic field increases the flow velocity within the cylindrical shock. (Author)

A STUDY OF THE MEAN THICKNESS OF THE LIQUID FILM AND THE CHARACTERISTICS OF THE INTERFACIAL SURFACE IN ANNULAR, TWO-PHASE FLOW IN A VERTICAL PIPE, by D. A. Charvonia. Interim rept. no. 59-1 on Contracts Nonr-1100(14) and N6ori-105(03). May 59, 266p. 35 refs. Proj. Squid Technical rept. PUR-39-T-R.
Order from LC mi$11.10, ph$41.10 PB 145 908

An experimental investigation of annular, two-phase flow was conducted in a vertical tube, 2.498 in. ID and 28 in. long, employing water and air at ambient temperatures and pressures as the liquid and gaseous media respectively. An analysis of downward, annular, two-phase flow is presented and the results of that analysis are compared graphically with those from the experimental investigations. The experimental studies were concerned with extremely thin liquid films. The results of the investigation indicate that the amplitudes and frequencies of the interfacial waves are related by definite spectra. The analysis provides a method for predicting the mean liquid film thickness and pressure gradient in the gas stream in downward, annular, two-phase flow if the rates of flow of the two fluid media, their physical properties, and the pipe diameter are known.

Naval Ordnance Test Station [China Lake, Calif.]
ON THE MOTION OF VORTICES BEHIND A CIRCULAR CYLINDER, by I. Michelson. 29 Oct 51, 26p. 9 refs. Technical memo. 377.
Order from LC mi$2.70, ph$4.80 PB 146 945

The flow of a uniform stream of perfect (i.e., incompressible and inviscid) fluid past a circular cylinder and two nearby complex, vortex-line singularities is considered. For the most part, interest is confined to the flow in which the singularities are symmetrically situated downstream of the cylinder. The classical methods of potential theory are applicable to the study of the resulting unsteady motion, and a large amount of information is thus obtained concerning the kinematics of the entire motion as well as the forces and pressures which act on the cylinder.

METALLURGY

Armour Research Foundation, Chicago, Ill.
DEVELOPMENT OF PARTIALLY VOLATILE BRAZING FILLER ALLOY FOR HIGH-TEMPERATURE APPLICATION AND RESISTANCE TO OXIDATION, by William M. Lehrer and Harry Schwartzbart. Rept. for 1 Apr 58-31 Mar 59 on Metallic Materials, Contract AF 33(616)5654, continuation on Contract AF 33(600)33406. Dec 59, 45p. 7 refs. WADC Technical rept. 59-404; AD-232 969.
Order from OTS $1.25 PB 161 746

Experimental brazing filler alloys have been developed containing temperature depressants which have been volatilized during the brazing of stainless steel, leaving joints of high remelt temperature. The mechanisms by which remelt temperature is increased have been studied for the range of alloys investigated which contained nickel, chromium, germanium, iron, lithium, and phosphorus. The two main mechanisms are (i) dissolution of the base metal in the filler metal and diffusion of constituents of the filler metal into the base metal and (ii) volatilization of the filler metal constituents. It has been shown theoretically and experimentally that in order for remelt temperature to increase there must be solid solubility of the diffusing or volatile element in the filler alloy. (Author)

Bell Aircraft Corp. [Buffalo, N. Y.]
MECHANICAL PROPERTIES OF SELECTED ALLOYS AT ELEVATED TEMPERATURES, PART I, by Harry A. Pearl, George F. Kappelt, and Edmund J. King. Rept. for July 58-Sep 59 on Materials Application, Contract AF 33(616)5760. Mar 60, 268p. WADC Technical rept. 59-702, Pt. 1.
Order from OTS $4.00 PB 161 761

Six materials in plate and bar form were subjected to tension, compression, bearing, and shear stresses at various temperatures after exposure times of 1/2, 10, 100, and 1000 hours at selected test temperatures. The materials studied and the temperature range of testing were: AM 355 - R. T. - 1000°F, PH 15-7M° - R. T. - 1000°F, HK31-H24 - R. T. - 600°F, A 286 - R. T. - 1200°F, Udimet 500 - R. T. - 1700°F and Inconel X - R. T. - 1500°F. In general the test results show that most of the material properties regardless of the type of stress imposed decrease with temperature and time. Time of exposure was not as effective in lowering the properties as the temperature. The A 286 alloy did show mechanical properties higher after prolonged exposure due to aging at some temperatures. The sharp drop off in properties that the other alloys exhibited at the higher temperatures was not characteristic of the A 286 alloy. Comparisons between alloys are made only where the temperature range of operation is common to both. (Author)

RANDOMIZED SEEDING OF OROGRAPHIC CUMULUS, 1957: PART I, by Louis J. Battan and A. Richard Kassander (U. of Arizona). Rept. on Contracts AF 19(604)1388 and NSF Grant G-4175. 15 Feb 58, 22p. 3 refs. Cloud Physics Lab. Technical note no. 12.
Order from LC mi$2.70, ph$4.80 PB 137 727

This report deals with a description of the design of the experiments and a summary of the analysis of the rain gage data. During the summer of 1957 there were 16 pairs of days studied. The analysis suggests that seeding had a positive effect, but statistical tests show that the differences between the rainfall on seeded and non-seeded days could not be shown to be statistically significant at an acceptable confidence level.

General Mills, Inc., Minneapolis, Minn.
ELECTRON MIRROR MICROSCOPY IN MAGNETIC AND METALLURGICAL STUDIES, by Ludwig J. Mayer. Final rept. for 1 Oct 57-30 Sep 59 on Contract AF 33(616)3852. Oct 59, 81p. 46 refs. WADC Technical rept. 59-640.
Order from OTS $2.25 PB 161 710

Electron mirror microscopy (EMM) can be utilized for the observation of magnetic patterns recorded on magnetic tapes. EMM reveals magnetic domain patterns in magnetic materials with a uniaxial direction of easy magnetization and in materials with several directions of easy magnetization exhibiting basically flux closure domain configurations. On silicon-iron three types of domain manifestations were observed. Motion pictures photographed directly from the screen of the electron mirror microscope portray quite adequately the domain patterns set in motion by applied magnetic fields. EMM is particularly well suited for direct visual observation of magnetic stray fields at grain boundaries. It is also possible to observe domain and domain movement in the different types of thin magnetic films. A method of magnetic writing is possible which is based on a local reversal of the direction of magnetization in suitable premagnetized film by temporarily elevating the temperature above the Curie point. By utilizing the dissipation energy of a focused electron beam for this purpose quite well defined traces of reversed magnetization could be recorded on MnBi films. These traces were magnetically erasable. Writing speeds of 3×10^4 bits/sec and information densities of 10^5 bits/cm^2 could be achieved. With a newly designed vacuum hot stage, the formation of MnBi films was observed by means of the Kerr magneto-optic effect, thus achieving for the first time visual observation of the nascent state of ferromagnetism. Experiments showed that uniform MnBi films grow from only a few randomly distributed nucleation spots.

Grumman Aircraft Engineering Corp., Bethpage, N. Y.
EVALUATION OF TITANIUM SHEET ALLOYS, by Francis X. Drumm. Quarterly progress rept. no. 3, 1 July-30 Sep 58, on Contract NOas-58-100C. 30 Oct 58, 31p. Rept. R 82053013.3.
Order from LC mi$3.00, ph$6.30 PB 137 867

Progress consisted of preliminary manufacturing evaluation, which included bend testing, adhesive bonding, dimpling and resistance spot welding. The effect of elevated temperatures upon solution heat treated material was investigated.

Illinois U., Urbana.
PROTECTIVE COATINGS FOR REFRACTORY METALS, by Clifton G. Bergeron, Arthur L. Friedberg and others. Rept. for June 58-Aug 59 on Ceramic and Cermet Materials, Contract AF 33(616)5734. Jan 60, 50p. 45 refs. WADC Technical rept. 59-526.
Order from OTS $1.25 PB 161 739

Tests with tungsten wire encapsulated in evacuated fused silica tubes demonstrated the impermeability of oxygen at temperatures above 3000°F. for several hours, as evidenced by the non-oxidation of the encased tungsten. Preliminary experiments showed that oxygen-free atmospheres, but not high vacuum conditions, were required for successful application of ceramic coatings on tungsten. Vitreous-bonded coatings, consisting of zircon and a low expansion refractory glass, protected tungsten wire specimens at temperatures of 3600°F. for 3-1/2 hours using a direct resistance heating test. Combinations of silicide and vitreous-bonded coatings, SiO coatings, and flame-sprayed coatings were investigated. (Author)

INVESTIGATION OF HIGH-TEMPERATURE NOTCH SENSITIVITY IN A LOW-CARBON CR-MO-V PIPING STEEL, by R. B. Niederberger. 24 Mar 59, 22p. 16 refs. Research and Development rept. 910038E; AD-215 987.
Order from LC mi$2.70, ph$4.80 PB 147 483

Notched and smooth bar rupture data, at temperatures of 1000° and 1100°F and times up to several thousand hours, are presented for a low-carbon Cr-Mo-V steam piping steel. It was found that notch sensitivity was dependent on stress as well as rupture time and temperature.

New York U. Coll. of Engineering, N. Y.
DEVELOPMENT OF PROTECTIVE COATINGS FOR REFRACTORY METALS, by C. G. Goetzel, P. S. Venkatesan, and R. F. Bunshah. Rept. for 1 June 58-31 May 59 on Ceramic and Cermet Materials, Contract AF 33(616)5735. Feb 60, 57p. 44 refs. WADC Technical rept. 59-405.
Order from OTS $1.50 PB 161 736

A preliminary study of the feasibility of protecting tungsten against oxidation at 1650°C (3000°F) was undertaken. Rhodium was selected from the noble metal group as the most promising metallic type of coating. It was applied by electrolytic deposition, either directly onto thoriated or pure tungsten wires, or onto intermediate coats containing the elements rhenium, chromium and silicon. These sub-coats served several purposes, such as: (1) providing a layer of intermediate expansion characteristics between those of the substrate and the rhodium coat; (2) modifying the oxides formed on the surface of the substrate; or (3) promoting the formation of liquid phases at the surface that would freely flow and seal exposed areas of the substrate.

WELDING OF HIGH-STRENGTH STEELS FOR AIRCRAFT AND MISSILE APPLICATIONS, by H. W. Mishler, R. E. Monroe, and P. J. Rieppel. Rept. on Contract AF 18(600)1375. 12 Oct 59, 93p. 43 refs. DMIC rept. 118; AD-228 629.
Order from OTS $2.25 PB 151 074

This report summarizes the materials and procedures currently being used in the aircraft and missile industry to arc and resistance weld high-strength steels. The steels discussed are (1) low-alloy martensitic steels, (2) hot-work die steels, (3) martensitic stainless steels, and (4) precipitation-hardening stainless steels. For each class of steel, welding techniques and procedures are discussed, arc-welding filler materials are described, and mechanical properties of arc and resistance welds are listed. A discussion is included of design, testing, and inspection techniques as applied to weldments made from these high-strength steels. (Author)

Naval Research Lab., Washington, D. C.
CRACK PROPAGATION TESTS OF HIGH-STRENGTH SHEET MATERIALS. PART IV. THE EFFECT OF WARM PRE-STRAINING, by J. E. Srawley and C. D. Beachem. 18 Apr 60, 20p. 5 refs. NRL Rept. 5460.
Order from OTS $0.50 PB 161 355

Evidence is presented that the weakening effect of the cracks provided in crack-propagation test specimens of high-strength sheet steels may be substantially mitigated by straining at moderately elevated temperatures, where the mode of fracture is entirely shear, before testing at lower temperatures. The improvement in load-bearing capacity of the specimens resulting from the pre-straining treatment is greater the lower the testing temperature. The effect is believed to be mainly a result of blunting of the crack fronts in the vicinity of the specimen surfaces by plastic flow and shear cracking during pre-straining. It might be of some practical value in reducing the effective severity of undiscovered cracks in certain thin-walled structures, thus improving the integrity of such structures. INVESTIGATION OF COLUMBIUM AS AN ELECTROLYTIC CAPACITOR ANODE, by Clyde Peabody and Albert Lunchick. 15 Aug 59, 17p. 1 ref. USASRDL Technical rept. 2069; AD-226 038.
Order from LC mi$2.40, ph$3.30 PB 146 935

The metal columbium was studied as an electrolytic capacitor anode. Samples of columbium anodes both in unetched foil and sintered pellet form were anodized and compared with tantalum controls. Higher capacitance values for the columbium electrolytics were observed, but the capacitance gain promised by the higher dielectric constant of columbium oxide was not fully realized due to the thicker columbium oxide films. For similar density ratios of columbium and tantalum sintered pellets, however, better than 80% capacitance gain per unit volume was realized with columbium. Wet dissipation factors of columbium specimens were similar to those for tantalum. The d. c. leakages of the former were higher, although still well within practical limits. (Author)

Defense Metals Information Center, Battelle Memorial Inst., Columbus, Ohio.
OXIDATION BEHAVIOR AND PROTECTIVE COATINGS FOR COLUMBIUM AND COLUMBIUM-BASE ALLOYS, by W. D. Klopp. Rept. on Contract AF 18(600)1375. 15 Jan 60, 97p. 63 refs. DMIC Rept. 123.
Order from OTS $2.25 PB 151 080

Available information on the oxidation behavior of and protective coatings for columbium and columbium-base alloys is summarized and discussed. Unalloyed columbium forms a tarnish film and reacts parabolically with air or oxygen up to about 450 C. In this temperature range the protective film blisters and unprotective, white Cb_2O_5 forms. Oxidation behavior is linear after formation of Cb_2O_5, the rate increasing appreciably with increasing temperature. Cb_2O_5 is solid to 1500 C. Binary additions which improve the oxidation resistance include Ti, Zr, Mo, W, Cr, and V. Ti and Zr also improve the contamination resistance of columbium. Ternary and higher alloying produces further significant improvements in oxidation behavior by promoting formation of complex oxide scales. Several of the best systems are Cb-Cr-Al, Cb-Fe-Al, Cb-Mo-Al, Cb-Ti-Al, and Cb-Ti-Cr. Improvements up to 1000-fold over unalloyed columbium are possible, but the most oxidation-resistant alloys are unfabricable. Information on protective coatings for columbium is limited. The best coatings to date appear to be a duplex LM-5 coating and a modified Ni-C coating. (Author)

Armour Research Foundation, Chicago, Ill.
A STUDY OF TERNARY PHASE DIAGRAMS OF TUNGSTEN AND TANTALUM, by W. Rostoker. Rept. for 1 Apr 58-31 July 59 on Metallic Materials, Contract AF 33(616)5678. Mar 60, 93p. 41 refs. WADC Technical rept. 59-492.
Order from OTS $2.25 PB 161 709

Phase relationships in 36 ternary refractory metal systems were investigated. Some 28 related binary systems were first established by reviewing the literature and doing whatever supplementary experimental work necessary to assure a valid basis for the ternary studies. Nearly 200 ternary alloy compositions were prepared from high-purity alloying ingredients by nonconsumable electrode arc-melting procedures. These alloys were studied metallographically in the as-cast condition as well as after annealing at and quenching from 1500 and 1000°C. The main purpose of this effort was to scan the solid solubility limits of ternary systems based on tungsten and/or tantalum and involving the following metals: molybdenum, niobium, vanadium, chromium, osmium, and rhenium. The diagrams presented herein are intended to serve as a foundation for future alloy development. Because none of the systems presented is completely detailed, definitive work can and should be done as the specific need arises. (Author)

AN INVESTIGATION OF THE STRUCTURE OF COPPER AFTER EXPOSURE TO VERY INTENSE STRESS WAVES, by G. Moss and C. Glass. Feb 60, 19p. 12 refs. BRL memo. rept. 1248.
Order from LC mi$2.40, ph$3.30 PB 147 490

X-ray diffraction techniques were used to examine an explosively loaded copper single crystal for presence of macro-twins and kink bands. The results did not indicate the presence of mechanical macro-twins, but instead kink bands which are commonly found in slowly deformed copper. (Author)

Battelle Memorial Inst., Columbus, Ohio.
INVESTIGATION OF THE PROPERTIES OF TANTALUM AND ITS ALLOYS, by Frank F. Schmidt, William D. Klopp and others. Rept. for 1 May 58-31 Dec 59 on Metallic Materials, Contract AF 33(616)5668. Mar 60, 112p. 53 refs. WADD Technical rept. 59-13.
Order from OTS $2.50 PB 161 758

The reactions of unalloyed tantalum with air, nitrogen, and oxygen were studied. Vacuum sintering of high-purity and high-impurity-content tantalum powders was investigated to determine the conditions required for purification. The effects of alloying on the oxidation behavior of tantalum were determined. Several alloying elements were found to be effective in reducing both scaling and contamination. Interstitials were studied for their effects on mechanical behavior at low and elevated temperatures. Screening studies were conducted on the effects of substitutional alloying on mechanical properties at room temperature and at 2200°F. References are included. (Author)

CREEP AND PLASTIC DEFORMATION IN CYLINDRICAL SHELLS, by Alfred M. Freudenthal and Maciej P. Bieniek. Rept. for Dec 58-May 59 on Materials Analysis and Evaluation Techniques, Contract AF 33(616)6112. Mar 60, 21p. 2 refs. WADC Technical rept. 59-399.
Order from OTS $0.75 PB 161 706

In the first part of this report, the problem of creep deformation and bending moments in the vicinity of a freely supported or fixed end of a long, cylindrical shell is solved under conditions of stationary (second stage) creep, using an approximate method based on extremum principles of dissipative media which are valid for the assumed uni-axial and non-linear creep-law $\dot{\varepsilon} = K\sigma^n$. The results of analysis are checked by experiment. In the second part of this report results of tests of steel cylinders under internal pressure, producing large plastic deformation, are given, illustrating the relation between problems of non-linear creep and plastic deformation. (Author)

ALUMINUM ALLOY CORROSION EVALUATION, by Franklin J. Gillig. Final rept. on Contract NObs-72056. 30 Sep 58, 26p. 1 ref. Rept. no. KC-1042-M-11; AD-213 449.
Order from LC mi$2.70, ph$4.80 PB 147 018

Five aluminum alloys 5154, 5356, 6063, 6061 and 5083 were evaluated to determine the effects of possible aircraft carrier deck environments on their mechanical properties and corrosion resistance. The environments included intermittent and continuous exposures to temperatures between 100°F and 1000°F. Mechanical property, intergranular corrosion, and stress corrosion data are given. No difference in the effect of intermittent and continuous exposures to a given temperature was found as long as the cumulative time at temperature was the same. Stress corrosion failures were encountered only in the 5083 alloy exposed to 300°F for 150 hours. (Author)

Cornell Aeronautical Lab., Inc., Buffalo, N. Y.
INVESTIGATION OF THE COMPRESSIVE, BEARING, AND SHEAR CREEP-RUPTURE PROPERTIES OF AIRCRAFT STRUCTURAL METALS AND JOINTS AT ELEVATED TEMPERATURES, by Luke A. Yerkovich.

Rept. for 1 June 58-31 July 59 on Materials Analysis and Evaluation Techniques, Contract AF 33(616)5772. Mar 60, 111p. 6 refs. WADC Technical rept. 59-572.
Order from OTS $2.50 PB 161 717

This report summarizes in tabular and chart form the high temperature short time deformation properties of 16 V- 2.5 Al titanium alloy and Vascojet 1000 alloy steel in tension, compression, bearing and shear. In addition, correlations of the tensile creep-rupture properties with corresponding compression, bearing and shear creep-rupture properties are presented. The creep-rupture characteristics of single-rivet lap type joints and two-rivet doubler type joints prepared from the test alloys are presented. Correlations between measured joint creep-rupture and predicted joint creep-rupture are included. (Author)

Dayton U. Research Inst., Ohio.
FURTHER INVESTIGATION OF THE EFFECTS OF MOLTEN BORON OXIDE ON HIGH TEMPERATURE MATERIALS, by Joseph W. Rosenbery. Rept. on Aviation Fuels, Contract AF 33(616)3898. Jan 60, 102p. 11 refs. WADC Technical rept. 59-205.
Order from OTS $2.50 PB 161 703

The corrosion resistance of a group of high temperature materials, typical of those available for use in aircraft power plants, was evaluated in a boron oxide environment. Exposure consisted of cyclic immersion in B_2O_3 at temperatures of 1750° - 2200°F. for periods up to 145 hours in an air atmosphere. The results indicate aluminum, manganese, and carbon as alloy constituents are detrimental to corrosion resistance, while Si appears to produce beneficial effects. Several possible mechanisms of attack by molten boron oxide are postulated to explain the data.

Denver Research Inst., Colo.
DEVELOPMENT OF A COPPER-BASE CERMET BY THE MELT-SATURATION METHOD, by Leonard E. Olds. Summary rept. for 5 Dec 56-5 Aug 57 on Subcontract MOSD 60145 to Contract AF 04(645)24. 15 Aug 57, 33p. 10 refs.
Order from LC mi$3.00, ph$6.30 PB 147 737

The melt-saturation method is a process of forming a ceramic compound in a metal by precipitating the compound from a liquid solution. This report describes the preparation by this method of copper alloys nominally containing 0.5, 1, 2, and 4 percent ThB_4. Significant improvements were obtained in elevated temperature strengths, the Cu-4% ThB_4 alloy having almost four times the strength of pure copper at 1800°F. The ductility loss associated with this strengthening was approximately 30 to 40 percent. Metallographic and X-ray diffraction examinations indicated that both the ThB_4 and the ThB_6 phases were precipitated from the copper melt. The strengthening of the alloys by these phases appears to be associated with the formation submicroscopic borides even though all of the alloys prepared for this study contained massive borides with variable amounts of segregation. Attempts were made to measure the thermal diffusivity of the alloys; however, the tests were made under conditions which led to unreliable results. Some evidence was obtained to indicate an unbalance in alloy composition with a resulting excess of either boron or thorium in solid solution. Under such conditions the thermal conductivity of the alloys would be low. (Author)

Digital Computer Lab., U. of Illinois, Urbana.
CALCULATION OF ORDER PARAMETERS IN A BINARY ALLOY BY THE MONTE CARLO METHOD, by Lloyd D. Fosdick. Rept. on Contract Nonr-1834(27). 7 Apr 59, 27p. 12 refs. Rept. no. 87.
Order from LC mi$2.70, ph$4.80 PB 146 033

A sampling scheme used by others in equations of state computations for gases has been used to investigate order-disorder phenomena in a face-centered cubic A_3B alloy, Cu_3Au.

Franklin Inst. Labs. for Research and Development, Philadelphia, Pa.
DISLOCATIONS IN DEFORMED SINGLE CRYSTALS OF α-BRASS. PART II. PILE UPS, by J. D. Meakin and H. G. F. Wilsdorf. Rept. on Contract AF 49(638)162. Feb 60, 29p. 20 refs. Interim rept. IIA2027-2; AFOSR-TN-60-4.
Order from LC mi$2.70, ph$4.80 PB 147 282

An etching technique has been used to investigate the dislocation structure of deformed alpha brass single crystals. Divergences between the experimental and theoretical spacings in the isolated pile-ups and the origin of the stress maintaining the pile-ups are discussed. (See also PB 144 570)

Georgia Inst. of Tech. Engineering Experiment Station, Atlanta.
THIN METAL FILMS AS CORROSION INDICATORS, by Richard B. Belser and Niels Engel. Rept. for 15 Nov 58-31 Dec 59 on Finishes and Materials Preservation, Contract AF 33(616)3879. Mar 60, 74p. 12 refs. WADC Technical rept. 59-759.
Order from OTS $2.00 PB 161 757

Thin metal films were evaluated as corrosion indicators for packages. Over 500 films deposited on glass substrates were examined by exposure in sealed containers at 25°C and at known relative humidities of from 0 to 70 percent. Iron, copper, manganese, magnesium and bimetal iron-copper films were studied. Although pure metal films did not corrode to a significant degree at 70% R. H. additions of sensitizing materials such as acid fumes or inorganic salts to the films caused them to deteriorate rapidly at these conditions. Such sensitization occurred inadvertently during specimen preparation unless suitable precautions were taken. (Author)

Instrumentation Lab., Mass. Inst. of Tech., Cambridge.
THE PROPERTIES OF METALS AND ALLOYS OF PARTICULAR INTEREST IN PRECISION INSTRUMENT CONSTRUCTION; COMPILATION OF DATA FROM VARIOUS HANDBOOKS AND OTHER SOURCES, by L. M. Schetky. Rept. on Contract AF 33(616)2039. Jan 57, 42p. Rept. R-137; AD-144 130.
Order from LC mi$3.30, ph$7.80 PB 147 266

The present compendium is a selection of values felt to be the best available at this date. In several classes of alloys the properties will vary widely with heat treatment and method of fabrication. As a criterion for selection of a material destined for use in restricted space or under conditions calling for low weight, the parameter strength-to-weight ratio is often used; in the field of precision instruments this is a misleading guide, since for reasons of dimensional stability it is desirable to operate well within the stress level of the elastic limit. In this list of properties is a value for the elastic limit/density ratio and also the ratio of the modulus of elasticity to density. Tables include a list of moduli of the elements in order of their increasing magnitude, and with this the best value available for Poisson's ratio. A second list indicates the nature of the temperature coefficient of modulus for several structural alloys. (Author)

Mallory-Sharon Metals Corp., Niles, Ohio.
THE MANUFACTURE OF HEAT TREATABLE Ti6Al-4V AND Ti-2.5Al-16V TITANIUM SHEET, by Paul E. Moorhead. Bi-monthly progress rept. no. 9, 25 Nov 57-25 Jan 58, on Contract NOa(s) 56-994-c. 30 Jan 58, 29p. Rept. 4000P-70; AD-157 743.
Order from LC mi$2.70, ph$4.80 PB 147 766

The chemical analyses and mechanical properties of solution treated and of age hardened 2.5 Al-16V Ti alloy sheet are tabulated. A solution treatment temperature of 1380°F for 1/2 hr followed by water quenching gave satisfactory results. An aging temperature of 960°F (4 hr) produced higher yield and ultimate tensile strengths with lower elongations than an aging temperature of 975°F (4 hr). The effects of straining of solution treated sheet (1400°F) on the mechanical properties after aging were investigated and the results are tabulated. The hydrogen pickup of 2.5 Al-16V Ti alloy sheet during solution treatment was minimized by a ceramic coating, but the same protection was not obtained by 6 Al-4V Ti alloy sheet. The results of welding studies indicate that 2.5 Al-16V Ti alloy may yield usable mechanical properties after welding; the tension/shear ratio of age hardened sheet is nearly twice that of other Ti alloys. The mechanical properties of the 6 Al-4V Ti sheet production in the anneal condition are tabulated. Four sheets (0.040 x 48 x 96 in. nominal) of 6 Al-4V were rolled, and the rolling of sheets wider than 36 in. appears to be feasible on present mill equipment.

Massachusetts Inst. of Tech., Cambridge.
SOLID SOLUTION AND SECOND PHASE STRENGTHENING OF NICKEL ALLOYS AT HIGH AND LOW TEMPERATURES, by Regis M. N. Pelloux (Doctoral thesis) and Nicholas J. Grant. Technical rept. on Contract Nonr-1841(28). [1959] 22p. 10 refs.
Order from LC mi$2.70, ph$4.80 PB 146 032

Alloys in the systems Ni-Cr, Ni-Mo, and Ni-W, were prepared as vacuum melted alloys. Tensile tests at room temperature and stress rupture tests at 1200° and 1500°F were run for time periods to give fracture in 0.1 to 500 hours. Observations were made of solid solution and second phase strengthening or weakening, coupled with studies of ductility and the role of structure on the noted behavior patterns.

Michigan U., Ann Arbor.
THE EFFECT OF TENSILE STRESS ON DIHEDRAL ANGLES IN LEADED COPPER, by C. A. Stickels and E. E. Hucke. Rept. on Contract AF 49(638)422. 31 Mar 60, 29p. 8 refs. AFOSR-TN-60-385.
Order from LC mi$2.70, ph$4.80 PB 147 004

Experiments were conducted to determine the effect of applied stress on dihedral angles of liquid lead in copper at 900°F. It was found that dihedral angles decrease with increasing stress in the center of test specimens, but that no apparent relation exists between the amount of stress applied and the dihedral angle observed nearer the surface of the specimen. The latter phenomena is attributed to oxygen penetration which changes angles by adsorption on interfaces. It was observed that stress levels resulting in specimen fracture were accompanied by migration of lead to the specimen surface and the fracture surface. A mechanism for this movement is postulated. (Author)

[Naval Engineering Experiment Station] Annapolis, Md.
SEA WATER CORROSION TEST OF STAINLESS STEEL AND NICKEL BASE ALLOY CONDENSER TUBES, by F. Sutton. 5 Jan 59, 12p. 3 refs. Research and Development Rept. 910027B; AD-214 445.
Order from LC mi$2.40, ph$3.30 PB 147 380

Plain condenser tubes of austenitic stainless steels and nickel base alloys were tested at the Harbor Island Test Station in two model condensers of 20 tubes each. Natural sea water was pumped through the tubes at a velocity of 10 ft/sec. The condensers were operated on a 30-day "off-on" cycle during part of the test. All of the stainless steels were susceptible to pitting. Type 347 was damaged most, and Type 316 the least of the steels tested. There were no failures or serious deterioration of the nickel base alloy tubes. A Ni-CR-Fe alloy was the least affected of the nickel alloys. (Author)

CORROSION (TEN YEAR BIBLIOGRAPHY). Dec 59, 39p. 1004 refs. OTS Selective Bibliography 401.
Order from OTS $0.10 OTS SB-401

A bibliography of reports listed in the two OTS monthly abstract journals: U. S. Government Research Reports and Technical Translations. The information is arranged in groupings of PB reports, AEC reports, and translations in sections as follows: corrosion resistant coatings, corrosion resistant materials, stress corrosion, corrosion tests and testing equipment, and corrosion, general, including galvanic corrosion, corrosive effects of materials, etc.

Rock Island Arsenal Labs., Ill.
AN EVALUATION OF VOLATILE CORROSION INHIBITED OILS FOR THE INTERNAL PRESERVATION OF MACHINE TOOLS IN UNCONTROLLED STORAGE, by Robert E. Johnson. 13 Nov 59, 24p. 7 refs. Rept. no. 59-2929. AD-232 438L.
Order from LC mi$2.70, ph$4.80 PB 146 838

After two years in uncontrolled storage, five volatile corrosion inhibited (VCI) oils and three grades of conventional preservative oil were evaluated to determine their comparative protective ability for the internal protection of machine tools. It was found that MIL-C-14201A Grade 1 material was most suitable for the external preservation of machine tools in uncontrolled storage.

Uppsala U. (Sweden).
THE CRYSTAL STRUCTURE OF Pd_3Si, by B. Aronsson and Anna Nylund. Technical note no. 9 on Contract AF 61(052)40. 7 Jan 60, 17p. 19 refs. AFOSR-TN-59-1269; AD-233 277.
Order from LC mi$2.40, ph$3.30 PB 146 129

The crystal structure of Pd_3Si has been established from single crystal data. The space-group is $Pnma$, and there are four formula units in the elementary cell which has the dimensions $a = 5.735$ Å, $b = 7.55$Å, and $c = 5.260$ Å. The twelve palladium atoms are situated in 8 (d) ($x = 0.1810$, $y = 0.0508$, $z = 0.3217$) and 4 (c) ($x = 0.0053$, $z = 0.9036$) positions, and the silicon atoms occupy a 4 (c) position ($x = 0.897_6$, $z = 0.469_9$). Pd_3Si, thus, crystallizes in the cementite (DO_{11}) structure. The atomic arrangement in Pd_3Si is compared with those in isomorphous phases. (Author)

EFFECT OF COLD REDUCTION ON THE MECHANICAL PROPERTIES OF HEAT-TREATED Ti-6Al-4V ALLOY, by Eric B. Kula and Frank R. Larson. Apr 58, 23p. 4 refs. Technical rept. WAL TR 401/296; AD-157 805.
Order from LC mi$2.70, ph$4.80 PB 147 159

The effect on mechanical properties of cold reduction after solution treating and prior to aging was studied in a heat of Ti-6Al-4V alloy. Solution temperatures of 1700 and 1850°F for one-half hour were used, followed by four-hour aging treatments at 850 and 950°F. Cold reductions up to 41 percent for the 1700°F material and 62 percent for the 1850°F material were affected by swaging. The yield and ultimate tensile strengths are increased by deformation even after aging. In most cases, deformation also improves the tensile ductility although there may be a reduction in the impact strength. After solution treating at 1850°F, swaging 62 percent, and then aging, the ultimate tensile strength was 215,000 psi, the 0.1 percent yield strength 205,000 psi; and the reduction in area 28 to 37 percent. (Author)

THE RECRYSTALLIZATION TEMPERATURE OF IRON AS AFFECTED BY DILUTE TRANSITIONAL ELEMENTS, by E. P. Abrahamson, II and B. S. Blakeney, Jr. Jan 60, 15p. 3 refs. WAL TR 830. 3/1; AD-231 890
Order from LC mi$2.40, ph$3.30 PB 146 827

All of the transition elements raise the recrystallization temperature of iron. In the majority of the systems, the initial effect occurs at 0.10 atomic percent or less. All changes in rates of recrystallization temperature with added elements occur within the region of solid solubility. There is a correlation between the rate of change of recrystallization temperature with atomic percent second element and the electron configuration of the second element in the ground state. (a) Atoms with like outer electron shells behave similarly. (b) For atoms having a similar number of d-shell electrons, the fewer the s-shell electrons, the greater the effect. (c) The greater the number of filled inner electron shells, for a like outer configuration, the greater the change in properties. (Author)

ULTRASONIC DETERMINATION OF ELASTIC CONSTANTS AT ROOM AND LOW TEMPERATURES, by Norbert H. Fahey. Apr 60, 14p. 4 refs. Technical rept. no. WAL TR 118. 1/1.
Order from OTS $0.50 PB 161 514

Using ultrasonics, certain elastic properties of materials can be determined in a nondestructive test, which means that tests can be conducted on a finished product. With a machine which operates within the range of frequencies of 1-9 megacycles, bulk, shear and elastic moduli and Poisson's ratio can be determined. Tests were conducted at temperatures ranging from room to -452°F on steel, aluminum, molybdenum, magnesium, lead, Inconel, chromium, Monel, tantalum, columbium, brass, bronze, copper, carbon, plastic, and three titanium alloys. Some of the materials did not lend themselves to the test, due either to their microstructure or to the frequency range of the equipment. For the materials investigated, as the testing temperature decreased, the elastic and shear moduli increased, and Poisson's ratio decreased. Bulk modulus remained essentially constant. The effects of specimen size and shape, machining finishes, bonding agents, etc., are also discussed. (Author)

Westinghouse Research Labs., Pittsburgh, Pa.
OXIDATION OF TUNGSTEN AND TUNGSTEN BASED ALLOYS, by E. A. Gulbransen, K. F. Andrew and others. Rept. for 1 May 58-15 Aug 59 on Metallic Materials, Contract AF 33(616)5770. Feb 60, 86p. 48 refs. WADC Technical rept. 59-575.
Order from OTS $2.25 PB 161 718

This report describes work on a fundamental study of the oxidation of tungsten and its alloys. To understand the tungsten-oxygen system thermodynamic measurements were made on the oxides WO_3, $WO_{2.9}$ and $WO_{2.72}$. The $W_3O_9(g)$ pressures over the solid oxide phases from WO_3 to WO_2 was measured and the homogeneity range of the several oxide phases determined. Kinetic studies were made on sheet and wire specimens from 500°C to 1300°C and for a broad pressure range. Crystal structure studies and photographic studies were made on the oxide scales. All the results suggest that the mechanism of oxidation is very complex. At 500°C and lower the reaction is probably diffusion controlled. Above 600°C localized edge type of reaction adds a complication. Above 1200°C the oxidation reaction is similiar to the combustion of graphite. The rate of oxidation is limited by the access of oxygen to the surface. (Author)

ISOTOPE EFFECTS IN HIGH RESOLUTION NMR SPECTROSCOPY, by H. S. Gutowsky. Technical rept. no. 18 on Contract Nonr-1834(13). 6 May 59, 6p. 8 refs. AD-219 836.
Order from LC mi$1.80, ph$1.80 PB 146 449

Fluorine resonance in the CF_2D group of n-C_3F_7D is shifted upfield by $0.60 \pm 0.05 \times 10^{-6}$ from that in the parent compound, n-C_3F_7H, while there is a smaller upfield proton shift for the CH_2D group in OCH_2D of $0.015 \pm 0.002 \times 10^{-6}$ with respect to CH_3 in OCH_3. Proton shifts of the same magnitude have been noted in several pairs of compounds. The main purpose of this note is to suggest that the differences in vibrational amplitudes of D and H atoms are the primary cause of such isotopic shifts.

ON THE REPRESENTATION OF THE SOLUTIONS OF THE RESTRICTED PROBLEM OF THREE BODIES BY POWER-SERIES, by Richard Schulz-Arenstorff. 30 Mar 59, 31p. 3 refs. Rept. no. DC-TR-1-59; AD-213 701.
Order from LC mi$3.00, ph$6.30 PB 145 966

The problem considered consists of the description of the solutions of the equations of motion for a particle with mass zero under the gravitational attraction of two positive masses, which revolve in plane circles around their center of gravity. This is nearly the situation for a lunar probe flight.

Cambridge U. (Gt. Brit.)
PHYSICAL LIMITATIONS TO DISPERSION RELATIONS, by John G. Taylor. Technical scientific note no. 3 on Contract AF 61(052)233. Jan 60, 27p. 20 refs. AFOSR-TN-60-276.
Order from LC mi$2.70, ph$4.80 PB 146 443

Limitations to the validity of dispersion relations arising in the general proof of these relations is discussed by considering fourth order perturbation theory. The exchange scattering of equal mass bosons or nucleons gives a limitation to the general proof, but closer analysis shows this limitation can be removed. The direct scattering term gives no limitation when anomalous thresholds are absent, but when they are present shows that the general proof cannot be applied to this case. A direct analysis in this latter case shows that the dispersion relations are not violated for any momentum transfer, though the two-dimensional representation is. (Author)

THE MASS OF THE Λ^o HYPERON, by Edward Byerly Brucker. Thesis. Rept. on Contract AF 19(603)143. Jan 60, 81p. 60 refs. AFOSR-TN-60-72.
Order from LC mi$4.80, ph$13.80 PB 146 927

The mass of the Λ^o -hyperon was determined in nuclear emulsion from the range and the relative orientation of the decay particles of twenty-five Λ^o decays. The new determination resulted in a Λ^o mass of 1115.55 ± 0.15 Mev, which corresponded to a Q-value of 37.71 ± 0.14 Mev. This new Q-value averaged with that of Barkas yielded a binding energy for ΛH^3 of $+0.12 \pm 0.26$ Mev. The density and thicknesses of the pellicles of the emulsion stack were accurately determined using, respectively, Archimedes' principle and a dial indicator.

Washington U., St. Louis, Mo.
A MEASUREMENT OF THE LONGITUDINAL POLARIZATION OF Pr^{144} BETA-PARTICLES, by Werner Alfred Wilhelm Mehlhop. Doctoral thesis. Technical rept. no. 26 on Contract AF 18(603)108. 22 Feb 60, 112p. 46 refs. AFOSR-TN-59-1323.
Order from LC mi$6.00, ph$18.30 PB 147 144

A precision determination of the longitudinal polarization of the beta particles from radioactive Pr^{144} is reported. The polarization sensitive process utilized in this experiment is Møller-scattering, i.e. the scattering of free electrons by free electrons. A major feature of the apparatus is the detection of the two final state electrons (the original one and the one knocked out of the foil) in fast coincidence; this technique, necessary to distinguish the relatively scarce Møller-events from the hugh background of nuclear scatterings, at the same time discriminates against various undesired scatterings off chamber walls etc., all these scatterings being non-coincident. The thesis contains a thorough discussion of the two nuclei under investigation (Pr^{144} and the reference nucleus Y^{90}), especially from the point of view of small theoretical corrections potentially altering the simple $\frac{v}{c}$ - dependence of the polarization.

Army Signal Research and Development Lab., Fort Monmouth, N. J.
IRRADIATION OF SEMIRAD AT THE GENERAL ATOMIC LINEAR ACCELERATOR (LINAC), 5 MAY 1959, by Stanley Kronenberg and Harry M. Murphy, Jr. 1 Sep 59, 17p. 2 refs. USASRDL Technical rept. 2070; AD-226 991.
Order from LC mi$2.40, ph$3.30 PB 146 787

Semirad instruments were irradiated with short bursts of gamma radiation at the linear electron accelerator (LINAC), General Dynamics Corp., San Diego, Calif. The purpose of the experiment was to determine Semirad response to radiation pulses of less than 10-μsec duration. Semirad instruments were exposed to the LINAC radiation source, and signals from the Semirad were transmitted to a triggered oscilloscope and the traces photographed. The Semirad response demonstrated that the time resolution was on the order of 10 μsec or less. An interesting side effect was observed, viz., secondary-electron energies of >300v were noted. These high-energy secondary electrons are as yet unexplained. (Author)

Convair, Fort Worth, Tex.
CONVAIR REMOTE-AREA FAST-NEUTRON MONITOR, by A. H. Smith. Rept. on Contract AF [33](600)32054. 4 Aug 58, 30p. NARF 58-30T; MR-N-182; AD-201 127.
Order from LC mi$2.70, ph$4.80 PB 147 596

A multichannel system of remotely operated, fast neutron detectors for dose rate measurements to 20 rem/hr in the energy range from 0.1 to 10 Mev is described. The application of this system in health physics monitoring of neutron dose rates in reactor operation areas is discussed. A general description of the electronic system is followed by a detailed consideration of the system broken down into its functional units: a detector preamplifier, linear amplifier, pulse shaping network, digital-to-analog conversion network, differences amplifier and dose rate recorder. (Author)

Maryland U., College Park.
FINAL PROGRESS REPORT. Rept. for 24 Feb 50-31 Dec 58 on Contract NObsr-49066. [1958] 8p. AD-216 000.
Order from LC mi$1.80, ph$1.80 PB 147 369

The two general phases of work on halogen counters are reported: exploration and application. An outline of the accomplishments of the first phase is included. The second phase has been devoted to the construction of geiger counters and is summarized under the following categories: U. S. Patent Application no. 666, 831; all glass vacuum gauge; the use of chlorine 36 to study the action of chlorine gas in contact with various metal and glass surfaces; and the construction of some counters from the standpoint of obtaining a high degree of stability.

Naval Radiological Defense Lab., San Francisco, Calif.
AN ALPHA SURVEY RADIAC FOR FIELD USE, by K. Sinclair and G. Kiyoi. 14 May 59, 32p. 9 refs. Research and development technical rept. USNRDL-TR-326; AD-218 286.
Order from LC mi$3.00, ph$6.30 PB 147 376

An alpha survey radiac employing a photomultiplier tube and scintillation detector was developed. The instrument utilizes transistor circuitry and operates from 2 standard flashlight batteries. Four linear ranges are provided with full scale indication on the highest range corresponding to 10,000 $\mu g/m^2 Pu^{239}$. The instrument was designed with a separable probe and a telescoping extension for easier ground monitoring. A thorium metal source is attached to the instrument housing for checking instrument calibration in the field. The device conforms satisfactorily to the military requirements for altitude, humidity, vibration, shock, and storage. The operational battery life is in excess of 40 hours. Instrument error at low temperatures slightly exceeds the ±20% accuracy requirement; however, adequate measurements are readily made by using the thorium check source to provide a check point. Instrument response to low energy X-rays is excessive. However, tests indicate that a simple lead filter will eliminate this difficulty. (Author)

Naval Radiological Defense Lab., San Francisco, Calif.
A FLAME PHOTOMETRIC APPARATUS FOR THE DETERMINATION OF RADIOACTIVE MATERIALS, by M. Honma. 24 Apr 56, 11p. 6 refs. Research and Development technical rept. USNRDL-TR-83; AD-99 256.
Order from LC mi$2.40, ph$3.30 PB 147 015

Quantitative determinations with the flame photometer are generally carried out without regard to the combustion products. The gases and particulate matter evolved from the combustion are usually allowed to diffuse into the room. At best, if the oxidation products are thought to be harmful the flame photometer is operated in an efficient hood. However, when radioactive solutions have to be analyzed by the flame photometer they cannot be run under ordinary circumstances. Since health hazards and spatial contamination are prime considerations when running these solutions, provisions must be made so that the radioactive particles can be contained and controlled. A triple-filter apparatus has been devised to be used with the flame photometer in which the radioactive particles are filtered out before the exhaust gases are discharged. The operational techniques for the apparatus are discussed. A table showing the contamination of the various parts of the apparatus after an 80-hr run is presented. (Author)

Naval Radiological Defense Lab., San Francisco, Calif.
A LOW RANGE BETA-GAMMA SURVEY METER, by M. H. Eklund and G. A. Work. 3 Feb 58, 54p. 5 refs. Research and Development technical rept. USNRDL-TR-255; AD-205 624.
Order from LC mi$3.60, ph$9.30 PB 147 377

A low range beta-gamma survey meter employing halogen-quenched G-M tubes and transistor circuitry has been developed. The instrument measures gamma radiation from 0 - 500 mr/hr in four linear ranges and provides beta indication on all ranges. The instrument has been conservatively designed to meet military specifications. A transistor oscillator converts battery voltage to regulated high and low voltages, giving more than 400 hours of operation with two easily obtainable flashlight cells. The use of a corona regulator has been avoided. The rate-meter is an advanced zero-stable diode pump circuit requiring no pulse-width range switching. The survey meter has been packaged in a form providing easy handling with one-hand operation for some monitoring applications. The instrument is also alpha sensitive, reading an equivalent 2 mr/hr in contact with a plutonium source of 5.10^{-3} micro-curies/cm^2. (Author)

Radiation Effects Information Center, Battelle Memorial Inst., Columbus, Ohio.
A SURVEY OF CURRENT RESEARCH AND DEVELOPMENTS IN THE FIELD OF DOSIMETRY (FIRST ADDENDUM) by Mary J. Oestmann and J. F. Kircher. Rept. on Contract AF 33(616)5171. 31 Mar 59, 21p. 40 refs. REIC rept. no. 6 (Addendum); AD-210 766.
Order from LC mi$2.70, ph$4.80 PB 147 104

This is the first addendum to the REIC Report No. 6 "A Survey of Current Research and Developments in the Field of Dosimetry" Very few new dosimeter concepts have been reported during the past year. Advances made during 1958 consist primarily of refinements of the previously established dosimeter systems. Investigations have involved reaction mechanisms and the determination of more accurate G-values. An appropriate choice of materials has helped to extend the useful range of some dosimeters. Standard foils and methods of measurement of these foils are being developed for neutron dosimetry. Further details on any one system may be found from the extensive bibliography provided. (Author) (See also PB 151 571)

Nuclear Engineering and Power

Army Chemical Warfare Labs., Army Chemical Center, Md.
THE FEASIBILITY OF REDUCING THE COST OF DISPOSAL OF REACTOR WASTES BY USING FISSION PRODUCTS AS HEAT SOURCES, by Luther M. Hardin and Robert P. Beckelheimer. Nov 59, 50p. 26 refs. CWLR 2307; AD-229 969.
Order from LC mi$3.30, ph$7.80 PB 146 757

Predictions and calculations are presented for (1) the rate of growth of the nuclear-power industry, (2) the total fission-product power per unit reactor power (3) the useful fission-product heat output per unit reactor power, (4) the useful heat output from all the fission products resulting from the nuclear power industry during the period 1960 to 1980. Costs involved in the production of heat are compared with the value of the heat produced. (Author)

Wright Air Development [Div.] Wright-Patterson AFB, Ohio.
SOME NEW TYPES OF NEUTRON-SHIELDING MATERIALS, by Anthony N. Fasano. Research conducted at Brookhaven National Labs. June 59, 7p. WADC Technical note 59-227.
Order from OTS $0.50 PB 161 308

Materials having high neutron-absorption cross sections are needed for protecting gamma and neutron detectors from thermal-neutron damage and to form collimators for beams of neutrons. Boron or lithium, as the powdery compounds B_4C and LiF, could absorb the neutrons, but as powders are impossible to apply or form into protective shields. Processes were developed using inexpensive plastic, paraffin, and linseed oil as bonds and G.E. thinner, Saurizen thinner, trichlorethylene, and turpentine as solvents to produce materials that can be molded, formed, cast, rolled, or painted as a protective shielding or coating. Methods were devised for reclaiming the expensive boron and lithium compounds. (Author)

Naval Research Lab., Washington, D. C.
A STUDY OF PHOTONS IN SODIUM IODIDE SCINTILLATION CRYSTALS, by Charlotte M. Davisson and L. A. Beach. Final rept. 31 Dec 59, 75p. 23 refs. NRL rept. 5408.
Order from LC mi$4.50, ph$12.30 PB 146 030

Using Monte Carlo methods coded for computation by the Narec digital computer, a study has been made of the interactions within NaI(Tl) crystals of photons incident along the center axis of cylindrical crystals. Incident energies studied were 0.3, 0.5, 0.7, 1.0, 1.2, and 1.5 Mev, and crystal sizes ranged from 1 in. diameter by 1 in. long to 5 in. diameter by 8 in. long. Pair production was included only as an absorption,

and the results were not modified by any response function of counting and recording instruments. The results are presented in a way that shows the variation with incident energy, with crystal diameter, and with crystal length of the following: (a) histogram distributions of the energy given to the crystal by the photons, (b) photoefficiencies, (c) photofractions, (d) number of collisions within the crystals, and (e) the geometrical distribution of the emerging, scattered photons. Constants for an empirical equation for photofractions as a function of incident energy dimensions were obtained from the results and can be used to estimate photofractions for any incident energy and crystal size in the ranges studied. (Author)

Sarah Mellon Scaife Radiation Lab., U. of Pittsburgh, Pa.
STUDY OF SOME REACTIONS OF 15 MEV DEUTERONS WITH THE LITHIUM ISOTOPES, by Ernst Wolfgang Hamburger. Doctoral thesis. Technical rept. no. 12 on Precision Scattering of Nuclear Particles, Contract N7onr-32505. Apr 59, 132p. 47 refs.
Order from LC mi$6.90, ph$21.30 PB 146 035

Metallic targets of enriched Li^6 and Li^7 were bombarded with 15 Mev deuterons. The results of the (d, p),(d,t) and (d,He^3) reactions were compared with stripping theory and with the predictions of the shell model. The agreement is, in general, satisfactory.

Radioactivity

Army Chemical Warfare Labs., Army Chemical Center, Md.
A PORTABLE REMOTELY OPERATED DEVICE FOR PRODUCING A GAMMA RADIATION FIELD, by Ralph E. Rexroad and Murray A. Schmoke. Dec 59, 21p. 2 refs. CWL Special Pub. 3-8; AD-231 042.
Order from LC mi$2.70, ph$4.80 PB 146 857

A portable field device is described for lifting a high-intensity gamma radiation source from its shield without exposing the personnel involved to harmful radiation. The device raises the radioactive source from its steel-jacketed lead shield by air pressure. High-level radiation fields can be produced with this system with very little exposure of test personnel to radiation.

Institute of Engineering Research, U. of California, Berkeley.
ON THE SMALL-SCALE NON-HOMOGENEITY OF FALLOUT DEPOSITION, by G. M. Corcos. Rept. on Contract CD-SR-58-40. 30 Oct 58, 54p. 11 refs. Series no. 2, issue no. 2; OCDM-UCAL-2-2-58.
Order from LC mi$3.60, ph$9.40 PB 147 391

The main contributions of the present report are to provide a guide to the testing of fallout deposition and to adduce evidence that inhomogeneous depositions should be expected, mostly through the larger particles.

Naval Radiological Defense Lab., San Francisco, Calif.
ANALYSIS OF RADIOLOGICAL DECONTAMINATION DATA OBTAINED FROM FIELD TESTS, by C. F. Miller. 3 Apr 59, 86p. 7 refs. Research and development technical rept. USNRDL-TR-321; AD-219 720.
Order from LC mi$4.80, ph$13.80 PB 147 379

Reclamation data from Operation Plumbbob are used to illustrate a method of treating and analyzing such data obtained in field-test experiments. The method utilizes available radiation-scattering computations to estimate the contribution of radiation sources outside reclaimed areas to the radiation field inside the areas. These contributions are then subtracted to determine a more accurate value of the true effectiveness of the reclamation procedure of procedures. (Author)

Naval Radiological Defense Lab., San Francisco, Calif.
GAMMA DECAY OF FISSION PRODUCTS FROM THE SLOW-NEUTRON FISSION OF U^{235}, by Carl F. Miller. 11 July 57, 106p. Research and Development technical rept. USNRDL-TR-187; AD-147 420.
Order from LC mi$5.70, ph$16.80 PB 147 393

Photon energy radiation rates and photon emission rates from the fission products produced by slow-neutron bombardment of U^{235} are computed, using nuclear decay scheme data and the results of new computations for the gross activity in terms of disintegration rate. The computed rates were used to determine, as a function of time after fission, the mean photon energy per disintegration, and the number of beta rays per photon. Curves showing photon energy radiation rates, photon emission rates, and beta rates for a time range of about 46 minutes to about 300 years after fission are presented. A comparison is made of activity and the computed photon energy radiation rates for 1 hr to 3 years after fission. The computed decay curves for 10^4 fissions from slow-neutron fission of U^{235} using the USNRDL 4-pi Ionization Chamber is presented. (Author)

Naval Radiological Defense Lab., San Francisco, California.
PHYSICAL, CHEMICAL, AND RADIOLOGICAL PROPERTIES OF SLURRY PARTICULATE FALLOUT COLLECTED DURING OPERATION REDWING, by N. H. Farlow and W. R. Schell. 5 May 57, 17p. 7 refs. Research and Development Technical rept. USNRDL-TR-170; AD-145 733.
Order from LC mi$2.40, ph$3.30 PB 147 381

The properties of individual fallout particles produced by nuclear detonations at zero height over shallow sea water are analytically described for the first time. The particles produced during Operation REDWING were slurry masses composed of water, dissolved and crystalline sea salts, and seawater-insoluble solids from the weapon, barge, and ocean floor. Special techniques were used to measure the chloride, water, and insoluble-solids content of individual slurry particles. Autoradiography showed that the activity is primarily associated with the solids. A table of

experimental data presents particle size versus time of arrival after detonation as well as measurements of particle density and relative specific activity. Estimates of mass and relative activity of fallout per unit area for certain locations about the shot point are shown. (Author)

Naval Research Lab., Washington, D. C.
A STANDARD SOURCE OF RADIATION FOR RADIAC DETECTORS. PART II. EXTENSION OF THE RANGE OF EXPOSURE-DOSE RATES AND THE NEW Cs-137 SOURCE, by A. E. Nash and W. E. Kunz. 22 Apr 60, 14p. 8 refs. NRL rept. 5462.
Order from LC mi$2.40, ph$3.30 PB 145 058

Four facilities of similar design to produce standard gamma-ray fields have been constructed and calibrated for use with cobalt-60 and cesium-137 sources. These facilities provide four intensity ranges, two of which, the low and the medium ranges (the medium range was formerly called the high range), have previously been described and calibrated. The low range covers the region between background and 0.5 r/hr using interchangeable sources of Co-60, Cs-137, and Ra. The medium range, using Co-60, extends the field to 50 r/hr. The two new higher ranges extend the exposure-dose rate for the Co-60 source (150 curies) in one case and introduce a new source of Cs-137 (100 curies) in the other. The range of calibrated gamma-ray intensity now includes the region from background to over 2000 r/hr for Co-60 and to 800 r/hr for Cs-137. In addition to the calibration of the two new facilities, the older medium range has been recalibrated using a carbon ionization chamber, for which a calibration procedure has been adapted from a standard procedure. The two new sources are being used in conjunction with the new 300-kev x-ray facility to provide energy calibration points for energy-dependence measurements. (Author)

MAGNETIC SHOES FOR HUMAN ORIENTATION IN SPACE, by J. F. Nicholson and D. W. Naas. Rept. on Solid State Research and Properties of Matter. Feb 60, 12p. 6 refs. WADC TN-59-352.
Order from OTS $0.50 PB 161 727

This report describes both permanent and electromagnetic shoes for human orientation in a weightless environment. The electromagnetic shoes operate on a low voltage power source which may be adjusted to the individual requirements of the wearer. A microswitch which interrupts the magnetic circuit each time the heel is raised reduces walking fatigue and increases the operational life of the batteries. An inertia switch is included in the magnetic circuit as a safety device. When the switch senses any sudden acceleration or deceleration, it shunts the potentiometer and allows additional current to flow to the electromagnet thereby increasing the holding force. (Author)

PONCHO, LIGHTWEIGHT, OD, W/HOOD (PROTECTIVE), FINAL DEVELOPMENT AND ENGINEERING TEST OF, by S. J. Shurtleff. July 58, 26p. 10 refs. Technical rept. CP-8.
Order from LC mi$2.70, ph$4.80 PB 138 275

Military characteristics for protective clothing and equipment require that the items be non-flammable, protective against thermal and CBR agents, and that present standard items of field clothing be considered in meeting these objectives. The protective poncho described represents progress made by the Quartermaster Corps to meet these combined requirements. The protective poncho is made in the same design as the standard vinyl-coated poncho, but is fabricated of a neoprene-coated Fortisan fabric.

TROPICAL DETERIORATION OF EQUIPMENT AND MATERIALS. Summary technical rept. vol. 1, Contract OEMsr-1131. 1946, 100p. 89 refs.
Order from LC mi$5.40, ph$15.30 PB 139 781

Contents:
Organisms associated with tropical deterioration
Prevention of deterioration of optical instruments
Tropical deterioration of textiles
The problem of fungal growth on synthetic resins, plastics, and plasticizers
Tropical deterioration of photographic equipment and supplies
Tropical deterioration of electric and electronic equipment
Coordination of test methods
Results of testing materials under tropical conditions
Recommendations for future work

DIFFRACTION BY AN ELLIPTIC CONE, by Lester Kraus and Leo M. Levine. Rept. on Contract AF 19(604)5238. Mar 60, 32p. 11 refs. Research rept. no. EM-156; AFCRC-TN-60-195.
Order from LC mi$3.00, ph$6.30 PB 147 527

The boundary value problems corresponding to a spherical wave incident on an acoustically soft or hard elliptic cone, or plane angular sector, are solved. The method of separation of variables in a sphero-conal coordinate system is used. The special functions which arise are simply periodic and nonperiodic solutions of the Lame differential equation. RESEARCH ON EFFECTS OF NUCLEAR RADIATION ON MAGNETIC AND DIELECTRIC MATERIALS: INSTRUMENTATION, by S. I. Taimuty, C. A. Rosen and others. Scientific rept. no. 3 on Contract AF 19(604)4141. 10 Nov 59, 23p. 8 refs. AFCRC-TN-59-990; AD-232 109.
Order from LC mi$2.40, ph$7.80 PB 145 970

As the first part of a project to study the effect of nuclear radiation on magnetic and dielectric materials, three instruments have been developed to measure radiation-induced changes in the properties of magnetic and ferroelectric materials. One is a magnetic hysteresigraph for recording hysteresis loops in toroidal magnetic samples at frequencies of 400 cps to 100 kcps. The second is an apparatus employing a bridge technique for small-signal magnetic permeability measurements at frequencies of 15-640 kcps. The third is a ferroelectric hysteresigraph for recording hysteresis loops in ferroelectric materials at frequencies of 60-10,000 cps. (Author) (See also PB 161 115)

THE NOISE FIELD OF A SUBSONIC JET, by Gino Moretti and Simon Slutsky. Rept. on Contract AF 49(638)194. Nov 59 169p. 8 refs. GASL Technical rept. no. 150; AFOSR-TN-59-1310.
Order from LC mi$7.80, ph$25.80 PB 147 321

The acoustic far field of a singularity is investigated under several different conditions of the medium. The simple cases of a source in an infinite wind, as observed at a fixed or a moving point, are analyzed to permit comparison with physical systems of practical interest, e.g., jet engine fly-by noise analysis. Widespread misunderstanding of the Lighthill Mach number dependence has been noted and clarified by means of the above analysis. The far field of a singularity imbedded in a jet has been determined as a function of jet velocity and temperature distribution with special emphasis on the case of uniform distribution in the jet. Comparison of experimental results is made and fair agreement noted. Factors involved in failure to obtain complete agreement are discussed. (Author)

EXPERIMENTS RELATING TO THE INTERACTION OF SOUND AND TURBULENCE, by Dieter W. Schmidt. Rept. for 1 Dec 58-30 Nov 59 on Contract AF 61(514)1143. [1960] 20p. 6 refs. AFOSR-TN-60-347.
Order from LC mi$2.40, ph$3.30 PB 147 110

The paper gives some new experimental results about the scattering of sound by a turbulent flow. The dependence of the scattering on the frequency of sound and on the direction of the scattering vortices was investigated. In both cases good agreement was obtained between the measurements and theoretical predictions. Additionally, some equipment is described which facilitates the use of hot-wires for the measuring of turbulence. Especially, design characteristics of an apparatus are given, by which hot-wire probes can be rewired precisely and quickly. (Author)

INTERLEAVED-PLATE ELECTRODYNAMIC TRANSDUCER. PART 1. STATIC THRUST ANALYSIS, by Burwell Goode. 11 Dec 58, 11p. 1 ref. Research and Development rept. 883; AD-214 347.
Order from LC mi$2.40, ph$3.30 PB 146 977

An electrodynamic transducer has been designed to serve as a broadband low-frequency underwater sound source, putting a reasonable amount of power into the water for the range 20 to 2000 cps. It is a camera-size, twin-piston transducer, with parallel plates of copper or aluminum windings, separated by silicon iron strips, serving as driving components. A thrust formula was derived and compared with the experimental values of a pilot model. The vibrator can deliver 200 pounds of rms thrust for pulse operation. (Author)

THE EVALUATION OF SURFACE REVERBERATION IN SONAR, by J. Warren Horton. 4 Mar 59, 19p. 22 refs. USL Research rept. no. 422; AD-217 108.
Order from LC mi$2.40, ph$3.30 PB 147 378

A significant factor affecting the magnitude of the acoustic energy returned to a source point in the ocean as a result of back-scattering from the ocean surface is the coefficient by which to multiply the incident intensity at a scattering point to obtain the surface area derivative of the intensity of the scattered energy, as measured at unit distance from this point. This scattering coefficient is a function of the angle between the path by which energy reaches and leaves the scattering surface and this surface. To compute the apparent plane wave intensity of the energy returned to the source point, at any instant, it is necessary to evaluate the derivative of the free-field intensity of this energy with respect to area of scattering surface. This derivative is a function of (1) the scattering coefficient, (2) the propagation factor applying to the path between source point and scattering point, (3) the relative transmitting and receiving responses of the transducer applying to this path, and (4) the index intensity of the transmitted energy pulse. The value of the integrand appearing in the expression for the intensity of the received energy may be measured, as a function of time, by observing the rate of change of this energy with change in pulse length. Since all factors in this integrand except the scattering coefficient may be evaluated, this coefficient may be determined. This method is theoretically ideal and operationally practical. (Author)

MUTUAL RADIATION IMPEDANCE BETWEEN PISTONS ON SPHERES AND CYLINDERS, by Carles H. Sherman. 24 Nov 58, 32p. 24 refs. USL Research rept. no. 405; AD-207 686.
Order from LC mi$3.00, ph$6.30 PB 147 382

Determination of the mutual radiation impedance coefficient is shown to be the essential part of the acoustic radiation problem for an array of interaction pistons. Expressions for this coefficient are derived in the cases of circular and rectangular pistons on a rigid sphere and rectangular pistons on an infinite, rigid cylinder. Numerical data showing the real and imaginary parts of this coefficient as a function of the separation between circular pistons on a sphere are presented for several values of ka. (Author)

THE REMANENCE OF ALNICO V AND VI MAGNETS BETWEEN ROOM TEMPERATURE AND 550°C, by Rudolf K. Tenzer. Rept. for Nov 55-Aug 59 on Magnetic Materials, Contract AF 33(616)3385. Jan 60, 21p. 2 refs. WADC Technical rept. 59-438.
Order from OTS $0.75 PB 161 708

Because Alnico V and VI magnets have been found suited for use at temperatures up to 550°C, the behavior of remanence in such magnets was studied closely at elevated temperatures. Temperature effects on the remanence of a magnet are clearly classified and defined: (a) reversible (b) irreversible and (c) effects due to changes in the material. These effects were determined on Alnico V and VI magnets at temperatures up to 570°C for periods as long as 1000 hours. Material effects of a few percent can be minimized for magnet applications between 350°C and 550°C by heat treating at the highest operating temperature for at least 24 hours. Irreversible effects can be eliminated by cycling the magnets between room temperature and the highest operating temperature. After stabilization, remanence varies less than ±1% at elevated temperatures during exposures up to 1000 hours. Reversible effects vary according to the type of material and the temperature range in which a magnet is stabilized. (Author)

National Bureau of Standards, Boulder, Colo.
DYNAMIC MEASUREMENTS OF THE MAGNETO-ELASTIC PROPERTIES OF FERRITES, by Virgil E. Bottom. [1957] 54p. 12 refs. Technical note no. 49.
Order from OTS $1.00 PB 151 408

The relations between the mechanical and magnetic properties of a ferrite are derived for the small signal or reversible condition using thermodynamic principles. The equation of motion of a ferrite ring driven in its fundamental mode is set up and solved leading to the equivalent electrical circuit of the magnetostriction resonator. From mechanical measurements of the density and dimensions of the ring and electrical and frequency measurements of the resonator, the elastic modulus, permeability, magnetostriction coefficients and loss factors in the ferrite can be determined. Apparatus is proposed for performing the above measurements. (Author)

SOUTHERN HEMISPHERE METEOR RADIANTS AND RATES. PART (a) METEOR RATES WITH CONSTANT PARAMETERS, by C. Ellyett, C. S. L. Keay and others. Scientific rept. no. 1 on Contract AF 64(500)6. 27 Oct 59, 20p. 5 refs. AFCRC-TN-59-964; AD-232 112.
Order from LC mi$2.40, ph$3.30 PB 146 131

An experiment is conducted to obtain continuous observation of all-sky radar-meteor rates over a year. This study involved a critical appraisal of all the experimental factors which can introduce spurious rate variations. Apparatus is described. Both artificial and galactic noise cause errors. A special design of receiver, using two IF channels, largely overcomes the artificial noise. The galactic noise can be overcome by a self-compensating video stage. A riometer was built to study radio noise of auroral origin, and to provide complementary data to the meteor receiver in assessing the effect of noise variation on meteor rate counts. (Author)

THE MECHANISM OF RADIO REFLECTIONS FROM METEORIC IONIZATION, by Von R. Eshleman. Technical rept. no. 49 on Contract N6onr-251, T.O. 7. 15 July 52, 137p. 46 refs. ATI-163 933.
Order from LC mi$6.90, ph$21.30 PB 146 479

The development of a theory of radio reflections from cylinders of ionization is undertaken in order to explain the characteristics of radio echoes from meteor trails. It is found that the field strength of a radio wave reflected from an ionization column is dependent upon the polarization of the incident wave with respect to the cylinder axis, the size of the column, the total number of electrons per unit of length along the column, and the radial variation of electron volume density. Two theoretical approaches to the problem are investigated. One approach is obtained by solving the electromagnetic wave equation for dielectric columns with cylindrical symmetry, while the other method consists of summing the fields scattered by the individual electrons in the column.

Lincoln Lab., Mass. Inst. of Tech., Cambridge.
THE CONDUCTANCE OF A SLOT IN AN ARRAY ANTENNA, by S. J. Rabinowitz. Rept. on Contract AF 19(122)458. 31 Dec 58, 23p. 16 refs. Technical rept. no. 192; AD-209 908.
Order from LC mi$2.70, ph$4.80 PB 146 210

The driving point impedance of an element in an array antenna is different from its value when it is isolated in free space. This difference is due to the mutual coupling between elements of the array. The conductance of a slot element in a planar array or in a linear array is found. The calculations are based on well-known antenna gain and pattern relations. Complete agreement between these values and those found by different methods results. (Author)

Naval Research Lab., Washington, D. C.
COMPARISON OF MICROWAVE AND LANGMUIR PROBE TECHNIQUES FOR THE INVESTIGATION OF ELECTRICAL DISCHARGES, by R. C. Jones, C. M. Howe, and J. L. Ahearn. Interim rept. 21 Apr 60, 20p. 11 refs. NRL rept. 5468.
Order from LC mi$2.40, ph$3.30 PB 145 350

Properties of rocket motor exhausts have been studied at NRL by propagating focused microwave energy through them. In this study, the exhaust was replaced by an electrodeless discharge. The attenuation was measured and then compared with that predicted on the basis of a given electron density and collision frequency. These parameters were arrived at by probe measurements. Agreement between the two methods fell within the range of accuracy of measurement. (Author)

HARMONICS FROM A MICROWAVE GAS DISCHARGE, by N. R. Bierrum and D. Walsh. Technical note no. 5 on Contract AF 61(514)1183. [1959] 11p. 5 refs. AFOSR-TN-60-280.
Order from LC mi$2.40, ph$3.30 PB 146 441

Harmonic power from a 10 cm. wavelength glow discharge in neon has been detected down to 6 mm wavelength (18th harmonic). The fundamental power is fed from the waveguide to a coaxial line terminated by the discharge tube. A second smaller waveguide is coupled to the coaxial line to extract the harmonic power. With careful matching at each wavelength, the conversion loss appears to fall off by only 3-4 db per harmonic after an initial drop of 35 db to the third harmonic (lowest harmonic measured). A typical conversion loss from 10 cm. to 8 mm (12th harmonic) is 63 db, e. g. 20 kW input, 10 mW output. In general the output power increases with input power until arcing in the mount spoils the measurement. A pressure range of 5-39 mm. Hg. has been used. (Author)

A STUDY OF POSTS IN CIRCULAR WAVEGUIDE, by Alfred T. Villeneuve. Final rept. for 1 Feb 56-30 May 57 on Contract AF 30(602)1507. 20 June 57, 77p. 14 refs. SURI rept. no. EE400-575F; RADC-TR-57 145; AD-131 241.
Order from LC mi$4.50, ph$12.30 PB 146 127

This report describes a study for the determination of the equivalent circuit parameters of a thin conducting post spanning the cross section of circular waveguide and the application of such posts to the polarization twist duplexer. A variational approach is applied to the equivalent circuit problem and the general problem of the equivalent circuit of obstacles in guides is discussed. No numerical results have been obtained for the equivalent circuit parameters. The problem of application of posts to the polarization twist duplexer was investigated through the use of matrix methods, but no conclusions could be drawn from such a formulation without extensive cut and try calculations.

FOUNDATIONS OF CIRCUIT ANALYSIS, by William M. Brown. Rept. on Proj. Michigan, Contract DA 36-039-sc-78801. Sep 59, 21p. 6 refs. 2900-92-R; AD-226 336.
Order from LC mi$2.70, ph$4.80 PB 146 828

A unified picture is given of operational circuit analysis through a study of its foundations. Several specific considerations are discussed as extensions of the basic theory. A feature of the development that the memorandum provides is that the existence and uniqueness of a transfer function and some of its properties are established without reference to differential equations or other detailed aspects of circuits. The role of exponentials is first studied in detail, and it is proved that exponentials and only exponentials are eigen functions for all linear, time-invariant circuits. The following three circuit properties are then considered: (1) the output at any one complex frequency depends only upon the component of the input at that frequency; (2) the circuit is linear; or (3) the circuit is time-invariant. It is shown that any two of these properties imply the other one, but that no one implies any other. A general transform which includes sinusoidal analysis, Fourier, Laplace and Stieltjes transforms as special cases is defined and discussed briefly. The topics of nonreal circuits and realizable circuits are discussed briefly. (Author)

PARAMAGNETIC AND OPTICAL SPECTRA OF YITTERBIUM IN THE CUBIC FIELD OF CALCIUM FLUORIDE, by W. Low. Technical note no. 11 on Contract AF 61(052)59. Jan 60, 8p. 7 refs. AFOSR-TN-60-308.
Order from LC mi$1.80, ph$1.80 PB 147 109

The paramagnetic resonance spectrum of Yb^{3+} in CaF_2 was observed at 20°K and 3 cms wavelength. The spectrum is described by a cubic spin Hamiltonian $\mathcal{H} = g\beta H.S. + A S.I$ with $g = 3.426 \pm 0.001$, $S = 1/2$, $A^{171} = 886.5 \pm 1.5 \times 10^{-4}$ cm^{-1}, $A^{173} = 243.2 \pm 0.4 \times 10^{-4}$ cm^{-1}, $I^{171} = 1/2$, $I^{173} = 5/2$. The ratio of magnetic moments is $\frac{\mu^{173}}{171} = 1.374_9 \pm 0.005$. The optical spectrum shows lines of 9774, 9770, 9763 A° and more diffuse and unresolved bands at 9080 and 12730 A°. The paramagnetic spectrum is explained as arising from the Γ_7 doublet. The other levels are removed by at least a few cm^{-1} leading to an isotropic g value of 3Λ or $\frac{24}{7}$ for the lowest Γ_7 level. (Author)

Hebrew U. (Israel).
PARAMAGNETIC RESONANCE SPECTRUM OF MANGANESE IN CORUNDUM, by W. Low and J. T. Suss. Technical note no. 12 on Contract AF 61(052)59. Feb 60, 7p. 12 refs. AFOSR-TN-60-423.
Order from LC mi$1.80, ph$1.80 PB 147 108

The paramagnetic resonance spectrum of Mn^{2+} in Al_2O_3 was measured at 3 cms. The spectrum can be expressed in a spin Hamiltonian with trigonal symmetry with the following parameters: $g_{\parallel} = 2.0017 \pm 0.001$, $g_{\perp} = 2.000 \pm 0.002$, $D = +194.2 \pm 1$, $a\text{-}F = +21.9 \pm 0.6$, $A = -79.6 \pm 0.5$, $B = -78.8 \pm 0.8$ in units of 10^{-4} cm^{-1}. MOLECULAR SPECTROSCOPY REPORT, 1958-1959, by W. C. Price, G. R. Wilkinson and others. Final technical rept. no. 1, 1 Nov 58-31 Oct 59 on Contract DA 91-591-EUC-969. Oct 59, 155p. 27 refs.
Order from LC mi$7.50, ph$24.30 PB 146 831

Subject of Research: (1) The infrared spectra of some ionic and molecular crystals using high resolution over wide wavelength ranges and at temperatures down to that of liquid helium. (II) The absorption spectra of different materials (in solid, liquid or gas phase) in the infrared and in the vacuum ultraviolet.

Istituto di Fisica Superiore, Universita di Pavia (Italy).
A MICROWAVE SPECTROGRAPH FOR PARAMAGNETIC RESONANCE. SOME PRELIMINARY RESULTS OBTAINED ON TWO NEW FREE RADICALS, by A. Giarda, G. Lanzi and others. Final technical rept. for Sep 58-Aug 59 on Contract DA 91-508-EUC-396. Nov 59, 22p. AD-232 704.
Order from LC mi$2.70, ph$4.80 PB 146 834

A description is given of a microwave reflection spectrograph which operates at a fixed frequency of about 9300 mc, corresponding to a wavelength of about 3 cm in vacuum. The waveguide circuit includes a resonant cavity wavemeter for frequency measurements. The branch which contains the klystron generator is equipped with a ferrite insulator to prevent reflections toward the klystron; another branch contains the attenuators and matching devices. The electromagnetic field in the microwave region is generated by a 723 A/B reflex klystron at a frequency

ot 9370 mc with an output power of 20 megawatts. The resonant cavity is mechanically tuned with a screw which acts on the upper side of the klystron. The electromagnetic field is fed into the waveguide through a small coaxial cable. The detector is a 1 N 236 silicon diode rectifier which is capable of detecting the signal (9300 mc AC voltage modulated by 70c AC voltage). Measurements were made of the line widths and spectroscopic splitting factors of the quinazoline bisulfate and phenothiazine perchlorate free radicals.

INVESTIGATION OF FAR INFRARED SPECTRA, by Richard C. Lord. Rept. for Mar 58-Aug 59 on Experimental Techniques for Materials Research, Contract AF 33(616)5578. Feb 60, 34p. 38 refs. WADC Technical rept. 59-498.
Order from OTS $1.00 PB 161 738

Applications of a small grating spectrometer to problems of molecular structure by means of infrared absorption spectra in the region 50 - 300 cm^{-1} are reviewed. Infrared spectra in the range 50 - 300 cm^{-1} are reported and discussed briefly for methyl amine, hydrazine and trimethylene oxide, and in the range 50 - 600 cm^{-1} for cyclopentane, cyclohexane, cycloheptane, cyclooctane, oxycyclopentane (tetrahydrofuran) and 1, 4-dioxycyclohexane (dioxane). Isolated low frequencies are given for thiacyclobutane, disilylacetylene and dimethyl acetylene. New values for the thermodynamic functions of hydrazine are given, and values from the literature are included for diborane and cyclobutane. (Author)

MIE SCATTERING IN THE FORWARD AREA, by R. Penndorf. Scientific rept. no. 2 on Research on Aerosol Scattering in the Infrared, Contract AF 19(604)5743. Feb 60, 91p. 18 refs. Technical rept. RAD-TR-60-10; AFCRC-TN-60-285.
Order from LC mi$5.40, ph$15.30 PB 146 907

The scattering of light is investigated from a theoretical point of view. After explaining the basic Mie formulas, several useful scattering functions are defined. The scattering pattern for the forward, sideward, and backward area is briefly described, followed by a very detailed investigation for the forward direction, which is based on all available data computed according to the Mie formulas. A wide range of refractive indices n from $n = 1.05$ to $n = 2.0$ have been selected, and all values of i_θ and p_M are extensively listed in the appendix. The behavior of these scattering coefficients is investigated and described in detail. This is followed by a careful investigation of practical limits for the Mie region, which can be defined only arbitrarily. Methods are developed for computing the scattering functions by simple means. Applications of these theoretical data are given to compute the angular Mie cross section and the volume-scattering coefficient by a graphical method. These scattering values can be derived also for given size distributions of the aerosol.

THIN FILMS WHICH PRODUCE PHOTOELECTRIC AND PHOTORESISTIVE EFFECTS, SECTION I AND II (OF FOUR SECTIONS) by Werner Beyen, Donald Bode and others. Final engineering rept. on Contract W33-038-ac-15160. 1 Apr 55, 37p. 8 refs. Physics rept. 101-35; AD-60 906.
Order from LC mi$3.00, ph$6.30 PB 146 950

Section I contains a description of apparatus and techniques for the measurement of infrared photoconducting devices, Section II contains a summary of the electrical and optical properties of PbTe films.

Willow Run Labs., U. of Michigan, Ann Arbor.
THE EFFECT OF FILM-THICKNESS VARIATIONS ON COHERENT LIGHT, by Arthur L. Ingalls. Rept. on Project Michigan, Contracts DA 36-039-sc-78801, AF 33(600)38019, and AF 30(635)2905. Oct 59, 15p. 3 refs. 2900-88-R.
Order from LC mi$2.40, ph$3.30 PB 146 829

This report describes the experiments which measured perturbations in monochromatic coherent light caused by variations in film thickness, and discusses the results. The introduction of commercial photographic film into the aperture of an optical system disturbs the coherence of the transmitted light, because of the variations in thickness and refractive index present in the film. Such variations in film may be made visible, as contour lines, by light interference pattern were measured, and calculations of light-path variations made. A qualitative analysis showed that film-base thickness-variation was primarily responsible for deterioration of coherence. Formulas are given which show the effect of film variations on coherent light for both use and measurements; and figures are included which show the distribution of film quality.

EFFECT OF Li-B ION PAIRING ON Li^+ ION DRIFT IN Si, by E. M. Pell. Scientific rept. no. 4 on Contract AF 19(604)5551. 28 Apr 60, 18p. 7 refs. AFCRC-TN-60-386.
Order from LC mi$2.40, ph$3.30 PB 147 359

When Li^+ and B^- ions are present simultaneously in Si, relatively immobile Li-B ion pairs are formed. Only those Li^+ ions which have not become paired with B^- are free to diffuse through the Si, and measurement of the effective diffusion rate of the Li^+ can thus be used to determine the fraction of Li^+ paired. Such measurements have been made in the range 0°C to 100°C using the method of ion drift in a pn junction. The results agree well with the Reiss model for ion pairing, yielding a distance of closest approach between Li^+ and B^- of 2.5 to 2.7°A. This value is larger than given by the sum of Li^+ and B^- radii; it is roughly equal to the distance from a lattice atom site to the next-nearest interstitial site (2.72 Å). The kinetics of the ion pairing reaction have been investigated by the same technique. The resulting value for the capture radius of the B^- ion agrees satisfactorily with theory. (Author)

ELECTRON MOBILITY AND SCATTERING PROCESS IN AgBr AT LOW TEMPERATURES, by Dwight C. Burnham, Frederick C. Brown, and Robert S. Knox. Technical note no. 3 on Contract AF 49(638)579. Mar 60, 48p. 41 refs. AFOSR-TN-60-419.
Order from LC mi$3.30, ph$7.80 PB 146 930

The Hall effect for electrons released by light in high-purity crystals of AgBr has been studied experimentally in the temperature range 4° to 120°K. The observed mobilities exceed 20,000 cm^2/volt-sec at very low temperatures. The general features of the dependence of low-field Hall mobility on temperature can be understood by comparison with standard theory. A nearly exponential dependence of mobility on 1/T is observed from 40° to 120°K, as predicted for scattering by optical vibrations of the lattice. The slope of the log μ versus 1/T data agrees quite well with the Debye Θ for the longitudinal optical mode as deduced from Reststrahl data. Below 40°K the observed mobilities can be explained in terms of a combination of the effects of optical, acoustical and charged impurity scattering. The last process appears to dominate below 15°K. High-field effects are observed which can be explained by classical transport theory assuming a conduction band of standard form as well as isotropic scattering. (Author)

THE INTERACTION OF DISLOCATIONS WITH AN APPLIED STRESS IN ANISOTROPIC CRYSTALS, by G. de Wit and J. S. Koehler. Technical rept. no. 6 on Contract Nonr-1836(26). June 59, 125p. 14 refs. AD-218 496.
Order from LC mi$6.30, ph$19.80 PB 147 460

The differential equation of equilibrium is derived for a dislocation pinned at 2 points in the same glide plane in an elastically anisotropic crystal with an applied stress. It is assumed that the dependence of the dislocation energy on the geometry of the dislocation line is accounted for by using an energy per unit length, E, which for fixed Burgers vector is a function only of θ the angle between the Burgers vector and the dislocation segment. A parametric solution of the differential equation is found in terms of E and its derivatives. When the orientation dependence of E is approximated by that of the elastic energy per unit length of a long straight dislocation, numerical work done for some real face centered cubic and body centered cubic crystals indicates that the first few terms in a Fourier expansion give a good fit to E. Using this expansion, the solution of the differential equation is plotted so that only one curve is needed to obtain the equilibrium shape of the dislocation for all values of the stress. Appreciable deviation from a circle is found. The above information about dislocation shape versus applied stress, together with some simple assumptions concerning dislocation density enables one to calculate the average strain produced in a crystal under applied stress when dislocations are present as compared to a crystal with no dislocations. (Author)

NUCLEAR QUADRUPOLE RESONANCE IN IRRADIATED ORGANIC CRYSTALS AND IN A SEMICONDUCTOR ELECTRON SPIN RESONANCE IN CARBONACEOUS ROCKS, by Jules Duchesne. Technical scientific note no. 1 on Contract AF 61(052)167. 31 Jan 60, 44p. 15 refs. AFOSR-TN-59-1214.
Order from LC mi$3.30, ph$7.80 PB 147 112

The intensity of quadrupole lines is used as a method for the study of the damage induced by high energy radiation in solid matter. Thermally treated irradiated compounds, which are thereafter re-irradiated, are especially considerd. In this connexion, the origin of radioprotection phenomena, and the behavior of the interactions between centers perturbed by irradiation, are studied further. Not only gamma-rays are used, but also X-rays and neutrons. The new method is successfully applied to a semiconductor. Parallel use of quadrupole spectroscopy and electron spin resonance is found highly valuable. (Author)

EFFECTS OF APPLIED ELECTRIC FIELDS ON PARAMAGNETIC RESONANCE IN CHROME ALUMS, by M. E. Browne. Rept. on Physical Electronics. Apr 60, 21p. 13 refs. LMSD-288212.
Order from LC mi$2.70, ph$4.80 PB 147 366

The paramagnetic resonance spectra of single crystals of potassium chrome alum and ammonium chrome alum have been investigated in the presence of applied electric fields at 9.3 kmc in the temperature range 4-300°K. The measurements were made in an effort to detect the possible existence of a term of the form $\xi \mu_0 \vec{\sigma} \cdot \vec{E}$ in the interaction Hamiltonian for an electron in an electromagnetic field. Such a term corresponds to the existence of an electron electric dipole moment and would result in a lifting of Kramers' degeneracy for a magnetic ion in a crystalline field. No such term was observed, and the upper limit on ξ obtained was $\xi < 0.007$. A dependence of the dielectric loss on electric field was observed in both alums at microwave frequencies, (Author)

SINGLE CRYSTAL GROWTH OF THE GARNET TYPE OXIDES. PART I. PHASE RELATIONS IN THE SYSTEM Fe_2O_3-Fe_3O_4-$YFeO_3$ IN AIR, by H. J. Van Hook. Scientific rept. no. 1 on Contract AF 19(604)5511. 29 Jan 60, 39p. 14 refs. AFCRC-TN-60-162.
Order from LC mi$3.00, ph$6.30 PB 147 056

Measurements have been made of temperature and ternary composition for coexisting liquid and crystalline phases on the air isobar in the system Fe_2O_3-Fe_3O_4-$YFeO_3$ with particular regard to the stability range and compositional limits of yttrium-iron garnet.

Phase equilibrium relationships were determined by conventional quenching techniques combined with measurements of loss in weight at the reaction temperature to locate true ternary compositions. The intersection of the air isobar with the ternary univarient boundary curve for coexisting magnetite, garnet and liquid phases results in an eutectic-type situation at the composition $Y_{0.27}Fe_{1.73}O_{2.87}$ and 1469° ± 2°C. A similar intersection of the isobar with the boundary curve for coexisting garnet, orthoferrite, and liquid phases gives rise to a peritectic-type reaction at 1555° ± 3°C and $Y_{0.44}Fe_{1.56}O_{2.89}$. The yttrium-iron garnet crystallizing from liquids within these temperature and composition limits contains up to 0.5 mole percent iron oxide in excess of the stoichiometric formula in terms of the starting composition 37.5 mole percent Y_2O_3, 62.5 mole percent Fe_2O_3. Loss of oxygen in the garnet phase is appreciable in this temperature range; approximately 3 mole percent FeO is present at 1470°C. Solubility of excess of iron oxide and partial reduction in air are invarient conditions during the growth process and the composition of the garnet formed can only be changed by a change in oxygen pressure.

POLARIZATION, MICROWAVE DISPERSION, AND LOSS IN HIGH-PERMITTIVITY FERROELECTRICS, by Howard Diamond. Rept. on Proj. Michigan, Contract DA 36-039-sc-78801. Jan 60, 103p. 33 refs. 2900-121-T; AD-231 701.
Order from LC mi$5.70, ph$16.80 PB 147 304

An analysis was conducted of experimental data, polarization, dispersion, and loss processes in high-permittivity ferroelectrics. The study proceeds from the observation that, according to published data, polycrystalline $BaTiO_3$ and similar compositions show strong relaxation in permittivity at microwave frequencies. This phenomenon is shown to be generally related to polarization and loss properties of the dielectric. Processes of particular interest in accounting for the microwave relaxation are: (a) domain effects, (b) possible dipolar or molecular polarization, and (c) mechanical effects produced by piezoelectric and electrostrictive coupling. The conclusions that may be drawn from this work are as follows: (1) the field sensitivity of the incremental permittivity of polycrystalline ferroelectrics is not a domain effect, but results from an induced ferroelectric state in nonferroelectric grains; (2) nonlinear permittivity under electric fields must necessarily be accomplished by substantial thermal sensitivity; (3) orientation of the domains does not contribute to microwave dispersion; (4) molecular or dipolar relaxation does not occur at microwave frequencies for $BaTiO_3$ single crystals; therefore this is not a mechanism for dispersion in the ceramic, and (5) dielectric loss as well as piezoelectric and electrostrictive activity would result in microwave dispersion in high-permittivity ferroelectrics. STOCHASTIC THEORY OF TRANSPORT PHENOMENA IN A REACTING PLASMA AT EXTREME TEMPERATURES, by H. J. Kaeppeler. Final rept. on Contract AF 61(514)1244. Mar 58, 109p. 28 refs. WADC TR-58-353; AD-155 704.
Order from LC mi$5.70, ph$16.80 PB 147 685

One of the essential tasks of theoretical plasma research is the development of an appropriate kinetic theory of nonequilibrium plasma behavior. The research reported on in this paper deals with attempts to establish such a theory. It is believed that many details of mathematical probability theory, especially the probability theory due to A. N. Kolmogoroff, are particularly well suited to describe the behavior of a system of particles, here a multi-component reacting plasma. An extension of Grad's method, including the presence of electric and magnetic fields, to the case of a non-isothermal multi-component reacting plasma is shown.

Institute for Fluid Dynamics and Applied Mathematics, U. of Maryland, College Park.
QUANTUM STATISTICAL PAIR DISTRIBUTION FUNCTION. GENERAL THEORY AND ITS APPLICATION TO THE ELECTRON GAS, by Shigeji Fujita. Doctoral thesis. Rept. on Contract AF 18(600)1315. Mar 60, 91p. 13 refs. Technical note BN-204; AFOSR-TN-60-435.
Order from LC mi$5.40, ph$15.30 PB 146 929

A general theory for calculating the pair distribution function for a quantum statistical system is developed and applied to the electron gas. A cluster integral expansion for the pair distribution function of both quantum and classical systems is derived. The simple chain approximation to the modified interaction is responsible for the transfer of a plasmon in the case of low temperature electron gas. The pair distribution function up to the first order in the modified interaction is calculated. A new expression which relates the internal energy with the pair distribution function is derived, assuming a system of many particles interacting through pair forces. This is used to calculate the ground-state energy of an electron gas. The result is in agreement with the work of Gell-Mann Bruckner.

Institute of Theoretical Physics, Stanford U., Calif.
MOTION OF A GYROSCOPE ACCORDING TO EINSTEIN'S THEORY OF GRAVITATION, by L. I. Schiff. Technical note no. 17 on Contract AF 49(638)388. Apr 60, 28p. 50 refs. AFOSR-TN-60-449.
Order from LC mi$2.70, ph$4.80 PB 147 355

It is pointed out that only the precession of the perihelion of the orbit of the planet Mercury provides an experimental verification of general relativity theory that goes beyond special relativity and the equivalence principle. In order to provide the theoretical basis for a new experimental test of the theory, the properties of a spinning test particle, or torque-free gyroscope, are calculated in detail.

Institute of Theoretical Physics, Stanford U., Calif.
PHOTOEFFECT FROM THE L SHELL, by R.H. Pratt. Technical note no. 15 on Contract AF 49(638)388. Apr 60, 37p. 20 refs. AFOSR-TN-60-417.
Order from LC mi$3.00, ph$6.30 PB 147 356

The differential cross section for photoeffect from an atomic shell is shown to be almost independent of principal quantum number, apart from normalization, for energies well above threshold. The high-energy limits of the total cross sections for the three L subshells are calculated exactly with methods previously applied to the K shell, and extrapolations are made to cover the entire high-energy region. A procedure is indicated to account for the effects of electron screening. It is found that the contribution from the P shells is not negligible in heavy elements. Agreement with experiment is good. (Author)

STEADY, FINITE MOTIONS OF A CONDUCTING LIQUID, by Robert R. Long. Technical rept. no. 8 on Contract Nonr-248(31). June 59, 15p. 8 refs. AD-219 397.
Order from LC mi$2.40, ph$3.30 PB 146 428

In certain cases of steady motion of a conducting fluid in a magnetic field the primitive equations may be integrated once, yielding a second order, partial differential equation in the stream function. This equation is highly non-linear in general but for certain choices of basic flow and magnetic fields it is tractable. Several arbitrary functions of integration have to be evaluated to make the analysis useful. This may be done in a region that remains undisturbed. A short discussion is given to suggest a procedure for deciding in a special case whether this undisturbed region is upstream or downstream. (Author)

A DISCUSSION OF TWO INCOMPRESSIBLE MAGNETOHYDRODYNAMIC FLOWS, by Keith P. Kerney. Part 3 of rept. on Research on the Comprehensive Theory of Plasma States and Phenomena, Contract AF 33(616)5693. Oct 59, 59p. 7 refs. Technical rept. 399; WADD Technical rept. 59-486, Part 3.
Order from LC mi$3.60, ph$9.30 PB 147 780-3

This report is a presentation of approximate solutions to two problems involving the flow of an incompressible viscous fluid having low electrical conductivity through a transverse magnetic field. The first problem is that of simple pipe flow. It is shown that the effects of the Hall current and ion slip can be incorporated into the continuum solution, to a first order, and that the effects of induced properties are of the order of magnetic Reynolds number. The second problem involves the Falkner-Skan flow; it is shown that the external magnetic field must be of the order of the square root of the velocity divided by the length for similar solutions to exist. Further analysis shows that, unless the conductivity vanishes outside the boundary layer, the class of magnetic fields required for similar solutions leads to singularities in the external field. THE EQUATION OF STATE OF AN IONIZED GAS, by George K. Bienkowski. Master's thesis. Part 2 of rept. on Research on the Comprehensive Theory of Plasma States and Phenomena, Contract AF 33(616)5693. Sep 59, 68p. 10 refs. Technical rept. 398; WADD Technical rept. 59-486, Part 2.
Order from LC mi$3.90, ph$10.80 PB 147 780-2

Electrically conducting gases, because of the long-range coulombic forces acting between the particles, are not amenable to the usual treatment of dilute-gas kinetic theory. Calculation of the equilibrium equation of state through the molecular approach must include the forces between particles if it is to correspond to physical reality. In the methods of kinetic theory this implies that potential energy and thus spatial distribution of particles is not negligible. Since it can be shown that the exact equation of state can be computed with the additional knowledge of the distributions of particle-pairs, equilibrium pair distribution functions were investigated. The existing Debye-Huckel approximation as applied to an ionized gas was found to have some limitations as well as theoretical difficulties. The equations which can determine the distribution functions are hopelessly non-linear except for asymptotic regions and therefore approximate solutions are derived for the non-linear range and quantum effects in the ion-electron interactions are included. The resulting distributions are used to calculate the equation of state. Higher order effects resulting from the volume of the particles and attractive forces between the charged and neutral particles are evaluated and found to be at least of an order of magnitude smaller than the coulombic effects in the region under consideration.

Naval Supersonic Lab., Mass. Inst. of Tech., Cambridge.
A MICROSCOPIC ANALYSIS OF MAGNETO-GAS-DYNAMICS, by Eugene E. Covert. Report presented at the Third Biennial Gas Dynamics Symposium, August 24-26, 1959, Northwestern U., Evanston, Ill. [1959] 48p. 45 refs. Technical rept. 395.
Order from LC mi$3.30, ph$7.80 PB 147 267

The kinetic theory approach to magneto-gas-dynamics is discussed. The several methods of considering interactions, in which the long range forces are of importance, are compared critically. In particular, the effects of the magnetic field on the particle interactions and their trajectories are shown to introduce anisotropies in magneto-gas-dynamics. The effects of these anisotropies are briefly discussed. (Author)

A REVIEW OF THE LITERATURE OF PLASMA PHYSICS, by Eugene F. Covert and Keith Kerney. Part 1 of rept. on Research on the Comprehensive Theory of Plasma States and Phenomena, Contract AF 33(616)5693. July 59, Second printing. 177p. 677 refs. Technical rept. 373; WADD Technical rept. 59-486, Part 1; AD-227 556.
Order from LC mi$8.10, ph$27.30 PB 147 780-1

The level of development of plasma physics is discussed. It is found that the present theories account for the experimental effects if: (1) the plasma is sufficiently dense that the time between collisions is small compared to the time an atom stays in the excited state but is sufficiently rare that the volume of the particles making up the plasma is very much smaller than the volume of plasma; (2) the potential energy between particles is the sum of the particles potential energy; and (3) the excitations are sufficiently weak, or the duration of the event is sufficiently short, that linearized theories are applicable. The complexity of the basic equations allows the inference to be drawn that it is possible for interesting phenomena to exist which are not yet discovered, and that the known but unexplained phenomena are contained within these equations. HARDNESS OF THE AXIALLY-SYMMETRIC MAGNETIC PISTON, by Allen B. Schaffer. 8 Jan 60, 30p. 4 refs. STL/TR-60-0000-09011.
Order from LC mi$2.70, ph$4.80 PB 146 925

A magnetic field travelling down a transmission line is to be used as a magnetic piston to push plasma. This report considers the effect of plasma leakage through the magnetic piston. By means of an order-of-magnitude treatment of the momentum equation, an expression which gages the leakage is derived. This expression can be useful in estimating the leakage and in comparing various designs for hardness to leakage. The leakage is found to vary inversely as the magnetic Reynolds No. (Author)

Physical Research Lab. Space Tech. Labs., Inc., Los Angeles, Calif.
A STUDY OF PLASMA STABILITY IN MICROWAVE CAVITIES BY A FREQUENCY-SHIFT ANALOG, by Robert A. Swanson. Rept. on Thermonuclear Propulsion Research, Contract AF 04(647)309. [1959] 15p. 3 refs. TR-59-0000-00812.
Order from LC mi$2.40, ph$3.30 PB 146 839

An equation is derived which relates the pressure change at a perturbed microwave cavity boundary to the change in resonant frequency of the cavity. The equation is used to obtain information on the stability of a plasma confined by microwave fields. (Author)

Physical Research Lab., Space Tech. Labs., Inc., Los Angeles, Calif.
TRANSVERSE PINCH OSCILLATIONS, by Burton D. Fried. Rept. on Contract AF 04(647)309. 24 Mar 60, 10p. 1 ref. STL/TN-60-0000-09059.
Order from LC mi$1.80, ph$1.80 PB 146 873

It is shown that the oscillations or "bouncing" of a transverse pinch like those observed by Wuerker, et al. are predicted by a simple model in which no trapped magnetic field is assumed.

Physical Research Lab., Space Tech. Labs., Inc., Los Angeles, Calif.
STX--A PROPOSED THERMONUCLEAR DEVICE, by Richard W. Hales. Rept. on Contract AF 04(647)309. 15 Apr 60, 16p. 11 refs. STL/TR-60-0000-09085.
Order from LC mi$2.40, ph$3.30 PB 147 007

A thermonuclear device, STX, is discussed in this design study which would combine the features of the linear and transverse pinches. The name derives from the use of two magnetic fields for containment which are crossed in space and time--that is, orthogonal in space (B_θ and B_z) and in time quadrature. (Author)

SIMULATION CONSIDERATION FOR THE EXPERIMENTAL INVESTIGATION OF ELECTROMAGNETIC PROPAGATION THROUGH THE PLASMA SHEATH, by Raymond L. Chuan. Technical note on Contract AF 19(604)5722. 29 Feb 60, 23p. 10 refs. USCEC rept. 71-201; AFCRC-TN-60-172.
Order from LC mi$2.70, ph$4.80 PB 146 871

The study of electromagnetic propagation through the plasma sheath surrounding a hypersonic vehicle under controlled laboratory conditions is considered within the capabilities of existing laboratory facilities at the University of Southern California Engineering Center. The severe limitations of the theoretical treatment of the interaction problem because of inadequate understanding of the gasdynamics involved are pointed out; which necessitate experimental studies, provided simulation is adequate and similarity conditions can be met. Scaling parameters are established, and are shown to be generally compatible with laboratory conditions. The advantages of using a wind tunnel for such studies are pointed out; and a current program at USC is described, which provides simulation of actual flight conditions encountered at 300,000 to 450,000 feet altitude. ON A MODIFIED BETHE-GOLDSTONE EQUATION, by Amnon Katz. Technical note no. 1 on Contract AF 61(052)337. 1 Feb 60, 39p. 16 refs. AFOSR-TN-60-307.
Order from LC mi$3.00, ph$6.30 PB 146 421

A many fermion system with BCS interaction is treated by a modified BG equation which takes into account a self consistent spreading of the Fermi surface. Our method employs a modified wave function which is an eigenstate of one modified hamiltonian and from which energies are determined by another. Pairs with total momentum o are treated as elementary entities. All modifications are achieved by a "projection operator" which a priori takes care of the interference between pairs due to their statistics. The only case solved is the one where all interacting pairs go into the Cooper state of the modified hamiltonian. The results are identical with those of BCS. (Author)

AN EXPERIMENTAL STUDY OF THE INTERACTION OF STRONG SOUND FIELDS WITH FREE CONVECTION BOUNDARY LAYERS, by Arthur L. Sprott, Jack P. Holman, and Frederick L. Durand. Nov 59, 32p. 11 refs. WADC Technical rept. 59-717.
Order from OTS $1.00 PB 161 724

It is demonstrated experimentally that strong progressive sound fields may interact with a free convection boundary layer on a horizontal cylinder in such a manner as to produce increases in heat transfer rates of the order of 100 percent. Shadowgraph flow visualization studies indicate that the mechanism of the interaction is such that a separated flow region on the upper side of the cylinder is produced. No effect on the boundary layer or heat transfer is observed until the sound intensity is raised above a certain critical value. For the experiments described in the paper, the critical sound pressure level ranged from 134 to 138 decibels. In a qualitative analysis of the experimental results it is postulated that the increase in heat transfer is the result of an interaction of the phenomenon of acoustical streaming with the free convection boundary layer. It is also believed that the mechanism of thermoacoustic transduction may be applicable. (Author)

CONVECTIVE FLOW DUE TO ACOUSTIC VIBRATIONS IN HORIZONTAL RESONANT TUBES, by Thomas W. Jackson and Harold L. Johnson. Final rept on Contract AF 49(638)459. Mar 60, 40p. 10 refs. AFOSR-TR-60-52.
Order from LC mi$3.00, ph$6.30 PB 146 432

This study consisted of an experimental investigation of the convective flow due to acoustic vibrations in a horizontal resonant tube. The flow was made visible by illuminating smoke particles in the air by means of a 200 watt-second flash filament source and recording the motion photographically.

Guggenheim Jet Propulsion Center, Calif. Inst. of Tech., Pasadena.
ELECTRODE BOUNDARY LAYERS IN DIRECT CURRENT PLASMA ACCELERATORS, by Jack L. Kerrebrock. Technical note no. 1 on Contract AF 49(638)758. Jan 60, 52p. 7 refs. AFOSR-TN-60-287.
Order from LC mi$3.60, ph$9.30 PB 146 773

One of the problems which must be faced in the development of direct-current plasma accelerators is that of boundary layer growth on the electrode surfaces. These surfaces must be maintained at a somewhat lower temperature than is desirable in the bulk of the gas flow. The associated reduction in electrical conductivity near the electrode surface, together with the continuous current through the boundary layer, may result in greatly augmented Joule heating near the surface, and increased heat transfer. This phenomenon is treated within the framework of boundary layer theory. It is found that similar solutions for the thermal and viscous boundary layers exist for a certain class of accelerated flows in which the velocity varies as a power of the streamwise coordinate. The solutions show that the heat transfer rate at Mach numbers near unity may be as much as ten times that which would be expected for a normal boundary layer. At higher Mach numbers, the similarity is not precisely valid; however, the analysis indicates qualitatively that a stagnation enthalpy overshoot may occur in the high temperature portion of the boundary layer as a result of the electromagnetic acceleration. (Author)

THE MEASUREMENT OF THE THERMAL CONDUCTIVITY OF GASES AT HIGH TEMPERATURE, by Charles F. Bonilla, Barry L. Tarmy, and C. S. Lee. Progress rept. on Contract Nonr-266(11). 20 Jan 54, 33p. 13 refs. CU-1-54-Nonr-266(11)-Ch.E; AD-35 482.
Order from LC mi$3.00, ph$6.30 PB 147 156

A method for the measurement of the thermal conductivity of gases is derived which is independent of radiation. The method employs a hot-wire cell with its wire heated by a sinusoidal ac superimposed upon a dc. The operating conditions under which the radiation introduced no appreciable error are indicated as well as the inherent limitations of the method. Optimum cell design and operating conditions are suggested. Results indicated that it is possible to obtain the thermal conductivity of gases at high temperature from electrical responses which are sufficiently sensitive to thermal conductivity but are insensitive to wire-to-wall radiation. The phase lag of the third harmonic of voltage produced across the wire with respect to some standard appeared to be a sensitive indicator of thermal diffusivity for gases at high temperatures. It appears to be possible to use the amplitude of the third harmonic to measure the thermal diffusivity of liquids.

Institute of Research, Lehigh U. [Bethlehem, Pa.]
AN INTERFEROMETRIC STUDY OF SHOCK TUBE BOUNDARY LAYERS, by John R. Asbridge. Doctoral thesis. Technical rept. no. 14, 1955-1959 on Contract N7onr-39302. 10 Apr 59, 105p. 28 refs.
Order from LC mi$5.70, ph$16.80 PB 145 944

Boundary layers in the hot gas flow behind the shock wave on the walls of a rectangular shock tube have been studied for eleven flow conditions by observing their density structure with a Mach-Zehnder interferometer. The boundary layers are observed to be thin and slowly growing at first, possessing the structure and growth rate predicted by Mirels for laminar layers. This laminar structure extends for only a limited distance behind the shock. Then the boundary layer profile gradually becomes similar to that which has been observed for steady turbulent layers, although a systematic difference is detected for most flow conditions. The structure of the boundary layer during the transition from laminar to turbulent flow is observed to be consistent with the turbulent spot mechanism of transition, but no direct evidence for turbulent spots has been found. Free stream density variations coincident with the boundary layer growth are observed and presented.

A RELAXATION TIME TECHNIQUE FOR MEASUREMENT OF THERMAL DIFFUSIVITY, by George Sonnenschein and Robert A. Winn. Rept for Sep 58-May 59 on Materials Analysis and Evaluation Techniques. Feb 60, 29p. 7 refs. WADC Technical rept. 59-273.
Order from OTS $0.75 PB 161 752

A method has been developed for measuring the thermal diffusivity of solids under conditions of one-dimensional transient heat flow in a semi-infinite plate of finite thickness, adiabatically insulated at one face and subject to a constant thermal flux at the other. The method involves measurement of the time elapsed from start of exposure and of the temperature rise at a point along the direction of heat flow. The feasibility of the technique has been demonstrated on aluminum, Armco iron, copper, yttrium, and on a plastic laminate, covering the diffusivity range from 7 x 10-4 to 1.0 cm^2/ sec. and temperatures between 25 and 950°C. Republic Aviation Corp., Farmingdale, N. Y.
STATISTICAL THERMODYNAMICS APPLIED TO CHEMICAL KINETICS OF COMBUSTION, by Edwin F. Fricke. Rept. on Proj. MX-773. 1 Oct 47, declassified 30 Dec 55, 515p. Rept. no. EDR-22-407; ATI-22 410.
Order from LC mi$11.10, ph$78.90 PB 147 392

A general summary of the fields of thermodynamics is presented. The thermodynamic functions for all of the important combustion gases have been tabulated at 100° intervals from 300° to 5000° Kelvin. Several fuel gases have been investigated. The theoretical combustion equation for n-pentane has been developed for all types of air-fuel ratios. A complete survey of the methods of calculating the thermodynamic functions has been included. Atomic and molecular energy levels have been discussed in detail. All types of homogeneous gas reactions have been worked out. (Portions of this report will not reproduce well)

PLASMA JET TEMPERATURE STUDY, by Willard J. Pearce. Rept. for June 58-June 59 on Materials Analysis and Evaluation Techniques, Contract AF 33(616)5848. Feb 60, 111p. 42 refs. WADC Technical rept. 59-346.
Order from OTS $2.50 PB 161 735

Spectral methods for measuring plasma temperatures in the range 5,000 to 15,000°K have been compared on theoretical and experimental grounds. For plasma jets, the best method is to determine the temperature from the intensities of atomic lines or of ionic lines, from the relation I=KgA Exp(-E/kT). Tables of values of the required constants have been compiled and examples of various modifications of the method have been given. Technique and constants have been given which permit determination of radial distributions of temperature with the least difficulty. (Author)

Wave Propagation

INVESTIGATIONS OF GROUND CLUTTER AND GROUND SCATTERING, by Martin Katzin, Edward A Wolff, and Joel C. Katzin. Final rept. on Contract AF 19(604)5198. 15 Mar 60, 97p. 26 refs. Rept. no. CRC-5198-4; AFCRC-TR-60-127.
Order from LC mi$5.40, ph$15.30 PB 146 910

The physical mechanisms which are of importance in ground clutter are discussed, and ground clutter measurements are shown which reveal the presence of these mechanisms. The significance and properties of the radar length tensor (or polarization matrix) are pointed out. The radar length tensor for small circular disks is determined, and curves are shown for certain ranges of aspect. These are used to explain some previously unexplained horizontal/vertical and cross-polarization characteristics of sea clutter. Methods for measuring the radar length tensor are discussed, and typical coherent radar systems for ground scattering measurements are described. A new calibration technique for coherent radars is described which allows ground scattering measurements to be placed on a quantitative basis. (Author) (See also PB 146 911)

Electromagnetic Research Corp., Washington, D. C.
A REVIEW OF THEORIES AND MEASUREMENTS OF RADAR GROUND RETURN, by Edward A. Wolff. Scientific rept. no. 1 on Contract AF 19(604)5198. 29 Feb 60, 67p. 26 refs. Rept. no. CRC-5198-2; AFCRC-TN-60-173.
Order from LC mi$3.90, ph$10.80 PB 146 911

A summary of the principal sea and ground clutter measurement programs is presented and their results are compared. The principal theoretical work is reviewed for both sea and ground return. The theories reviewed include the corrugated surface, drop, and facet theories of sea clutter and the slightly rough surface and thin lossy cylinder theories of ground clutter. In addition, several miscellaneous theories based upon hypothetical statistical descriptions of the surface (such as arrays of spheres) are discussed. A comparison of the theoretical conclusions with the experimental results is made for each theory and the present status of our understanding of ground return is reviewed. (Author)

MILLIMETER SCATTERING RANGE AND PRELIMINARY MEASUREMENTS OF SCATTERING FROM METALLIC SPHERES, by C. I. Beard. Rept. on Contract DA 36-039-sc-75012. 2 May 58, 29p. 4 refs. Technical memo. no. EDL-M136. AD-200 299.
Order from LC mi$2.70, ph$4.80 PB 146 062

A millimeter-wavelength scattering range is described for measuring scattering from random volume and surface distributions. Calibration procedures are given including the angular measurement of scattering from metal spheres of ka = 14.9 and 20.

Electronics Research Lab., U. of California, Berkeley.
NEW RESULTS IN BACK SCATTERING FROM CONES AND SPHERIODS, by Andrejs Olte and Samuel Silver. Rept. on Contract N[7]onr-295(29). 15 July 59, 26p. 13 refs. Rept. no. 90; Series no. 60, issue no. 243; AD-225 150.
Order from LC mi$2.70, ph$4.80 PB 147 092

Experimental results are given for backscattering cross sections of cones, prolate spheroids, and oblate spheroids. A brief resume is given first of the image-plane technique used in measuring cross sections. Calibration data show that for cross sections of the order of that of spheres of 3 in. diameter the attainable accuracy is of better than 0.5 db. Cross section data for various aspects of the targets are compared with geometrical optics cross sections and those obtained by various other theoretical procedures. Some interpretation of the observed phenomena is made in terms of high frequency approximation techniques. (Author)

Lincoln Lab., Mass. Inst. of Tech., Lexington.
CHARACTERISTICS OF MOON-REFLECTED UHF SIGNALS, by S. J. Fricker, R. P. Ingalls and others. Rept. on Contract AF 19(122)458. 22 Dec 58, 61p. 14 refs. Technical rept. no. 187; AD-204 519.
Order from LC mi$3.90, ph$10.80 PB 146 054

A UHF (412 Mcps) CW bistatic moon-reflection experiment is described in which measurements were made of the total received power, the Faraday rotation, the Doppler shift and the fading rate of the moon-reflected signals. From the results, an effective radar cross-sectioned area of the moon was estimated to be 7 x 10^{11} square meters. An explanation for the cause of the rapid fading of the signal, based on dynamical considerations alone, gives numerical results that agree well with the measured fading rates. (Author)

STUDIES IN RADAR CROSS SECTIONS 36. DIFFRACTION OF A PLANE WAVE BY AN ALMOST CIRCULAR CYLINDER, by P. C. Clemmow and V. H. Weston. Rept. on Contract AF 19(604)4993. Sep 59, 56p. 10 refs. Rept. no. 2871-3-T; AFCRC-TN-59-955; AD-232 129.
Order from LC mi$3.60, ph$9.30 PB 145 969

The two-dimesional problem of an E-polarized plane wave incident on a perfectly conducting cylinder of almost circular cross section is treated, the maximum deviation of the perimeter of the cross section from a strict circle being regarded mathematically as an infinitesimal quantity whose second and higher powers are neglected. The method of solution uses infinite Fourier transform techniques, but an analysis involving a Watson transformation, more traditional in this type of problem is also given. Various Bessel function results are required, some of which are derived in appendices. Attention is for the most part directed to

the case in which the mean radius is large compared to the wavelength, and the form of the solution then appropriate is examined in some detail. In particular, initial terms of asymptotic expansions in inverse powers of the mean radius to wavelength ratio are obtained both for the specular and for the creeping contributions to the far field. (Author) (See also PB 137 260)

Michigan U. Coll. of Engineering, Ann Arbor.
STUDIES IN RADAR CROSS SECTIONS 38. NON-LINEAR MODELING OF MAXWELL'S EQUATIONS, by J. E. Belyea, R. D. Low, and K. M. Siegel. Rept. on Contract AF 19(604)4993. Dec 59, 49p. 6 refs. Rept. no. 2871-4-T; AFCRC-TN-60-106; AD-232 130.
Order from LC mi$3.30, ph$7.80 PB 145 967

Non-linear modeling was accomplished with regard to the simple harmonic oscillator, the non-linear spring equation, Euler's equation, the Boltzmann equation, a general non-linear oscillator equation, and the scalar wave equation. A method is included which shows how to non-linearly model Maxwell's equations by utilizing the non-linear modeling of the scalar wave equation. Despite the a priori expectation that non-linear modeling was at best mathematically very complex, if not impossible, it now appears possible to non-linearly model more difficult equations, such as the coupled set consisting of Maxwell's equations and the Boltzmann transport equation. CARRIER FREQUENCY DEPENDENCE OF THE BASIC TRANSMISSION LOSS IN TROPOSPHERIC FORWARD SCATTER PROPAGATION, by Kenneth A. Norton. 12 May 60, 67p. 20 refs. Technical note no. 53.
Order from OTS $1.00 PB 161 554

A further interpretation is given of certain Lincoln Laboratory data obtained in an experiment using scaled antennas as presented in a recent letter to the Proceedings of the I.R.E. from Bolgiano (47, 331 (1959)). This paper has four objectives: first, to clarify the significance of these data from the standpoint of the engineer developing long-range tropospheric scatter systems; second, to apply a further statistical analysis to these data; third, to consider their significance as regards the theory of radio propagation through a turbulent atmosphere; and fourth, to describe a suitable method for the measurement of the meteorological parameters entering the theory. Based on this analysis of the Lincoln Laboratory data, it is concluded that the carrier frequency dependence of the basic transmission loss cannot be variable from hour to hour. (Author)

National Bureau of Standards, Boulder [Colo].
FIELD STRENGTH CALCULATIONS FOR E.L.F. RADIO WAVES, by James R. Wait and Nancy F. Carter. Mar 60, 37p. 26 refs. Technical note no. 52.
Order from OTS $0.50 PB 161 553

The mode theory of propagation of electromagnetic waves at extremely low frequencies (1.0 to 3000 c/s) is briefly reviewed in this paper. Starting with the representation of the field as a sum of modes, approximate formulas are presented for the attenuation and phase constants. At the shorter distances, where the range is comparable to the wavelength, the spherical-earth mode series is best transformed to a series involving cylindrical wave functions. This latter form is used to evaluate the near field behavior of the various field components. The effect of the earth's magnetic field is also evaluated using a quasi-longitudinal approximation which is particularly appropriate for propagation in the magnetic meridian. In general it is indicated that if the gyro frequency is comparable or greater than the effective value of the collision frequency, the presence of the earth's magnetic field may be important for E.L.F. In this case the attenuation may be increased somewhat. The influence of a purely transverse magnetic field is also considered. (Author)

Radio noise measurements are being made at 16 stations in a world-wide network. The attached tables are based on three parameters of the noise: (1) the mean power, (2) the mean envelope voltage, and (3) the mean logarithm of the envelope voltage. (See also PB 151 377)

Stanford Electronics Labs., Stanford U., Calif.
RADAR MEASUREMENTS OF METEOR ACTIVITY WITH APPLICATIONS TO COMMUNICATIONS, by R. F. Mlodnosky. Scientific rept. no. 7 on Contract AF 19(604)2193. 18 Apr 60, 119p. 30 refs. AFCRC-TN-60-363.
Order from LC mi$6.00, ph$18.30 PB 147 284

From two years of radar measurements of meteor ionization trails, new information has been obtained on the directions of arrival (radiants) of meteoric particles into the earth's upper atmosphere. This information has important application in several techniques of radio communication where information is sent over great distances by means of radio reflections from ionized meteor trails. The contributions of this report include: (1) new experimental results on the meteor radiant distribution; (2) a theoretical explanation of the salient features of this radiant distribution; (3) refinements in a technique of using radar (back-scatter) measurements to determine directional characteristics of forward-scatter, meteor-propagated communications; and (4) actual predictions of diurnal and seasonal variations of propagation characteristics of meteor communication systems based upon the long-term radar measurements.

Stanford Electronics Labs., Stanford U., Calif.
RESEARCH ON POLAR RADIO PROPAGATION BLACKOUTS, by R. D. Egan, A. M. Peterson, and D. S. Pratt. Scientific rept. no. 1 on Contract AF 19(604)4103. 28 Apr 60, 36p. 16 refs. AFCRC-TN-60-187.
Order from LC mi$3.00, ph$6.30 PB 147 360

Polar radio communication blackouts are a frequent result of ionospheric storms, which result from unusual solar activity. The study of communication outages is producing information on the geographical region of communication circuit failure associated with such disturbances. The current report analyzes signal amplitude data taken at Boston and Stanford during August, 1959. Through the use of hourly versus daily contour plots of signal strength and other statistical analysis of the data from each of the circuits involved, it has been found that a major disturbance will produce a communications blackout over the entire western polar region. More localized effects are noted during moderate storms.

CONSTRUCTION OF ERROR-CORRECTING CODES USING FILTERING TECHNIQUES, by Thomas E. Stern. Technical rept. T-1/M on Contract Nonr-266(60). [1959] 38p. 11 refs. CU-4-59-Nonr-266(60); AD-218 673.
Order from LC mi$3.00, ph$6.30 PB 147 082

Nonlinear filtering techniques are used to develop systematic methods for the construction of close-packed multilevel single error-correcting codes, coders, and decoders. Coding and decoding are achieved through the use of linear modular sequential circuits followed by a nonlinear decision element. The synthesis of an appropriate decoding filter is based upon the selection of a matrix over the modular field GF(p), whose powers display a periodicity with maximal length period. The properties of these matrices are shown to depend upon the properties of the elements of a Galois field, and several theorems from Galois theory are used in the selection of the decoding filter. (Author)

DEVELOPMENT OF AERIAL DRONE NIGHT PHOTOGRAPHIC SYSTEM, by H. Korth. Final technical rept. for May 56-Aug 58 on Contract DA 36-039-sc-72350. Aug 58, 61p. SME-AB-10; AD-220 357.
Order from LC mi$3.90, ph$10.80 PB 147 020

A summary is presented of the activities involved in the design and development of an aerial night photographic system and its subsequent testing and installation in the drone. With respect to the design of the system, special emphasis had to be placed upon the film speed requirements during the FMC portion of the camera cycle and its coordination with illumination as provided by means of photoflash cartridges. Optical, operational, and environmental testing was performed according to the test specifications. Some difficulties were encountered during low temperature operation, particularly since heaters were not to be employed. (Research Methods--Photographic Equipment, Installation of the camera and its supporting equipment into the drone was accomplished without encountering any unusual difficulties. Development of an alternate motor and cartridge ejection pulse combination in order to enable the camera to operate at higher altitudes was accomplished. (Author)

COMPETITIVE STABILITY UNDER WEAK GROSS SUBSTITUTABILITY: THE "EUCLIDEAN DISTANCE" APPROACH, by Kenneth J. Arrow and Leonid Hurwicz. Technical rept. no. 77 on Contract Nonr-225(50). 31 July 59, 21p. 7 refs. AD-220 502.
Order from LC mi$2.70, ph$4.80 PB 147 058

Previous studies on the global stability of the competitive equilibrium made assumptions which implied the existence of an equilibrium price vector with all components positive. These restrictions are removed in this analysis by an extension of the Euclidean distance argument. In conjunction with the other assumptions, the square of the distance to any equilibrium is shown sufficient to imply stability even if the equilibrium have some zero components.

Applied Mathematics and Statistics Lab., Stanford U., Calif.
OPTIMAL INVENTORY DEPLETION, by Peter W. Zehna. Technical rept. no. 41 on Contract N6onr-251(26). 24 July 59, 84p. 6 refs. AD-220 507.
Order from LC mi$4.80, ph$13.80 PB 147 063

Optimal LIFO and FIFO policies for depleting stock are analyzed. A condition yielding LIFO as an optimal policy for all n for a convex, twice differentiable function L(s), is proved to be that $\frac{L''(S)}{L'(S)}$ is a nondecreasing function. This condition encompasses the special life functions found by Derman and Klein [Management Sci. 4 no. 4:450-456, 1958], and the theorem is applied to give an immediate generalization. LIFO is found optimal for a concave field life L(S) provided that $L'(S) < -1$ for all S. Investigation of the FIFO policy shows that Lieberman's condition [Management Sci. 5 no 1:102-105, 1958], $L'(S) \geq -1$ yielding FIFO as optimal for L(S) concave and monotone, may be extended to include nonmonotone functions and that for concave functions, the condition is necessary as well as sufficient. It is also proved that whenever L(S) is convex and $L'(S) \geq 1$, then FIFO is again optimal for all n. In the special case $L(S) = a + bS$ ($a > 0$, $-1 < b > 0$), so that $L'(S) > -1$, it is proved that FIFO remains the optimal policy for 2 demand sources. When L(S) is either convex or concave with $L'(S) < -1$ for all S, LIFO is optimal for 2 sources. A general theorem is proved whereby whenever LIFO or FIFO is the optimal policy for 2 demand sources, the same will remain true for any finite number of sources greater than 2.

Applied Mathematics and Statistics Labs., Stanford U., Calif.
SOME REMARKS ON THE EQUILIBRIA OF ECONOMIC SYSTEMS, by Kenneth J. Arrow and Leonid Hurwicz. Technical rept. no. 76 on Contract Nonr-225(50). 23 July 59, 13p. 4 refs. AD-219 878.
Order from LC mi$2.40, ph$3.30 PB 147 057

The following theorem is proved: if the aggregate excess demand functions satisfy the weak axiom of revealed preference, then (1) the instantaneous adjustment process is stable (whether or not there is a numéraire, and (2) the set of equilibrium points is convex. A corollary is given that if all commodities are weak gross substitutes, the instantaneous process is stable and the set of equilibria is convex. Two examples are given of non-unique equilibrium in which the weak axiom of revealed preference holds for the aggregate excess demand functions.

California U., Los Angeles.
A HAND-COMPUTED VERSION OF UCLA EXECUTIVE DECISION GAME NO. 2, by K. R. MacCrimmon and J. R. Jackson. Rept. on Management Sciences Research Proj. Contract [Nonr 233(02)]. 5 May 59, 42p. Research rept. no. 59; AD-218 307.
Order from LC mi$3.30, ph$7.80 PB 147 128

California U., Los Angeles.
MULTIPLE SERVERS WITH LIMITED WAITING SPACE, by James R. Jackson. Rept. on Management Sciences Research Proj. [Contract Nonr-233(02)]. 27 Nov 57, 10p. 6 refs. Discussion paper no. 62.
Order from LC mi$1.80, ph$1.80 PB 137 921

The purpose of the present note is to clarify, for the simples "Poisson-exponential," multiserver systems, the relation connecting the proportion of customers requiring special treatment, the number of waiting spaces in the line, and the ratio of imposed workload to full-utilization capacity of the system. General relations are derived, and computational results are summarized in graphical and tabular form.

Benson-Lehner Corp., Los Angeles, Calif.
A SUGGESTION FOR AN IMPROVED DATA BANKING SYSTEM, by Eberhard Weber. Rept. on Contract Nonr-2666(00). 15 July 59, 25p. 2 refs. Research rept. 59-8; AD-225 097.
Order from LC mi$2.70, ph$4.80 PB 147 093

The need for an improved data storage and retrieval system has led to entirely new solutions to the problem. This study has resulted in the suggestion of a parallel-parallel system in which the requirements for improvement were fulfilled. A possible method of implementing this suggested system has been described in terms which, thought not necessarily representative of the ultimate solution, will lead in the direction of the ultimate solution.

Hebrew U., Jerusalem.
SOME THEORETICAL ASPECTS OF THE MECHANIZATION OF LITERATURE SEARCHING, by Yehoshua Bar-Hillel. Technical rept. no. 3 on Contract N62558-2214. Apr 60, 81p. 67 refs.
Order from OTS $2.25 PB 161 547

Data-providing information systems are distinguished from reference-providing systems. References can be provided in (at least) four stages: accession numbers, citations, abstracts, and copies of the documents recommended as pertinent to a request. The problem of false drops loses much of its force for reference-providing in stages. Shortcircuiting reference-providing by directly scanning an encoded document collection with the help of high-speed electronic computers is rejected. Automatic indexing and extracting are criticized as either leading to inferior products or else as being uneconomical. It is also deemed not feasible to mechanize the formulation and reformulation of the request, perhaps in the form of a certain Boolean function over the topic terms, up to the printing of the reference list.

MISCELLANEOUS

Naval Research Lab., Washington, D. C.
REPORT OF NRL PROGRESS, June 60.
Order from OTS $1.25, $10.00/year PB 161 282

Contents:
Articles:
Meteorological measurements in the South Atlantic, by Wave Propagation Branch Staff
X-ray photographs of the sun, by Ens. R. Blake and A. E. Unzicker
Review of recent work at NRL on irradiation effects in magnetic alloys, by E. I. Salkovitz and A. I. Schindler
Scientific program:
Astronomy and Astrophysics: Measurements of celestial sources at a wavelength of 10.2 cm. Variable intensity of wind turbulence in the troposphere and in the stratosphere
Chemistry: An improved dc interrupter for use in fundamental studies of electrode reactions
Mechanics: Fracture testing of high-strength sheet materials under conditions appropriate for stress analysis. Effect of chamfered bolt holes on bolts in shear under dynamic loads. NRL three-stage, high-velocity, light-gas gun
Metallurgy and Ceramics: The determination of chlorides in titanium metal. Effect of environment on the creep-rupture properties of aluminum alloys. Low-temperature thermoelectric power of palladium and palladium-nickel alloys containing absorbed hydrogen. The dependence of surface tensions of liquid metals on their energies of vaporization per unit volume. Preliminary neutron-flux survey of core facility at ORNL low-intensity test reactor
Radio: Phase control of high-power amplifiers. Instrumentation for the classification of space signals. Precision time and frequency standards for Naval radio station NPM
Solid State Physics: New thermoluminescent dosimeter has total linear range of eight decades. Energy conversion efficiency of cerium-activated glass. Tables of Einstein energy, specific heat, and derivative specific heat functions
Sound: High-power, transistorized amplifiers for sonar applications

ATOMIC ENERGY COMMISSION REPORTS

Reports may be purchased in accordance with instructions on the inside front cover of the U. S. GOVERNMENT RESEARCH REPORTS. As PB numbers are not indicated, order by series and number. These reports may also be consulted at any AEC Depository Library. A list of these libraries may be obtained from the U. S. Department of Commerce, Office of Technical Services, Washington 25, D. C.

Reproduction in whole or part of any report listed herin is encouraged by the U. S. Atomic Energy Commission, subject to the approval of authors or originating sites. General inquiries from the industrial press about AEC-developed information should be directed to the Industrial Information Branch, Atomic Energy Commission, Washington 25, D. C.

General

Air and ground inspection techniques for the detection of underground explosive tests. Preliminary report, by R. M. Foose and R. B. Hoy. Stanford Research Inst., Menlo Park, Calif., and Office of Naval Research, Washington, D. C. Jan 59. Decl. Nov. 2, 1959. 131p. Order from LC. Mi $6.90, ph $21.30. ITR-1715

A class of casualty functions with special application to circular targets. Sandia Corp., Albuquerque, N. Mex. Aug 54. 35p. Order from LC. Mi $3.30, ph $7.80. SCTM-32-54-1

Results of a force test of seven configurations of the ultra-altitude vehicle in the Sandia Corporation 12- x 12-inch transonic wind tunnel (program III-43), by J. W. Arnold. Sandia Corp., Albuquerque, N. Mex. Oct 59. 73p. Order from LC. Mi $4.50, ph $12.30. SCTM-324-59(51)

Fixation of fission products. A literature search, by T. F. Davis. AEC Technical Information Service Extension, Oak Ridge, Tenn. May 60. 12p. Order from OTS. 75 cents. TID-3553

Public availability of reports. Abstracted in Nuclear Science abstracts, Book I and II. Technical Information Service Extension, Oak Ridge, Tenn. Feb 60. 618p. Order from OTS. $5.00 per set. TID-4000 (5th Ed.)

Earth stresses and earth strains, by W. R. Perret. Sandia Corp., Albuquerque, N. Mex. Sep 52. Decl. Sep. 29, 1959. 57p. Order from LC. Mi $3.90, ph $10.80. WT-503

Biology and Medicine

Radiological Physics Division semiannual report for July through December, 1959, by J. E. Rose and L. D. Marinelli. Argonne National Laboratory, Argonne, Ill. 1959. Contract W-31-109-eng-38. 127p. Order from OTS. $2.75. ANL-6104

Thermal radiation measurements (Parts I and II). Operation PLUMBBOB preliminary report, by A. L. Greig and H. E. Pearse. AEC Technical Information Service Extension, Div. of Biology and Medicine, Oak Ridge, Tenn. Jan 58. 35p. Order from OTS. 75 cents. ITR-1502

PUQFUA: An IBM-704 fortran code for determining plutonium body burden from urine assays, by J. N. P. Lawrence. University of California. Los Alamos Scientific Laboratory, Los Alamos, N. Mex. July 59. Contract W-7405-ENG-36. 33p. Order from OTS. $1.00. LA-2329

Standard-man phantoms, by R. L. Hayes. Oak Ridge Institute of Nuclear Studies, Inc., Oak Ridge, Tenn. Apr 60. 13p. Order from OTS. 50 cents. ORINS-35

Biometric analysis of a growth response of two plant species in a radioactive waste area, by G. L. Plummer. Oak Ridge National Laboratory, Health Physics Div., Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 7p. Order from OTS. 50 cents. ORNL-2903

Semi-annual progress report for July 1, 1959 through December 31, 1959, by Research Staff. University of Tennessee. AEC Agricultural Research Laboratory, Oak Ridge, Tenn. Apr 60. Contract AT-40-1-GEN-242. 55p. Order from OTS. $1.50. ORO-245

Gross beta radioactivity of the algae at Eniwetok Atoll, 1954-1956, by R. F. Palumbo. University of Washington, Laboratory of Radiation Biology, Seattle, Wash. Aug 59. Contract AT (45-1)-540. 32p. Order from OTS. $1.00. UWFL-61(Del.)

Chemistry—General

Chromatographic separation and ultraviolet analysis of polyphenyls, by W. W. West and K. L. Hall. California Research Corporation, Richmond, Calif. Jan 60. Contract AT(11-1)-174. 28p. Order from OTS. $1.00. AECU-4699

The molecular and viscous effusion of saturated vapors, by K. D. Carlson. Argonne National Laboratory, Argonne, Ill. Apr 60. Contract W-31-109-eng-38. 248p. Order from OTS. $3.50. ANL-6156

Specifications for cleanliness requirements. High Level Volatility Lab. 4507, by J. B. Ruch. Oak Ridge National Laboratory, Oak Ridge, Tenn. June 57. 4p. Order from LC. Mi $1.80, ph $1.80. CF-57-6-6

The compound $CuO \cdot 3UO_3$, by J. S. Gill and W. L. Marshall. Oak Ridge National Laboratory, Oak Ridge, Tenn. Aug 59. 12p. Order from LC. Mi $2.40, ph $3.30. CF-59-8-95

Reactions of hydrogen perocide and ion exchange resins, by E. W. Baumann. E. I. du Pont de Nemours & Co. Explosives Dept., Atomic Energy Div., Savannah River Laboratory, Aiken, S. Car. Apr 60. Contract AT(07-2)-1. 30p. Order from OTS. $1.00. DP-477

Reduction of plutonium (VI) with hydrogen peroxide, by M. N. Myers. General Electric Co. Hanford Atomic Products Operation, Richland, Wash. Aug 56. Decl. Nov 23, 1959. Contract W-31-109-Eng-52. 12p. Order from LC. Mi $2.40, ph $3.30. HW-44987

Fuels preparation department analytical laboratory manual. General Electric Co., Hanford Atomic Products Operation, Richland, Wash. June 59. Contract AT(45-1)-1350. 104p. Order from LC. Mi $5.70, ph $16.80. HW-59868

Transient pressures developed by sodium-nitric acid reactions, by C. E. Huck and J. J. Shefcik. General Electric Co. Hanford Atomic Products Operation, Richland, Wash. Oct 59. Contract AT(45-1)-1350. 4p. Order from LC. Mi $1.80, ph $1.80. HW-62450

Use of sorbent beds for transferring hydrogen gases, by D. H. Ahmann, P. S. Flint, and O. N. Salmon. General Electric Co. Knolls Atomic Power Lab., Schenectady, N. Y. June 54. Decl. Mar 13, 60. Contract W-31-109-Eng-52. 24p. Order from OTS. 50 cents. KAPL-1114

The colorimetric determination of boron in zirconium hydride, by G. R. Waterbury and C. F. Metz. Los Alamos Scientific Lab., N. Mex. July 54. Decl. Sep 29, 1959. Contract W-7405-eng-36. 35p. Order from LC. Mi $3.00, ph $6.30. LA-1844

The free energy, heat, and entropy of formation of thorium oxyfluoride, by A. J. Darnell. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. June 60. Contract AT(11-1)-GEN-8. 13p. Order from OTS. 50 cents. NAA-SR-5045

Decontamination testing of highly contaminated protective coatings, by G. A. West and C. D. Watson. Oak Ridge National Laboratory, Chemical Technology Division, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 23p. Order from OTS. 75 cents. ORNL-2811

Controlled potential coulometric titration of plutonium--application to PRFR samples, by W. D. Shults. Oak Ridge National Laboratory, Analytical Chemistry Div., Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 27p. Order from OTS. $1.00. ORNL-2921

The dimensional properties of molded silicone rubbers related to O-ring design, by G. W. Dyckes. Sandia Corporation, Albuquerque, N. Mex. Apr 60. 18p. Order from OTS. 75 cents. SC-4415(RR)

Transparent cold-shock-resistant epoxy casting resin, by B. Carroll and J. Smatana. Sandia Corporation, Albuquerque, N. Mex. Apr 60. 34p. Order from OTS. $1.00. SCR-173

Minutes of the yttrium analytical conference, [held at Argonne National Laboratory], November 7-8, 1956, by C. J. Rodden. Atomic Energy Commission, New Brunswick Lab., New Brunswick, N. J. Jan 57. Decl. Oct 1, 1959. 108p. Order from LC. Mi $5.70, ph $16.80. TID-7533

Chloride complexes of ruthenium (III), by D. A. Fine (Thesis). University of California.

Lawrence Radiation Laboratory, Berkeley, Calif. Feb 60. Contract W-7405-eng-48. 81p. Order from OTS. $2.25. UCRL-9059

Paramagnetic resonance of tetravalent Pa^{231}, by Ru-Tao Kyi (Thesis). University of California, Lawrence Radiation Laboratory, Berkeley, Calif. Mar 60. Contract W-7405-eng-48. 66p. Order from OTS. $1.75. UCRL-9109

Diffusion coefficients in multicomponent solvents, by J. T. Holmes (Thesis). University of California, Lawrence Radiation Laboratory, Berkeley, Calif. Apr 60. Contract W-7405-eng-48. 50p. Order from OTS. $1.75. UCRL-9145

A precise method for determining vanadium in essentially pure vanadium metal, by W. C. Dietrich. Union Carbide Nuclear Co. Division of Union Carbide Corporation, Y-12 Plant, Oak Ridge, Tenn. Mar 60. Contract W-7405-eng-26. 13p. Order from OTS. 50 cents. Y-1294

Chemistry—Radiation and Radiochemistry

Californium production in the high flux isotope reactor, by H. C. Claiborne and M. P. Lietzke. Oak Ridge National Laboratory, Oak Ridge, Tenn.. Aug 59. 24p. Order from LC. Mi $2,70, ph $4.80. CF-59-8-125

Protactinium and iodine activities from irradiated thorium, by G. H. Hanson. Phillips Petroleum Co., Atomic Energy Div., Idaho Falls, Idaho. June 54. Decl. Nov. 23, 1959. Contract AT (10-1)-205. 3p. Order from LC. Mi $1.80, ph $1.80. IDO-16265

The radiochemistry of americium and curium, by R. A. Penneman and T. K. Keenan. University of California, Los Alamos Scientific Laboratory, Los Alamos, N. Mex. Jan 60. 62p. Order from OTS. 75 cents. NAS-NS-3006

The radiochemistry of rhodium, by G. R. Choppin. Florida State University, Tallahassee, Fla. Jan 60. 32p. Order from OTS. 50 cents. NAS-NS-3008

The radiochemistry of molybdenum, by E. M. Scadden and N. E. Ballou. U. S. Naval Radiological Defense Laboratory, San Francisco, Calif. Jan 60. 38p. Order from OTS. 50 cents. NAS-NS-3009

The radiochemistry of barium, calcium, and strontium, by D. N. Sunderman and C. W. Townley. Battelle Memorial Institute, Columbus, Ohio. Jan 60. 118p. Order from OTS. $1.25. NAS-NS-3010

Second ammonia synthesis test--T-474893. Westinghouse Electric Corp., Atomic Power Div,, Pittsburgh, Pa. July 54. Decl. with deletions Mar 18, 1957. 40p. Order from LC. Mi $3.60, ph $6.30. WAPD-CP-535(Del.)

Chemistry—Separation Processes for Plutonium and Uranium

Spray fluorination of fused salt as a uranium recovery process. A preliminary feasibility study, by J. D. Gabor, and others. Argonne National Laboratory, Chemical Engineering Div., Argonne, Ill. Mar 60. Contract W-31-109-eng-38. 39p. Order from OTS. $1.25. ANL-6131

Chemical Technology Division, Chemical Development Section C, monthly progress report for September 1959, by K. B. Brown and others. Oak Ridge National Laboratory, Oak Ridge, Tenn. Oct 59. Contract W-7405-eng-26. 48p. Order from LC. Mi $3.30, ph $7.80. CF-59-8-85

Eurochemic assistance: Information on HAPO instrumentation development, by E. M. Shank. Oak Ridge National Laboratory, Oak Ridge, Tenn. Oct 59. Contract W-7405-eng-26. 4p. Order from LC. Mi $1.80, ph $1.80. CF-59-10-4

Eurochemic assistance program: Status report for April through September 1959, by E. L. Nicholson and E. M. Shank. Oak Ridge National Laboratory, Oak Ridge, Tenn. Oct 59. 7p. Order from LC. Mi $1.80, ph $1.80. CF-59-10-61

Improved method for precipitating manganese dioxide, by H. J. Clark, Jr. and others. E. I. dul Pont de Nemours & Co. Explosives Dept. Atomic Energy Div., Savannah River Laboratory, Aiken, S. Car. Feb 60. Contract AT(07-2)-1. 12p. Order from OTS. 50 cents. DP-444

Retention of iodine in process solutions by mercuric salts, by C. H. Holm. Hanford Works, Richland, Wash. June 51. Decl. with deletions July 7, 1959. Contract W-31-109-Eng-52. 22p. Order from LC. Mi $2.70, ph $4.80. HW-21103(Del.)

Improved spectrographic analysis of uranium and plutonium by the carrier concentration method,

by J. L. Daniel. Hanford Works, Richland, Wash. Oct 52. Decl. Oct 7, 1959. Contract W-31-109-Eng-52. 17p. Order from LC. Mi $2.40, ph $3.30. HW-25859

The recovery, purification, and concentration of plutonium by anion exchange in nitric acid, by J. L. Ryan and E. J. Wheelwright. General Electric Co. Hanford Atomic Products Operation, Richland, Wash. Jan 59. Decl. with deletions June 25, 1959. Contract W-31-109-Eng-52. 104p. Order from LC. Mi $5.70, ph $16.80. HW-55893 (Del.)

Preliminary chemical flowsheets for the decladding and dissolution of non-production fuels, by M. K. Harmon. General Electric Co. Hanford Atomic Products Operation, Richland, Wash. July 59. 9p. Order from LC. Mi $1.80, ph $1.80. HW-61106

Rates of reaction of irradiated UO_2 and uranium metal with sulfuric acid, by J. L. Swanson. General Electric Co. Hanford Atomic Products Operation, Richland, Wash. Aug 59. Contract AT(45-1)-1350. 8p. Order from LC. Mi $1.80, ph $1.80. HW-61482

Plant modifications for reprocessing non-production reactor fuels. Design criteria for fuel element storage facility, building 221-U, by M. E. Yates. General Electric Co. Hanford Atomic Products Operation, Richland, Wash. Aug 59. Contract AT(45-1)-1350. 16p. Order from LC. Mi $2.70, ph $4.80. HW-61510

Reprocessing of low-enrichment uranium-molybdenum alloy fuels, by W. W. Schulz and E. M. Duke. Hanford Atomic Products Operation, Richland, Wash. Sep 59. Contract AT(45-1)-1350. 37p. Order from OTS. $1.25. HW-62086

Technical progress report for April through June 1959, Idaho Chemical Processing Plant, by C. E. Stevenson and others. Phillips Petroleum Co., Atomic Energy Division, Idaho Operations Office, Idaho Falls, Idaho. Mar 60. Contract AT(10-1)-205. 73p. Order from OTS. $2.00. IDO-14494

Dissolution of zirconium and Zircaloy-2 in nitric-hydrofluoric acid mixtures at reflux temperatures, by E. M. Vander Wall, E. M. Whitener and D. L. Bauer. Phillips Petroleum Co., Atomic Energy Div., Idaho Falls, Idaho. Sep 59. Contract AT(10-1)-205. 29p. Order from OTS. 75 cents. IDO-14497

The chemical engineering of the radium process. Final report, by H. L. Rawlings. Mound Lab., Miamisburg, Ohio. June 51. Decl. Dec. 2, 1959. Contract AT-33-1-GEN-53. 56p. Order from LC. Mi $3.60, ph $9.30. MLM-609

The tellurium process: I. Application to solutions of bombarded bismuth. II. Application to extracts of residues from radioactive lead dioxide. Final report, by C. L. Rollinson and others. Monsanto Chemical Co., Dayton, Ohio. June 47. Decl. July 14, 1959. 114p. Order from LC. Mi $6.00, ph $18.30. MLM-M-167

Chemical pulverization of sintered uranium dioxide bodies. Part II. Pulverization scaleup, fissia studies, and pellet refabrication, by S. Strausberg and others. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. May 60. Contract AT(11-1)-GEN-8. 67p. Order from OTS. $1.75. NAA-SR-3911

Plant utilities. Technical report, by O. Jenne and R. Winckler. European Company for the Chemical Processing of Irradiated Fuels, Mol, Belgium. [1959]. 14p. Order from LC. Mi $2.40, ph $3.30. NP-7884

Controlled Thermonuclear Processes

Investigation of plasma acceleration, Quarterly progress report for January 1, 1959 through March 31, 1959, by K. C. Rogers and others. Stevens Inst. of Tech., Hoboken, N. J. 1959. Contract DA-36-039SC-78097. 8p. Order from LC. Mi $1.80, ph $1.80. AECU-4344

Quarterly report covering the period form October 1 through December 31, 1959, by K. Bernstein and others. Project Matterhorn. Princeton University, Princeton, N. J. Jan 60. Contract AT(30-1)-1238. 33p. Order from OTS. $1.25. MATT-Q-9

Electrode breakdown and shielding of intense discharges across the magnetic field, by J. W. Flowers. Oak Ridge National Laboratory, Thermonuclear Experimental Division, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 17p. Order from OTS. 75 cents. ORNL-2710

A capacitor monitor for high-energy capacitive storage banks, by J. L. Todd. Sandia Corporation, Albuquerque, N. Mex. Mar 60. 17p. Order from OTS. 75 cents. SCTM-45-60(13)

The hard-core pinch. Part II, by D. H. Birdsall, S. A. Colgate, and H. P. Furth. University of California. Lawrence Radiation Lab., Livermore, Calif. July 59. Contract W-7405-eng-48. 15p. Order from LC. Mi $2.40, ph $3.30. UCRL-5602

Confinement time of a Lorentzian gas in a mirror machine, by G. Gibson and E. J. Lauer. University of California. Lawrence Radiation Lab., Livermore, Calif. Nov 59. Contract W-7405-eng-48. 25p. Order from OTS. 75 cents. UCRL-5696

Numerical computations for self-consistent astron E layer with slowing down of electrons, by T. Seidman. University of California. Lawrence Radiation Lab., Livermore, Calif. Nov 59. Contract W-7405-eng-48. 9p. Order from OTS. 50 cents. UCRL-5789-T

Attainment of 10^{-9}mm Hg pressure in unbaked vacuum systems by molybdenum evaporation, by A. L. Hunt, C. C. Damm, and E. C. Popp. University of California. Lawrence Radiation Lab., Livermore, Calif. Feb 60. Contract W-7405-eng-48. 14p. Order from OTS. 50 cents. UCRL-5889

Enhanced interaction in the positive column, by G. Ecker. University of California. Lawrence Radiation Lab., Berkeley, Calif. Mar 60. Contract W-7405-eng-48. 43 pages. Order from OTS. $1.25. UCRL-9144

Criticality Studies

The analysis of flux-traverse measurements in the GWIN-Magnuson critical experiment, by E. Inonu. Oak Ridge National Lab., Oak Ridge, Tenn. Dec 59. 6p. Order from LC. Mi $1.80, ph $1.80. CF-59-12-2

Program for computing K for uranium salts, by T. B. Patterson. Goodyear Atomic Corp., Portsmouth, Ohio. Nov 59. 5p. Order from LC. Mi $1.80, ph $1.80. GAT-DM-787

Critical mass studies of plutonium solutions, by F. E. Kruesi, J. O. Erkman, and D. D. Lanning. Hanford Atomic Products Operation, Richland, Wash. May 52. Contract W-31-109-Eng-52. 82p. Order from OTS. $2.25. HW-24514 DEL

Minutes of criticality instrumentation meeting, Hanford Atomic Products Operation, August 17 and 18, 1959, by C. L. Brown. General Electric Co. Hanford Atomic Products Operation, Richland, Wash. Sep 59. Contract W-31-109-Eng-52. 13p. Order from LC. Mi $2.40, ph $3.30. HW-61931

Effect of neutron interaction on critical size, by J. W. Webster. Phillips Petroleum Co., Atomic Energy Div., Idaho Falls, Idaho. Nov 54. Decl. Mar 4, 1960. Contract AT(10-1)-205. 22p. Order from OTS. 30 cents. IDO-16201

Critical data for nuclear safety guidance, by H. C. Paxton. University of California. Los Alamos Scientific Laboratory, Los Alamos, N. Mex. Feb 60. Contract W-7405-ENG-36. 68p. Order from OTS. $2.00. LAMS-2415

Power densities and flux distributions in two special subassemblies, by P. G. Roll. Westinghouse Electric Corp. Atomic Power Div., Pittsburgh, Pa. May 55. Decl. with deletions Mar 8, 1957. 11p. Order from LC. Mi $2.40, ph $3.30. WAPD-P-661(Del.)

Multi-region reactor lattice studies. Quarterly progress report covering period January 1 to March 31, 1960, by I. H. Coen. Westinghouse Electric Corp., Atomic Power Dept., Pittsburgh, Pa. Apr 60. Contract AT(30-1)-2176. 36p. Order from OTS. 75 cents. WCAP-1414

Criticality review of process for fabrication of fuel rods, by J. D. McLendon and J. W. Morfitt. Carbide and Carbon Chemicals Co. Y-12 Plant, Oak Ridge, Tenn. Jan 53. Decl. with deletions May 7, 1957. Contract W-7405-eng-26. 6p. Order from LC. Mi $1.80, ph $1.80. Y-A2-104 (Del.)

Equipment, Methods and Techniques

Hydraulic characteristics of a continuous solvent washer with critically safe dimensions, by H. J. Clark, Jr. and A. Tournas. E. I. du Pont de Nemours & Co. Explosives Dept., Atomic Energy Div., Technical Div., Savannah River Lab., Aiken, S. C. Mar 60. Contract AT(07-2)-1. 11p. Order from OTS. 50 cents. DP-459

Technical investigation of autoclave failure, by N. G. Wittenbrock, and others. General Electric Co., Hanford Atomic Products Operation, Richland, Wash. Nov 59. Contract AT(45-1)-1350. 37p. Order from LC. Mi $3.30, ph $7.80. HW-62715

Geology and Mineralogy

Cyclic pressure tests of large size pressure vessels. Progress report no. 12, by M. M. Lemcoe. Southwest Research Inst., San Antonio, Tex. Oct 59. Contract AT(30-1)-2140. 83p. Order from LC. Mi $4.80, ph $13.80. AECU-4481

Uranium occurrence at the crescent mine, Shoshone County, Idaho, by H. W. Norman. Salt Lake Branch Office, AEC. Grand Junction Operations Office, Salt Lake City, Utah. Dec 58. 18p. Order from OTS. 75 cents. RME-2020(Rev.)

Some uranium occurrences in northern Ferry County, Washington, by J. L. Barlow. Production Evaluation Div., Grand Junction Operations Office, AEC. Salt Lake City, Utah. Oct 58. 22p. Order from OTS. 75 cents. RME-2068

Atmospheric density profiles to 100 kilometers, by B. N. Charles. Sandia Corp., Albuquerque, N. Mex. Nov 59. 9p. Order from LC. Mi $1.80, ph $1.80. SCTM-368-59(51)

Geologic investigations of radioactive deposits. Semiannual progress report for June 1 to November 30, 1959, by W. P. Puffett and others. Geological Survey, Washington, D. C. Dec 59. 123p. Order from OTS. $2.75. TEI-752

Health and Safety

Experimental evaluation of the radiation protection afforded by typical Oak Ridge homes against distributed sources, by T. D. Strickler and J. A. Auxier. Oak Ridge National Laboratory, Oak Ridge, Tenn. Jan 60. 51p. Order from OTS. 50 cents. CEX-59.13

Radiation hazards from recycled reactor fuel, by E. D. Arnold. Oak Ridge National Laboratory, Oak Ridge, Tenn. June 59. 17p. Order from LC. Mi $2.40, ph $3.30. CF-59-6-39

Criticality accident application of the ORNL badge dosimeter, by E. D. Gupton and others. Oak Ridge National Laboratory, Oak Ridge, Tenn. Oct 59. 20p. Order from LC. Mi $2.40, ph $3.30. CF-59-10-41

The sequential analysis of ten nuclides occurring in long range fallout debris, by G. A. Welford and others. New York Operations Office. Haalth and Safety Lab., AEC. N. Y. Mar 59. 43p. Order from LC. Mi $3.30, ph $7.80. HASL-57

Radiobiological studies of the Columbia River through December 1955, by J. J. Davis and others. General Electric Co. Hanford Atomic Products Operation, Richland, Wash. Nov 56. Decl. with deletions July 31, 1959. Contract W-31-109-Eng-52. 177p. Order from LC. Mi $8.70, ph $30.30. HW-36074 (Del.)

Beta field dose rate determination with the C. P. dose rate meter, by I. C. Nelson. General Electric Co. Hanford Atomic Products Operation, Richland, Wash. Jan 56. Contract W-31-109-E Eng-52. 14p. Order from LC. Mi $2.40, ph $3.30. HW-40809

Evaluation of buried conduits as personnel shelters. Preliminary report, by G. H. Albright. Bureau of Yards and Docks. Office of the Chief of Civil Engineers, Washington, D. C. Nov 57. Decl. July 9, 1959. 76p. Order from LC. Mi $3.90, ph $10.80. ITR-1421

Radioactivity in environmental air at Los Alamos, New Mexico for the period November 17, 1958 through December 31, 1959, by J. W. Aeby and others. Jan 60. Contract W-7405-ENG-36. 22p. Order from OTS. 75 cents. LAMS-2397

Accumulation and movement of fission products in soils and plants. Quarterly report for period January through March 1957. Department of Agriculture. Soil and Water Conservation Research Div., Beltsville, Md. Apr 57. 9p. Order from LC. Mi $1.80, ph $1.80. M-7105

Report for 1959. Oak Ridge Institute of Nuclear Studies, Medical Division, by M. Brucer and others. Oak Ridge, Tenn. [1959] Contract AT-40-1-Gen-33. 81p. Order from OTS. $2.00. ORINS-34

An approximation of radiation dose resulting from an accidental release of tritium gas, by H. L. Rarrick and G. E. Tucker, Jr. Sandia Corp., Albuquerque, N. Mex. Dec 59. 5p. Order from LC. Mi $1.80, ph $1.80. SCTM-406-59-(33)

Radioactive fallout. A bibliography of selected United States Atomic Energy Commission reports, by H. E. Voress and others. AEC Technical Information Service Extension, Oak Ridge, Tenn. Aug 59. 74p. Order from OTS. $2.25. TID-3087

Radiation protection standards. A literature search, by W. E. Bost. AEC Technical Information Service Extension, Oak Ridge, Tenn. Apr 60. 28p. Order from OTS. 75 cents. TID-3551

Shipping and storage of radioactive materials. A literature search, T. F. Davis. AEC Technical Information Service Extension, Oak Ridge, Tenn. Apr 60. 20p. Order from OTS. 75 cents. TID-5748

A study of the possible relationship between radioactivity and toxicity in fishes from the central Pacific, by P. Helfrich. University of Hawaii, Marine Biology Laboratory, Honolulu, Hawaii. May 60. Contract AT(04-3)-235. 16p. Order from OTS. 50 cents. TID-5748

A compendium of information for use in controlling radiation emergencies. Including lecture notes from a training session at Idaho Falls, Idaho, by A. Brodsky and G. V. Beard. AEC Technical Information Service Extension, Oak Ridge, Tenn. Feb 60. 98p. Order from OTS. $1.00. TID-8206

The control of beryllium hazards, by C. L. Lindeken and O. L. Meadors. University of California. Lawrence Radiation Lab., Livermore, Calif. July 59. Contract W-7405-eng-48. 23p. Order from LC. Mi $2.70, ph $4.80. UCRL-5593

Penetration into concrete of gamma radiation from fallout, by W. F. Titus. Federal Civil Defense Administration, Battle Creek, Mich. Apr 60. 28p. Order from OTS. 75 cents. WT-1477

The internal environment of underground structures subjected to nuclear blast. II. Effects on mice located in heavy concrete shelters, by D. R. Richmond and others. Lovelace Foundation for Medical Education and Research, Albuquerque, N. Mex. Sep 59. 25p. Order from OTS. 50 cents. WT-1507

Instruments

Periodic interclaibration of temperature sensing elements. Section I. First performance. Duquesne Light Co., Shippingport, Pa. Nov 59. 24p. Order from LC. Mi $2.40, ph $4.80. AECU-4514

Servomechanisms with force feedback, by R. C. Arzbaecher. Argonne National Laboratory, Argonne, Ill. May 60. Contract W-31-109-eng-38. 119p. Order from OTS. $2.50. ANL-6157

An automatic gas chromatograph for monitoring of reactor fuel failures. Part I. Design, by W. R. Kritz. E. I. du Pont de Nemours & Co. Explosives Dept. Atomic Energy Div., Technical Div., Savannah River Laboratory, Aiken, S. C. Apr 59. Contract AT(07-2)-1. 10p. Order from OTS. 50 cents. DP-356

A versatile recording potentiometer, by C. O. Ballou. E. I. du Pont de Nemours & Co. Explosives Dept., Atomic Energy Div., Technical Div., Savannah River Laboratory, Aiken, S. C. Feb 60. Contract AT(07-2)-1. 19p. Order from OTS. 75 cents. DP-441

A colorimeter for in-line analysis of uranium and plutonium solutions, by D. W. Colvin. E. I. du Pont de Nemours & Co. Explosives Dept., Atomic Energy Div., Technical Div., Savannah River Laboratory, Aiken, S. C. Mar 60. Contract AT(07-2)-1. 23p. Order from OTS. 75 cents. DP-461

A level indicator for liquified gases, by A. L. Burke and L. H. Cook, Jr. E. I. du Pont de Nemours & Co. Explosives Dept., Atomic Energy Div., Technical Div., Savannah River Laboratory, Aiken, S. C. Mar 60. Contract AT(07-2)-1. 8p. Order from OTS. 50 cents. DP-469

Rear face monitoring by television. Final report, by W. J. Morris. Hanford Works, Richland, Wash. Apr 53. Decl. March 21, 1960. Contract W-31-109-Eng-52. 30p. Order from OTS. 30 cents. HW-27544

In-line alpha monitor prototype performance, by N. T. Hildreth. General Electric Co. Hanford Atomic Products Operation, Richland, Wash. Oct 55. Decl. November 23, 1959. Contract W-31-109-Eng-52. 31p. Order from LC. Mi $3.00, ph $6.30. HW-37272

Scratch depth measurement methods, by B. B. Brenden. General Electric Co. Hanford Atomic Products Operation, Richland, Wash. Feb 59. Contract AT(45-1)-1350. 12p. Order from LC. Mi $2.40, ph $3.30. HW-59410

High-speed saw tests. Power reactor fuels reprocessing development, by V. P. Kelly. General Electric Co. Hanford Atomic Products Operation, Richland, Wash. Nov 59. Contract AT(45-1)-

1350. 15p. Order from LC. Mi $2.40, ph $3.30. HW-62490

Nuclear process instrumentation and controls conference held in Gatlinburg, Tennessee, May 20-22, 1958, by C. J. Borkowski and others. Oak Ridge National Laboratory. Instrumentation and Control Div., Oak Ridge, Tenn. [nd.] 323p. Order from OTS. $5.00. ORNL-2695

Level transducers for liquid metals, by R. G. Affel, G. H. Burger, and R. E. Pidgeon. Oak Ridge National Laboratory. Instrumentation and Controls Div., Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 43p. Order from OTS. $1.50. ORNL-2792

Development of photomultiplier tubes. Report no. 30 for November 1, 1958 to August 15, 1959, by W. A. Snell and Y. C. Kim. DuMont (Allen B.) Labs., Inc., Electronic Tube Div., Clifton, N. J. [1959]. Contract AT(30-1)-1336. 30p. Order from LC. Mi $2.70, ph $4.80. RIB-41

Evaluation of plated-through connections for printed circuit boards, by G. Voida and N. J. Eich. Sandia Corporation, Technical Information Div., Albuquerque, N. Mex. Apr 60. 34p. Order from OTS. $1.00. SCR-167

Krytron tubes - Applications and performance requirements, by A. F. Hurford. Sandia Corporation, Technical Information Div., Albuquerque, N. Mex. Apr 60. 11p. Order from OTS. 50 cents. SCR-174

Automatic recording unit, by F. A. Ross. Sandia Corporation, Albuquerque, N. Mex. Mar 60. 22p. Order from OTS. 75 cents. SCTM-114-60-24

The theory and design of the triggered spark gap, by T. J. Williams. Sandia Corporation, Albuquerque, N. Mex. May 59. 179p. Order from OTS. $3.00. SCTM-186-59-(14)

A photoetching technique for the precision fabrication of waveguide antenna arrays, by R. J. Bittner and E. J. Wilkinson. Sandia Corporation, Albuquerque, N. Mex. Sep 59. Changed from OFFICIAL USE ONLY April 1, 1955. 20p. Order from LC. Mi $2.40, ph $3.30. SC-2974 (TR)

An application of correlation detection to electronic trajectory measurement, by B. J. Weston. Sandia Corporation, Albuquerque, N. Mex. Apr 58. 9p. Order from LC. Mi $1.80, ph $1.80. SCDC-727

Reliability in electronic equipment, by F. J. Given. Sandia Corporation, Albuquerque, N. Mex. June 54. 11p. Order from LC. Mi $2.40, ph $3.30. SCTM-60-54-53

High voltage mercury switch pulse generator, by F. M. McIver. Sandia Corporation, Albuquerque, N. Mex. Dec 55. 7p. Order from LC. Mi $1.80, ph $1.80. SCTM-156-55(51)

Transistorized microphone preamplifier PA-1, by M. H. Brock. Sandia Corporation, Albuquerque, N. Mex. Apr 59. 10p. Order from LC. Mi $1.80, ph $1.80. SCTM-163-59(52)

Automatic test equipment used in testing thermal batteries in the nonactivated state, by F. H. Darugh. Sandia Corporation, Albuquerque, N. Mex. Aug 55. Changed from OFFICIAL USE ONLY October 21, 1959. 22p. Order from LC. Mi $2.70, ph $4.80. SCTM-172-55-53

A saturated slat solution hygrometer calibration system, by J. L. Chamberlin. Sandia Corporation, Albuquerque, N. Mex. Dec 59. 7p. Order from LC. Mi $1.80, ph $1.80. SCTM-295-59(16)

The T-antenna: Current and impedance, by R. W. P. King and C. W. Harrison, Jr. Sandia Corporation, Albuquerque, N. Mex. Sep 59. 37p. Order from LC. Mi $3.00, ph $6.30. SCTM-306-59(14)

Temperature-measuring thermistors for 5-volt telemetering systems. Sandia Corporation, Albuquerque, N. Mex. Oct 59. 11p. Order from LC. Mi $2.40, ph $3.30. SCTM-342-59(52)

The inverted L-antenna: Current and impedance, R. W. P. King and C. W. Harrison, Jr. Sandia Corporation, Albuquerque, N. Mex. Nov 59. 14p. Order from LC. Mi $2.40, ph $3.30. SCTM-353-59(14)

Nuclear instrumentation. A literature search, by H. D. Raleigh and R. L. Scott. AEC Technical Information Service Service Extension, Oak Ridge, Tenn. Apr 60. 108p. Order from OTS. $2.25. TID-3550

An improved gamma detector using gamma moderation, by R. Fox. University of California. Lawrence Radiation Lab., Livermore, Calif. Sep 59. Contract W-7405-eng-48. 17p. Order from LC. Mi $2.40, ph $3.30. UCRL-5605

The theory and operation of shock-loaded ferroelectric transducers, by M. T. Abegg and others. University of California. Lawrence Radiation Lab., Livermore, Calif. Nov 59. Contract W-7405-eng-48. 43p. Order from LC. Mi $3.30, ph $7.80. UCRL-5772-T

Soft x-ray detection system, by F. J. Lombard, A. Stripeika and R. S. White. University of California. Lawrence Radiation Laboratory, Livermore, Calif. Dec 59. Contract W-7405-eng-48. 19p. Order from OTS. 75 cents. UCRL-5854

Nuclear materials control system (NMCS). Phase II. A gamma-ray scanner for safeguards use, by C. C. Webster. Westinghouse Electric Corp. Atomic Power Dept., Pittsburgh, Pa. Oct 59. Contract AT(30-1)-2176, Task I. 28p. Order from LC. Mi $2.70, ph $4.80. WCAP-6030

Metallurgy and Ceramics

High temperature corrosion study interim report for the period November 1958 through May 59, by C. F. Hale and others. Oak Ridge Gaseous Diffusion Palnt Oak Ridge, Tenn. July 59. 38p. Order from OTS. $1.25. AECD-4292

Quantitative correlation of irradiation growth with preferred orientation in uranium, by W. R. McDonell. E. I. du Pont de Nemours & Co. Explosives Dept., Atomic Energy Div., Technical Div., Savannah River Laboratory, Aiken, S. C. May 60. Contract AT(07-2)-1. 27p. Order from OTS. $1.00. DP-420

A preliminary study of the mechanical properties of M-257, and aluminum-aluminum oxide alloy, by D. E. Johnson and D. A. Patterson. General Electric Co. Hanford Atomic Products Operation, Richland, Wash. Mar 57. 13p. Order from LC. Mi $2.40, ph $3.30. HW-47883

A microspark apparatus for the study of inclusions in metals, by F. M. Smith. General Electric Co. Hanford Atomic Products Operation, Richland, Wash. July 59. Contract AT(45-1)-1350. 10p. Order from LC. Mi $1.80, ph $1.80. HW-61187

Filtering abrasive-wheel uranium cuttings, by A. K. Postma and J. D. McCormack. General Electric Co. Hanford Atomic Products Operation, Richland, Wash. Sep 59. Contract AT(45-1)-1350. 9p. Order from LC. Mi $1.80, ph $1.80. HW-61917

Test of water velocity on pitting of 72-S aluminum, by W. C. Houck. Hanford Works, Richland, Wash. Mar 53. Decl. November 23, 1959. Contract W-31-109-Eng-52. 4p. Order from LC. Mi $1.80, ph $1.80. HW-27198

Pyrophoricity of uranium in reactor environments, by G. E. Zima. Hanford Atomic Products Operation, Richland, Wash. Jan 60. Contract AT (45-1)-1350. 71p. Order from OTS. 80 cents. HW-62442

Release of inert gases from irradiated uranium. A review of the literature, by D. L. Gray. Hanford Atomic Products Operation, Richland, Wash. Jan 60. Contract AT(45-1)-1350. 21p. Order from OTS. 75 cents. HW-62639

Research report in metallurgy. Annual summary for July 1958 through June 1959, by Ames Laboratory Staff. Iowa State University of Science and Technology, Ames Laboratory, Iowa City, Iowa. Nov 59. Contract W-7405-eng-82. 133p. Order from OTS. $2.75. IS-17

A study of the high-temperature air oxidation of yttrium metal, by O. N. Carlson, F. A. Schmidt and R. L. Wells. Iowa State University of Science and Technology, Ames Laboratory, Iowa City, Iowa. Mar 60. Contract W-7405-eng-82. 32p. Order from OTS. $1.00. IS-117

Effect of heat-treatment on the corrosion of zirconium - 2 At.% tin - 2 At.% niobium, by D. L. Douglass and B. E. Dearing. General Electric Co. Knolls Atomic Power Laboratory, Schenectady, N. Y. Jan 60. Contract W-31-109-Eng-52. 13p. Order from OTS. 50 cents. KAPL-2071

Rate of alloying of uranium alloys with stainless steel (Part I. 1800 to 2300°F), by R. S. Neymark. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. Jun 60. Contract AT(11-1)-GEN-8. 31p. Order from OTS. $1.00. NAA-SR-3278

Development of ferritic steels for high temperature sodium service. Part I: 2.25 CR - 1 Mo - 0.4 Cb - 0.4 Ti experimental alloy, by W. C. Hayes and A. J. Birkle. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. May 60. Contract AT (11-1)-GEN-8. 38p. Order from OTS. $1.25. NAA-SR-4832

Separation of uranium from thorium by liquid metal extraction interim report, by F. W. Dodge, J. D. Chilton and L. A. Hanson. Atomics International. A Division of North American Aviation Inc., Canoga Park, Calif. May 60. Contract AT(11-1)-GEN-8. 24p. Order from OTS. 75 cents. NAA-SR-4942

The preparation and properties of dispersion hardened uranium powder products. Quarterly Technical report for period ending March 31, 1959, by W. Arbiter. Nuclear Development Corp. of America, White Plains, N. Y. Apr 59. Contract AT(30-1)-2303. 33p. Order from LC. Mi $3.00, ph $6.30. NDA-2112-1

Conceptual design and economic study uranium sponge fuel development, by G. A. Sofer and M. Raber. Nuclear Development Corporation of America, White Plains, N. Y. Jan 60. Contract AT(30-1)-2303. 52p. Order from OTS. $.50. NDA-2116-4

Corrosion of zirconium alloys in 900 and 1000°F steam, by J. P. Pemsler. Nuclear Metals, Inc., Concord, Mass. Mar 60. Contract AT(30-1)-1565. 25p. Order from OTS. 50 cents. NMI-1235

Aqueous corrosion of thorium alloys and Zircaloy-clad thorium alloys, by D. S. Kneppel. Nuclear Metals, Inc., Concord, Mass. Mar 60. Contract AT(30-1)-1565. 49p. Order from OTS. $1.25. NMI-1226

Stress-rupture properties of beryllium containing carbide and oxide dispersions, by J. Greenspan. Nuclear Metals, Inc., Concord, Mass. Mar 60. Contract AT(30-1)-1565. 23p. Order from OTS. 50 cents. NMI-1227

Yttrium fabrication, by E. S. Guidoboni, A. M. Huntress and P. Loewstein. Nuclear Metals, Inc., Concord, Mass. Oct 59. Contract AT (30-1)-1565. 58p. Order from OTS. $1.50. NMI-1228

The fabrication of clad massive UO_2 fuel elements by coextrusion. Second quarterly report, by F. S. Gardner and J. C. Hunt. Nuclear Metals, Inc., Concord, Mass. Jan 60. Contract AT(30-1)-1565. 35p. Order from OTS. $1.00. NMI-2505

Monthly letter report no. 8 covering period from June 15 to July 15, 1959, by J. D. Fleming. Georgia Inst. of Tech., Engineering Experiment Station, Atlanta, Ga. July 59. Contract AT(40-1)-2488. 7p. Order from LC. Mi $2.40, ph $3.30 ORO-223

Summary report - Phase I: Graphite-matrix nuclear fuel elements. Volume I, by R. B. Wrinkle and others. National Carbon Co., Division of Union Carbide Corp., Cleveland, Ohio. Dec 59. Contract AT(40-1)-2560. 128p. Order from OTS. $2.75. ORO-240

Progress report, foundry metallurgy studies, by L. P. Wilson. Sandia Corporation, Albuquerque, N. Mex. Apr 60. 11p. Order from OTS. 50 cents. SCDR-43-60

Quarterly technical progress report for period ending December 31, 1959, by J. L. Zambrow. Sylvania-Corning Nuclear Corporation, Bayside, Long Island, N. Y. Feb 60. Contract AT-30-1-Gen-366. 23p. Order from OTS. 50 cents. SCNC-306

Dimensional instability of uranium-IV. Final progress report for July 1, 1958 through March 31, 1959, by R. Resnick, L. S. Castleman and L. Seigle. Sylvania Research Laboratories, Sylvania Electric Products Inc., Bayside, Long Island, N. Y. Feb 60. Contract AT-30-1-Gen-366. 26p. Order from OTS. 50 cents. SEP-255

The formation and statistical evaluation of "diffusion bonded" brazed joints in Yankee fuel subassemblies, by P. P. King. Atomic Power Dept., Westinghouse Electric Corporation, Pittsburgh, Pa. Nov 59. Contract AT(30-3)-222. 34p. Order from OTS. $1.00. YAEC-160

Particle Accelerators and High-Voltage Machines

Bevatron operation and development. XXIII August, September, October, 1959, by W. D. Hartsough. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. Mar 60. Contract W-7405-eng-48. 16p. Order from OTS. 75 cents. UCRL-9058

Linac injection for the 340-Mev Berkeley electron synchrotron: Part II - Experimental, by K. C. Crebbin and W. L. Everette. University of California, Lawrence Radiation Laboratory, Berkeley, Calif. Feb 60. Contract W-7405-eng-48. 21p. Order from OTS. 75 cents. UCRL-9103

Physics and Mathematics

Fortran programming techniques for graph plotting on the IBM-704 computer, by C. E. Cohn. Argonne National Laboratory, Argonne, Ill. May 60. Contract W-31-109-eng-38. 19p. Order from OTS. 50 cents. ANL-6161

The diffusion of radioactive fission products from porous fuel elements, by S. D. Beck. Battelle Memorial Institute, Columbus, Ohio. Apr 60. Contract W-7405-eng-92. 25p. Order from OTS. $1.00. BMI-1433

Neutron flux distributions in natural uranium tubes, by T. B. Ponder. E. I. du Pont de Nemours & Co. Explosives Dept., Atomic Energy Div., Technical Div., Savannah River Laboratory, Aiken, S. C. Mar 60. Contract AT(07-2)-1. 28p. Order from OTS. $1.00. DP-467

A statistical technique for predicting a two dimensional vector with application, by R. E. Vogel. University of California. Los Alamos Scientific Laboratory, Los Alamos, N. Mex. May 60. Contract W-7405-ENG-36. 84p. Order from OTS. $2.25. LA-2380

Space, energy, and time distribution of neutrons at the ground-air interface. Calculated by Monte Carlo Code NHM, by W. A. Biggers, L. J. Brown, and K. C. Kohr. University of California Los Alamos Scientific Laboratory, Los Alamos, N. Mex. Jan 60. Contract W-7405-ENG-36. 173p. Order from OTS. $3.00. LA-2390

The thermal expansion of plutonium metal below 300°K, by T. A. Sandenaw. University of California. Los Alamos Scientific Laboratory, Los Alamos, N. Mex. May 60. Contract W-7405-ENG-36. 23p. Order from OTS. 75 cents. LA-2394

Collective oxtupole vibrations of deformed nuclei, by J. J. Griffin and L. Wilets. University of California. Los Alamos Scientific Laboratory, Los Alamos, N. Mex. June 60. Contract W-7405-ENG-36. 32p. Order from OTS. $1.00. LAMS-2389

A summary of nuclear calculations for the organic moderated reactor experiment (OMRE), by R. O. Williams, Jr. and R. F. Wilson. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. May 60. Contract AT(11-1)-GEN-8. 84p. Order from OTS. $2.25. NAA-SR-4066

A new method for determining the stability of two-phase flow in parallel heated channels with applications to nuclear reactors, by J. H. Bick. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. May 60. Contract AT(11-1)-GEN-8. 15p. Order from OTS. 50 cents. NAA-SR-4927

Focusing properties of inhomogeneous magnetic sector fields, by M. M. Bretscher. Oak Ridge National Laboratory, Analytical Chemistry Division, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 49p. Order from OTS. 75 cents. ORNL-2884

Mathematics panel progress report for period September 1, 1958 to December 31, 1959, by A. S. Householder. Oak Ridge National Laboratory, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 39p. Order from OTS. $1.25. ORNL-2915

High-explosive ditching from linear charges. Interim report, project Toboggan, Phase I, by R. H. Carlson. Sandia Corporation, Albuquerque, N. Mex. 57p. Order from OTS. $1.75. SC-4441(RR)

Interactions of antiprotons in hydrogen, beryllium, and carbon. Thesis, by B. Cork. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. Mar 60. Contract W-7405-eng-48. 48p. Order from OTS. $1.50. UCRL-8746

Antiproton-proton cross sections at 1.0, 1.25, and 2.0 Bev. Thesis, by C. A. Coombes. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. Mar 60. Contract W-7405-eng-48. 51p. Order from OTS. $1.50. UCRL-8865

Charge-exchange scattering of negative pions by hydrogen at 230, 260, 290, 317, and 371 Mev. Thesis, by J. C. Caris. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. Mar 60. Contract W-7405-eng-48. 105p. Order from OTS. $2.50. UCRL-9048

Range-energy relation for heavy ions in metals, by E. L. Hubbard. University of California.

Lawrence Radiation Laboratory, Berkeley, Calif. Jan 60. Contract W-7405-eng-48. 26p. Order from OTS. 75 cents. UCRL-9053

Table of the incomplete gamma function, by J. R. Walton, T. Sikkeland, A. Ghiorso, and G. T. Seaborg. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. Mar 60. Contract W-7405-eng-48. 25p. Order from OTS. 75 cents. UCRL-9107

The elastic scattering of negative pions by protons at 230, 290, 370, and 427 Mev. Thesis, by L. K. Goodwin. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. Apr 60. Contract W-7405-eng-48. 84p. Order from OTS. $2.25. UCRL-9119

The nuclear spins and moments of several radioactive gallium isotopes. Thesis, by V. J. Ehlers. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. Mar 60. Contract W-7405-eng-48. 115p. Order from OTS. $2.50. UCRL-9123

The rubidium-85-rubidium-86 hyperfine-structure anomaly. Thesis, by N. Braslau. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. Mar 60. Contract W-7405-eng-48. 150p. Order from OTS. $3.00. UCRL-9130

Radiation Effects on Materials

Irradiation-capsule study of uranium monocarbide, by R. B. Price and others. Battelle Memorial Institute, Columbus, Ohio. Mar 60. Contract W-7405-eng-92. 38p. Order from OTS. 75 cents. BMI-1425

Radiation damage conference, March 23-24, 1953. Part I, by F. E. Faris and others. Oak Ridge National Laboratory. Oak Ridge, Tenn. Dec 54. Decl. with deletions August 10, 1959. Contract W-7405-eng-26. 219p. Order from OTS. CF-53-276(Pt. 1) (Del.)

Radiation damage conference, March 23-24, 1953. Part II, byL. F. Coffin, Jr. and others. Oak Ridge National Laboratory, Oak Ridge, Tenn. Jan 55. Decl. with deletions August 10, 1959. Contract W-7405-eng-26. 252p. Order from OTS. This report consists of 2 parts, total price $6.00. CF-53-3-276(Pt. 11)(Del.)

Irradiation effects on the surface reactions on metals metals, Summary report for October 1, 1958 to November 1, 1959, by J. L. White and others. General Dynamics Corporation, General Atomic Division, San Diego, Calif. Dec 59. Contract AT(04-3)-179. 39p. Order from OTS. $1.00. GA-1093

Proceedings of the lattice deffects in noble metals conference, held at Canoga Park, California on October 16 and 17, 1958, by J. A. Brinkman, C. J. Meechan and A. Sosin. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. [1958]. Contract AT(11-1)-GEN-8. 127p. Order from OTS. $1.25. NAA-SR-3250

Radiation effects. Bibliography, by Radiation Effects Division. Sandia Corporation, Albuquerque, N. Mex. Dec 59. 610p. Order from OTS. $8.00. SCR-140

Radioactive Waste

Liquid waste disposal in the vicinity of the Idaho Chemical Processing Plant (ICPP). Interim report, by B. L. Schmalz. Idaho Operations Office, Health and Safety Div., Idaho Falls, Idaho. June 59. 29p. Order from LC. Mi $2.70, ph $4.80. IDO-12011

Removal of radioiodine from air streams by activated charcoal, by R. E. Adams and W. E. Browning, Jr. Oak Ridge National Laboratory, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 11p. Order from OTS. 50 cents. ORNL-2872

Reactors—General

Thermal shock tests of a plate-type nuclear superheater fuel element design, by R. J. Gariboldi. Argonne National Laboratory, Reactor Engineering Division, Argonne, Ill. Mar 60. Contract W-31-109-eng-38. 14p. Order from OTS. 50 cents. ANL-6086

Some steady-state thermal characteristics of a three-loop reactor power system, by T. R. Bump and H. O. Monson. Argonne National Laboratory, Reactor Engineering Division, Argonne, Ill. Mar 60. Contract W-31-109-eng-38. 22p. Order from OTS. 75 cents. ANL-6137

A preliminary design study of a boiling slurry reactor experiment, by M. Petrick and J. F. Marchaterre. Argonne National Laboratory, Argonne, Ill. Apr 60. Contract W-31-109-eng-38. 39p. Order from OTS. $1.25. ANL-6148

Sodium components test facility. Atomic Power Development Associates, Inc. Detroit, Mich. Nov 59. Contract AT(11-1)-772. 208p. Order from OTS. $3.50. APDA-134

Metal-water reactions: VI. Analytical formulations for the reaction rate, by L. F. Epstein. General Electric Co. Vallecitos Atomic Laboratory, Atomic Power Equipment Dept., Pleasanton, Calif. Sep 59. Contract AT(04-3)-189. 52p. Order from OTS. $1.50. GEAP-3272

Plutonium recycle test reactor - Final safeguards analysis. Supplement I: Additional studies, by N. G. Wittenbrock and others. Hanford Atomic Poroducts Operation, Richland, Wash. Apr 60. AT(45-1)-1350. 29p. Order from OTS. $1.25. HW-61236 SUP 1

Experimental and analytical studies of reflector control for the advanced engineering test reactor. Part A, by W. S. Delicate, M. J. Kornfeld, and A. M. Larson. Part B, by P. C. Bertelson, and T. L. Francis. Internuclear Company, Inc., Clayton, Mo. Oct 59. Contract AT(11-1)-688. 256p. Order from OTS. $4.00. INTERNUC-47(Pts. A and B)

Thermal cycling and leakage tests of 12-inch valves for sodium service, by C. J. Baroczy. Atomics International. A Division of North American Aviation, Inc., Canoga Park. Calif. May 60. Contract AT(11-1)-GEN-8. 50p. Order from OTS. $1.00. NAA-SR-4947

Reactors—Power

Pathfinder Atomic Power Plant. Coolant distribution tests. Final report, by J. Wilson and R. Styles. Atomic Energy Division, Allis-Chalmers Manufacturing Co., Milwaukee, Wis. Nov 59. Contract AT(11-1)-589. 18p. Order from OTS. 75 cents. ACNP-5920

Pathfinder Atomic Power Plant technical progress report for July 1, 1959 through September 30, 1959, by O. Burgreen and others. Atomic Energy Division, Allis-Chalmers Manufacturing Co., Milwaukee, Wis. Nov 59. Contract AT(11-1)-589. 121p. Order from OTS. $2.75. ACNP-5924

Pathfinder Atomic Power Plant conceptual design study of CRBR quick-operating pressure vessel closure and self-energizing seal tests. Final report, by R. G. Michel. Atomic Energy Div., Allis-Chalmers Manufacturing Co., Milwaukee, Wis. Oct 59. Contract AT(11-1)-589. 155p. Order from OTS. $3.00. ACNP-5922

Nuclear prototype power plant installation in merchant ships. Ford Instrument Co., Division of Sperry Rand Corporation and Maryland Shipbuilding & Drydock Company. [nd.] Contract MA-1893. 191p. Order from OTS. $3.00. FICo -112

Army gas-cooled raactor systems program. Semiannual progress report for 1 July through 31 December 1959, by G. A. Linenberger. Aerojet-General Nucleonics, The Military Projects Division, San Ramon, Calif. Feb 60. Contract AT(10-1)-880. 158p. Order from OTS. $5.40. IDO-28549

Design considerations for a plasma thermocouple reactor, by B. E. Watt. University of California. Los Alamos Scientific Laboratory, Los Alamos, N. Mex. May 60. Contract W-7405-ENG-36. 24p. Order from OTS. $1.00. LAMS-2386

Quarterly status report of the LASL plasma thermocouple development program for period ending March 20, 1960, by S. Glasstone. University of California. Loa Alamos Scientific Laboratory, Los Alamos, Calif. May 60. Contract W-7405-ENG-36. 18p. Order from OTS. 75 cents. LAMS-2423

PM-1 Nuclear Power Plant Program. 2nd quarterly progress report for 1 June to 31 August 1959, by J. S. Sieg and others. Martin Company, Nuclear Division, Baltimore, Md. Oct 59. Contract AT(30-1)-2345. 212p. Order from OTS. $4.00. MND-M-1813

OMRE fuel removal and shipping equipment, by P. J. Mallon, D. S. Duncan and R. C. Noyes. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. Apr 60. Contract AT(11-1)-GEN-8. 48p. Order from OTS. $1.25. NAA-SR-3337

An advanced sodium-graphite reactor nuclear power plant, by J. R. Churchill and J. Renard. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. Mar 60. Contract AT(11-1)-GEN-8. 162p. Order from OTS. $3.00. NAA-SR-3829

Natural uranium sodium-deuterium reactors. (Preliminary design and economic analysis), by L. Joseph, G. Sofer and L. Goldstein. Nuclear Development Corporation of America, White Plains, N. Y. Feb 59. Contract AT(30-3)-256. 235p. Order from OTS. $3.50. NDA-84-15

Experimental molten-salt-fueled 30-Mw power reactor, by L. C. Alexander and others. Oak Ridge National Laboratory, Reactor Project Division, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 32p. Order from OTS. $1.25. ORNL-2796

Environmental analysis of NS "Savannah" operation at Camden, by W. B. Cottrell and others. Oak Ridge National Laboratory, Reactor Projects Division, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 113p. Order from OTS. $2.75. ORNL-2867

Army package power reactor project annual progress report for period ending January 31, 1960. Oak Ridge National Laboratory, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 46p. Order from OTS. $1.50. ORNL-2907

Homogeneous reactor program quarterly progress report for period ending January 31, 1960, by R. B. Briggs and others. Oak Ridge National Laboratory, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 138p. Order from OTS. $3.00. ORNL-2920

Chemical shutdown system, by Z. M. Shapiro. Westinghouse Electric Corp., Atomic Power Div., Pittsburgh, Pa. Sep 54. Decl. with deletions April 29, 1957. Contract AT-11-1-GEN-14. 8p. Order from LC. Mi $1.80, ph $1.80. WAPD-C(PC)-23(Del.)

Pressurized water reactor (PWR) project. Technical progress report for the period February 24, 1960 to April 23, 1960, by P. N. Ross. Bettis Atomic Power Laboratory, Pittsburgh, Pa. [1960]. Contaact AT-11-1-GEN-14. 122p. Order from OTS. $2.50. WAPD-MRP-85

Cold start-up with a temperature coefficient initially positive, by W. R. Campbell. Westinghouse Electric Corp. Bettis Plant, Pittsburgh, Pa. Sep 56. Decl. with deletions May 9, 1957. Contract AT-11-1-GEN-14. 16p. Order from LC. Mi $2.40, ph $3.30. WAPD-TM-10(Del.)

Physics calculations for control rods in the first Yankee core, by W. H. Arnold, Jr. Westinghouse Electric Corp. Atomic Power Dept., Pittsburgh, Pa. Sep 59. Contract AT(30-3)-222. 47p. Order from OTS. $1.50. YAEC-62

Two-region critical experiments with water moderated slightly enriched UO_2 lattices, by P. W. Davison and others Westinghouse Electric Corporation, Atomic Power Dept., Pittsburgh, Pa. Nov 59. Contract AT(30-3)-222. 77p. Order from OTS. $2.25. YAEC-142

Quarterly progress report for the period July 1 to September 30, 1959, by H. E. Walchli. Westinghouse Electric Corporation, Atomic Power Dept., Pittsburgh, Pa. Nov 59. Contracr AT (30-3)-222. 61p. Order from OTS. $1.75. YAEC-169

Stable Isotope Separation

Radioisotopes in industry - Training program. Volume II, by J. P. Danforth and R. P. Stapp. General Motor Institute, Flint, Mich. 1959. 848p. Order by title and volume from OTS. $5.00.

A study of the feasibility and economics of radioisotope production in power reactors, by C. B. Magee and others. Booz·Allen Applied Research, Inc., Glenview, Ill. Feb 60. Contract AT (11-1)-736. 130p. Order from OTS. $2.45. AECU-4355

Determination of the liquid level in a steel cylinder by gamma absorption, by E. H. Daggett and others. Monsanto Chemical Company, Mound Laboratory, Miamisburg, Ohio. Apr 60. Contract AT-33-1-GEN-53. 16p. Order from OTS. MLM-1040

Isotope separation by gaseous diffusion and centrifugation. A literature search, by J. M. Jacobs. AEC Technical Information Service Extension, Oak Ridge, Tenn. May 60. 19p. Order from OTS. 50 cents. TID-3554

Technology—Feed Materials

The design of a denitration reactor for United States, Atomic Energy Commission, New York Operations Office. Klaw-Knox Construction Company, Chemical Plants Division, Pittsburgh, Pa. Jan 51. Decl. April 20, 1960. 60p. Order from OTS. 45 cents. BKC-3596

Estimated manufacturing costs for the recovery of thorium and uranium from monazite sand, by G. D. Calkins and R. B. Filbert, Jr. Battelle

Memorial Inst., Columbus, Ohio. Sep 50. Decl. November 20, 1959. Contract AT-30-1-Gen-228. 20p. Order from LC. Mi $2.40, ph $3.30. BMI-244

Topical report on refining of MgX and other uranium-bearing materials, by R. A. Ewing and others. Battelle Memorial Institute, Columbus, Ohio. Jan 51. Decl. April 20, 1960. Contract AT-30-1-Gen-228. 57p. Order from OTS. 50 cents. BMI-250

Identification of slag constituents from uranium metal production bombs, by D. A. Vaughan, G. G. Cocks, and C. M. Schwartz. Battelle Memorial Institute, Columbus, Ohio. Jan 52. Decl. December 15, 1959. Contract AT-30-1-Gen-228. 20p. Order from LC. Mi $2.40, ph $3.30. BMI-258

Identification of reaction products formed during magnesium reduction of uranium tetrafluoride, by C. M. Schwartz and D. A. Vaughan. Battelle Memorial Institute, Columbus, Ohio. May 53. Decl. April 14, 1960. Contract AT(30-1)-Gen-228. 16p. Order from OTS. 25 cents. BMI-266

FMPC solvent treatment area - Process design, by C. Pfeiffer and J. B. Maerker. Catalytic Construction Company, The Engineering Department, Philadelphia, Pa. July 51. Decl. April 20, 1960. 33p. Order from OTS. 35 cents. CCC)-229

Technical Data Book. Feed Materials Production Center, Fernald, Ohio, Part XXII, by F. W. Winn and others. Catalytic Construction Company, Philadelphia, Pa. Feb 53. Decl. April 13, 1960. Contract AT(30-1)-1060. 63p. Order from OTS. 50 cents. CCCO-598

Conversion of UNH to UO_2 - Terminal report, by R. F. Maness and F. Clagett. Hanford Atomic Products Operation, Richland, Wash. Jan 51. Decl. April 14, 1960. Contract W-31-109-Eng-52. 19p. Order from OTS. 30 cents. HW-19932

Uranium hexafluoride purification, by A. L. Allen, and E. W. Powell. Carbide and Carbon Chemicals Division, Union Carbide and Carbon Corp., K-25 Plant, Oak Ridge, Tenn. Mar 51. Decl. April 13, 1960, Contract W-7405-Eng-26. 11p. Order from OTS. 25 cent. K-739

Large scale tests of the aqueous hydrogen fluoride process for the production of uranium tetrafluoride, by G. J. Vogel. Carbide and Carbon Chemical Company. Union Carbide and Carbon Corp., K-25 Plant, Oak Ridge, Tenn. Oct 52. Decl. April 14, 1960. Contract W-7405-Eng-26. 15p. Order from OTS. 30 cents. K-966

A continuous process for converting uranium dioxide to uranium tetrafluoride using aqueous hydrogen fluoride, by S. D. Schiffman and H. H. Lett. Carbide and Carbon Chemicals Company, Union Carbide and Carbon Corporation, K-25 Plant, Oak Ridge, Tenn. Apr 53. Decl. April 13, 1960. Contract W-7405-Eng-26. 13p. Order from OTS. 25 cents. K-1008

Recovery of uranium hexafluoride from vent gages, by T. J. Mayo, W. R. Golliher, and W. R. Rossmassler. Union Carbide Nuclear Company, A Division of Union Carbide and Carbon Corp., Paducah Plant, Paducah, Ky. Dec 56. Decl. May 17, 1960. Contract W-7405-eng-26. 7p. Order from OTS. 20 cents. KY-197

Laboratory evaluation of crushed crown magnesium for uranium metal production, by S. W. Weidman and R. F. Leifield. Mallinckrodt Chemical Works, Uranium Division, Weldon Spring, Mo. May 60. Contract W-14-108-Eng-8. 25p. Order from OTS. 50 cents. MCW-1443

Process development quarterly progress report for January-March 1960, by J. H. Yeager and others. Mallinckrodt Chemical Works, Uranium Division, Weldon Spring, Mo. May 60. Contract W-14-108-Eng-8. 48p. Order from OTS. $1.50. MCW-1446

Electroreduction of uranium oxides to massive uranium metal, by R. D. Piper and R. F. Leifield. Mallinckrodt Chemical Works, Uranium Division, Weldon Spring, Mo. Apr 60. Changed from OFFICIAL USE ONLY June 3, 1960. Contract W-14-108-Eng-8. 17p. Order from OTS. 50 cents. MCW-1447

Pilot plant studies of slag liners, Section VII of the series, "Uranium metal by bomb reduction, by T. O. Anderson. Mallinckrodt Chemical Works, St. Louis, Mo. Nov 52. Decl. October 7, 1959. 34p. Order from LC. Mi $3.00, ph $6.30. NYO-1348

Sec. H

U. S. Government

RESEARCH REPORTS

September 16, 1960
Vol. 34, No. 3

. . . A monthly listing of Government research reports available to industry . . .

OF MICHIGAN

U. S. DEPARTMENT OF COMMERCE
BUSINESS AND DEFENSE SERVICES ADMINISTRATION
Office of Technical Services

In this issue:

High-temperature Insulation for Wire

Spray-in-place Shelters

Development of High Temperature Die Materials (Hot Die Materials)

The Explosive Working of Metals

Heat Transfer Efficiency of Automotive Engine Coolants

Methods and Controls for Producing Castable Dies for Forging Steel and Titanium Alloys

Investigation of Graphite Bodies

Materials Testing (1950-1960)

Cylindrical Sandwich Construction Design

Ultrasonic Methods for Near-Surface Flaw Detection

Complete list of printed reports begins on page 245

The PB Reports . . .

announced in this publication have just been released, usually by agencies of the U. S. Government, for dissemination to the public. In most instances they result from Government or Government-sponsored research.

The Office of Technical Services is responsible, under Public Law 776, 81st Congress, for the collection and distribution of these technical reports in the interest of American science and industry.

The more important reports are reprinted for sale to the public by OTS. Many of the reports are so specialized that the demand for them does not warrant reproduction of printed copies; originals of these documents are deposited at the Library of Congress. There they may be inspected in the Annex Reading Room, or copies may be ordered from the Library in either photocopy or microfilm.

PB reports of special interest to smaller businesses are abstracted in OTS's monthly *Technical Reports Newsletter*, available from the Superintendent of Documents, Washington 25, D. C., at $1 a year domestic, $1.50 foreign.

Since 1945 thousands of business firms have used PB reports in their research programs. These reports now constitute one of the world's largest collections of non-confidential technical information, numbering over 250,000 items. OTS has published catalogs of related reports in more than 300 areas of industrial interest. For further information relative to any of its activities, you are invited to write OTS, U. S. Department of Commerce, Washington 25, D. C.

Except to the extent indicated by acknowledgment of authorship, OTS does not edit PB reports, nor does it accept responsibility for the information and conclusions contained in them. If copyrighted material appears, permission for its use should be requested from the copyright owners. Any national security restrictions that may have applied to these reports have been removed. Patents may cover the subject matter of any report, and the reader is advised to make patent searches before developing applications based on the reports.

How To Order

ALWAYS USE COMPLETE TITLE AND PB NUMBER of each report ordered. The letter "s" accompanying some PB numbers means "supplement," "t" means "translation," and "r" means a partial or complete revision. These letters should be included as part of the PB number. Prepayment is required.

TO ORDER FROM LC • Address your order to Library of Congress, Photoduplication Service, Publications Board Project, Washington 25, D. C. Make check or money order payable to Chief, Photoduplication Service, Library of Congress. State whether report is desired in microfilm or photocopy. Microfilm copies are in 35 millimeter film and require special reading equipment; if you do not have such a machine you may be able to use one at a library in your area.

TO ORDER FROM OTS • Address your order to Office of Technical Services, U. S. Department of Commerce, Washington 25, D. C. Make check or money order payable to OTS, Department of Commerce. Reports available from OTS may also be ordered through Department of Commerce field offices.

TO ORDER FROM OTHER SOURCES • When an agency other than OTS or LC is the source, use the full address included in the abstract of the report. Make check or money order payable to that agency.

U.S. GOVERNMENT RESEARCH REPORTS

U.S. DEPARTMENT OF COMMERCE
Frederick H. Mueller, *Secretary*

BUSINESS AND DEFENSE SERVICES ADMINISTRATION
William A. White, Sr., *Administrator*

Office of Technical Services
John C. Green, *Director*

Issued monthly. Annual subscription $9 ($2.50 additional for foreign mailing). Single copy $1. Make remittance payable to Superintendent of Documents and mail either to a Department of Commerce field office or to Superintendent of Documents, U.S. Government Printing Office, Washington 25, D.C. Address changes should be sent to Superintendent of Documents.

Contents may be reprinted freely. Mention of source will be appreciated

Use of funds for printing this publication approved by the Director of the Bureau of the Budget, July 18, 1958

CLIMAX CORONAL INTENSITIES, DECEMBER 12, 1941-MAY 21, 1944, by Donald E. Billings. Technical rept. no. 4 on Contract DA 23-072-ORD-929. 3 Sep 57, 53p. 3 refs. Rept. no. HAO-37; OOR rept. 1482.4; AD-153 815.
Order from LC mi$3.60, ph$9.30 PB 147 863

The coronal spectrograms were only partially analyzed at the time the observations were made. Subsequent studies of solar geomagnetic relationships and of long-term coronal changes made the analysis of these plates very desirable. Since the plates contained no photometric calibrations, it was necessary to devise means of extracting a calibration from the Fraunhofer lines, and using this calibration to translate photographic blackenings into intensities at each position angle around the solar limb. The table of coronal intensities thus obtained is submitted. (Author)

EXTENSIVE AIR SHOWERS AT SEA LEVEL, by Frank Sherb. Technical rept. no. 71 on Contract Nonr-1841(16) and National Science Foundation Grants G2055 and G3006. 31 Aug 59, 87p. 17 refs.
Order from LC mi$4.80, ph$13.80 PB 147 714

This thesis describes an experiment directed primarily at the determination of some properties of cosmic ray primary particles with energies greater than 10^{15}ev. In addition, some information has been obtained on high-energy nuclear cascades.

Maryland U., College Park.
PRESENT STATUS OF THE EARTH'S RADIATION BELT, by S. F. Singer. Scientific rept. no. 3 on Contracts AF 49(638)630 and AF 19(604)5575. Sep 59, 9p. 2 refs. Technical rept. no. 155; AFCRC-TN-59-766; AFOSR-TN-59-1029; AD-227 260.
Order from LC mi$1.80, ph$1.80 PB 146 274

From theoretical considerations one expects to find two belts of trapped radiation around the earth. The following table, first presented by the writer in November 1958 at the San Antonio Symposium on the Physics and Medicine of Space, (in press, John Wiley and Sons, New York), lists the principal characteristics. These predictions have now been well supported by observations in satellites and space probes.

Rome Air Development Center, Griffiss AFB, N. Y.
ON THE POSSIBILITY OF SPACE SURVEILLANCE BY UTILIZATION OF SOLAR R-F ENERGY, by Joel S. Greenberg. Apr 60, 15p. 5 refs. RADC-TN-60-55.
Order from LC mi$2.40, ph$3.30 PB 147 514

The sun is a powerful transmitter which radiates a portion of its energy in the radio-frequency portion of the spectrum. The question naturally arises as to whether sufficient energy in the r-f portion of the spectrum is available from the sun so as to utilize the sun as a free transmitter in a space surveillance environment. This report discusses the possibility of utilizing the solar radiation for space surveillance; in particular, an analysis is performed for the conditions of noncoherent and coherent radiation, and the range capabilities for these two conditions are determined. (Author)

MANUAL APPLICATION OF IMPULSES WHILE TRACTIONLESS, by Ernest Dzendolet. Rept. on Human Performance on Advanced Systems. Feb 60, 16p. 3 refs. WADD Technical rept. 60-129.
Order from OTS $0.50 PB 161 804

The percentage of naive subjects who, while tractionless in a horizontal plane and anchored by one handhold, push in or pull out a plunger in one motion against various frictional forces and travel distances, decreases directly as the force and distance required. With large-force impulses, the impulse is linear and the situation can be described by the impulse-mementum theorem: $\int_0^t F dt = mv_1 - mv_0$. The shape of the impulse is saw-toothed, and its area approximated by taking three-fourths of the area of a rectangle whose base is the duration, and height, the force of the impulse. For this experiment, the maximum duration of an effective impulse for a required force of 40 pounds is 0.5 seconds for a push-in, and 0.3 seconds for a pull-out impulse. A subject, without a handhold, can seat the plunger with a push, and, in spite of the reaction to the impulse, remain attached to the equipment without unseating it. The technique is to allow the reaction to move the subject over as long a distance as possible and, since the total impulse is constant, thus reduce the force. The reduction in force allows the equipment to remain seated since the force is now less than the frictional force needed for seating. (Author)

Aerospace Medical Lab., Wright Air Development [Div.] Wright-Patterson AFB, Ohio.
WALKING UNDER ZERO-GRAVITY CONDITIONS, by John C. Simons. Rept. on Human Engineering Design Criteria for Space Vehicles. Oct 59, 12p. 3 refs. WADC Technical note 59-327; AD-232 469.
Order from OTS $0.50 PB 161 814

Army Ordnance Human Engineering Labs., Aberdeen Proving Ground, Md.
STUDIES ON THE KINETIC DEPTH EFFECT AS A MEANS FOR PRESENTING THREE DIMENSIONAL INFORMATION. I. METHODOLOGY AND SELECTION OF FORMS FOR STUDY, by Charles Fried. Mar 60, 38p. 28 refs. Technical memo. 2-60.
Order from LC mi$3.00, ph$6.00 PB 146 160

In an introductory study on the Kinetic Depth Effect, twelve stationary shadow projections of each of nine forms were presented to ten subjects to determine which forms appeared flat or two dimensional and which appeared three dimensional. This study was done to select from the nine forms a small group, all of whose shadow projections would appear as two dimensional. The only forms that appeared two dimensional to all subjects in each of their twelve shadow projections were the wire rod and the helix. The helix on examination was revealed to undergo substantially the same changes as the wire rod. A historical account of the Kinetic Depth Effect illusion and its pertinence for three dimensional displays is presented. (Author)

Electronic Research Lab., Northeastern U., Boston, Mass.
DIGITAL SIMULATION STUDY OF GAME-THEORETIC MODELS OF AN AIR TRAFFIC CONTROL SYSTEM, by John E. Letson. Scientific rept. no. 4 on Contract AF 19(604)4573. 21 Apr 60, 78p. 33 refs. AFCRC-TN-60-384.
Order from LC mi$4.50, ph$12.30 PB 147 664

A generalized large-scale, complex system is analyzed. The relation of the man-machine unit to the overall system response is considered. A particular system is established so that the effect of various strategies in a game theoretic sense might be evaluated. A study of the human decision process if the man-machine unit is discussed and graphs indicating the behavior of this operator, given certain conditions, are shown.

Stanford Research Inst., Menlo Park, Calif.
HUMAN ENGINEERING TESTING AND MALFUNCTION DATA COLLECTION IN WEAPON SYSTEM TEST PROGRAMS, by Albert Shapero, Joel I. Cooper and others. Rept. on A Method for Performing Human Engineering Analysis of Missile Systems, Contract AF 33(616)5688. Feb 60, 52p. 2 refs. WADD Technical rept. 60-36.
Order from OTS $1.50 PB 161 832

An examination was made into the frequency of human error in nine Air Force missile systems. It was discovered that human error contributed significantly (20% to 53%) to system unreliability, and that present malfunction reporting procedures are inadequate. Systematic approaches to the conduct of human engineering performance testing and the collection of adequate human-initiated malfunction data are outlined. (Author)

A SURVEY TO DETERMINE INDOCTRINATION NEEDS FOR PERSONNEL AT ISOLATED ARCTIC SITES, by Leo R. Eibert. Jan 59, 24p. 2 refs. Technical note AAL-TN-59-2; AD-230 842.
Order from LC mi$2.70, ph$4.80 PB 146 119

Contents:
Survey procedures and findings
- Attitude toward the assignment
- Conditions associated with attitude change
- Information and rumors
- Adjustment problems
- Making the tour easier and more pleasant

Implications for indoctrination
- Indoctrination courses
- Familiarization training unit
- Motivation training unit
- Supplementary indoctrination needs

Harvard Graduate School of Education, Cambridge, Mass.
VOCATIONAL DEVELOPMENT, THE ELECTION OF A SECONDARY SCHOOL CURRICULUM, AND PUBLIC POLICY, by John C. Cass and David V. Tiedeman. Rept. no. 13 on Harvard Studies in Career Development, Technical rept. no. 9 on Contract Nonr-1866(31). Aug 59, 25p. 17 refs. AD-226 732.
Order from LC mi$2.70, ph$4.80 PB 147 715

The correlation of scholastic ability with college attendance is discussed. High school curriculum choices (College, General, Commercial, Home economics, Industrial arts, Agriculture) of 884 beginning freshmen were related to those aspects of pupils that are routinely and formally available to counselors (Otis quick-scoring mental ability test, Kuder preference record, Bennett and Fry mechanical comprehension test, Minnesota paper form board, age, sex, and family income) Results indicated that the sex variable dominates the first discriminant and clearly differentiates the 2 areas of vocational education for each sex. The second discriminant differentiates the college oriented group from the remainder, but largely in terms of age for grade, family economic circumstance, and orientation to academic areas. The third discriminant differentiates the 2 vocational education areas chosen by young men. Talent figured only lightly in curriculum choise. Results indicated that cultural changes are needed to influence sex roles, and parental orientations to school and learning. Some form of therapy or remediation may be required to change a pupil's image of school and of learning (age at grade) and to gain thoughtful consideration of the concept-application conflict which is the fundamental dichotomy of liberal and vocational education.

Harvard Graduate School of Education, Cambridge, Mass.
"YOU OUGHT TO STUDY....": METHODS AND RESULTS IN RELATION TO THE ELECTION OF A CURRICULUM IN SECONDARY SCHOOL, by Violet Kugris (Educational Research Corp.) and David V. Tiedeman. Rept. no. 11 on Harvard Studies in Career Development; Technical rept. no. 7 on Contract Nonr-1866(31). Aug 59, 46p. 27 refs. AD-226 733.
Order from LC mi$3.30, ph$7.00 PB 148 150

A way to conceptualize people which simultaneously anticipates choice and provides a means of assessing the appropriateness of the choice is sought. An individual's choice of curriculum, college major, or employment is usually considered appropriate when the prediction of success in the chosen endeavor conforms with a level acceptable to some judge. In order to force simultaneous consideration of proportionality, centroid, and dispersion, three judges were given a group of profiles representative of the pool of ability in boys and girls available to a high school in a given year. The judges apportioned the profiles to the curricula of the high school according to the curriculum most appropriate for a particular pattern of ability. The pool of profiles to be sorted provides a means for counselors to resolve differences of opinion. Sorting of a group of profiles of ability indicates how one intends to utilize talents. This method is also applicable to personnel assignments in industry and the Armed Services. If differences of opinion about personnel utilization can be resolved, multivariate distributions appropriate for a choice in a closed system of alternatives could be specified through analysis, and the relative appropriateness of a choice for a person could be reported in terms of the relative frequency with which one's characteristics are found among those for whom each choice is appropriate.

Northwestern U. [Evanston, Ill.]
INTERRELATIONSHIPS AMONG LEADERSHIP CRITERION MEASURES FOR A POPULATION OF AIR FORCE PILOT CADETS, by Donald T. Campbell. Rept. on Contract AF 18(600)170. June 57, 9p. AFPTRC-TN-57-70; AD-131 421.
Order from LC mi$1.80, ph$1.80 PB 148 278

Military Aptitude Ratings (MARs) using a 5-point scale were completed on each cadet by every classmate as well as every military training instructor and every flying training instructor. These three MARs were used to compute the cadet's final military training grade. Other data included grades on non-leadership aspects of training (flying training and academic training); records of demerits at the final training base, and nomination ballots of cadets on classmates who were extremes on leadership. Criterion data were secured on numbers ranging from 239 to 423 men.

Psychology

Aviation Medical Acceleration Lab., Naval Air Development Center, Johnsville, Pa.
SPECTRAL SENSITIVITY OF THE EYE BASED ON VISUAL ACUITY, by John Lott Brown, Lester Phares, and Dorothy E. Fletcher. Rept. no. 12 on BuMed Task MR 005.13-6002.1. 26 Apr 60, 31p. 11 refs. TED ADC AE-5210; NADC-MA-6006.
Order from LC mi$3.00, ph$6.30 PB 147 785

Threshold relative energy measurements have been made with monochromatic light at 10 millimicron intervals between 400 and 710 millimicrons for threshold criteria which represent a series of visual acuities in addition to light detection. The data can be approximated by summing cone and rod sensitivities derived from earlier independent measurements of light detection by the dark adapted eye in the fovea and the periphery. The relation between the logarithm of threshold energy and visual acuity required by the criterion of threshold has been predicted from monochromatic energy data for several broad spectral distributions of illumination and predictions are compared with empirical data. (Author)

Aviation Psychology Lab., U. of Illinois, Urbana.
MAN-MACHINE TRACKING PERFORMANCE WITH SHORT-PERIOD OSCILLATORY CONTROL SYSTEM TRANSIENTS, by Frederick A. Muckler. Rept. for 1 Nov 54-1 Nov 56 on Human Factors in the Design of Operator Trainers, Contract AF 33(616)2725. Jan 60, 20p. 14 refs. WADD Technical rept. 60-3.
Order from OTS $0.50 PB 161 791

Six skilled subjects performed a single-dimension compensatory tracking task with apparatus incorporating oscillatory transients as control-system dynamics. The period of the transients was varied as the independent variable. System performance, as measured by time-on-target, improved as the transient period was increased from 1.0 to 3.5 seconds. The results are felt to be highly dependent upon specific subject task control techniques. (Author)

California U., Los Angeles.
EFFECTS OF DIFFERENT AMOUNTS OF TRAINING ON ORIGINALITY, by Irving Maltzman, Seymore Simon and others. Technical rept. no. 3 on Contract Nonr-233(50). Aug 59, 8p. 4 refs. AD-225 544.
Order from LC mi$1.80, ph$1.80 PB 148 129

Four groups of subjects received an initial and final free association test scored for originality, followed by the Unusual Uses Test. Group C received a single presentation of the initial list. Groups X_1, X_5, and X_{10}, received one, five, and ten, repetitions of the initial list with instructions to give a different response on each occasion. A fifth group, C_x, received the free association test of originality without the prior training list. The two control groups did not differ significantly on the free association test of originality. Each of the experimental groups was significantly more original than Group C, and Groups X_5 and X_{10} were also reliably more original than Group X_1. The three experimental groups were also significantly more original than Group C on the Unusual Uses Test, but they did not differ significantly from each other. These results were tentatively taken as supporting the hypothesis that originality is a form of learned behavior following the same principles as other forms of operant behavior. (Author)

California U., Los Angeles.
ON THE TRAINING OF ORIGINALITY, by Irving Maltzman. Technical rept. no. 5 on Contract Nonr-233(50). Aug 59, 14p. 31 refs. AD-225 545.
Order from LC mi$2.40, ph$3.30 PB 148 131

The basic problem in the training of originality is to devise a means of increasing the frequency of uncommon behavior. Once it takes place it may receive reinforcement and increase the probability that other original behavior will occur. Earlier attempts to devise training methods for originality were briefly mentioned, as well as related studies of problem solving. A series of experiments by Maltzman and his associates was reviewed and a procedure which consistently facilitated originality was described. This procedure involves the repeated presentation of a list of stimulus words in a modified free association situation accompanied by instructions to give a different response to each stimulus. Under these conditions the responses become more uncommon. When presented with new stimulus materials subjects receiving such training are reliably more original than subjects receiving no training. Tentative suggestions as to the behavioral bases for the training effect were also given. (Author)

California U., Los Angeles.
THE PERSISTENCE OF ORIGINALITY TRAINING EFFECTS, by Irving Maltzman, Seymore Simon and Leonard Licht. Technical rept. no. 4 on Contract Nonr-233(50). Aug 59, 7p. 3 refs. AD-225 741.
Order from LC mi$1.80, ph$1.80 PB 148 130

Two control groups received a single presentation of a free association list followed by free association and Unusual Uses tests of originality after delays of one-hour and two days respectively. Two experimental groups received comparable delays between repeated presentations of the initial list, originality training, and the originality tests. The main effects of training and delay were significant on the free association test of originality, while the main effect of training was significant in terms of unique responses on the Unusual Uses test. These results were interpreted as lending support to the hypothesis that originality is a learned form of behavior which does not differ in principle from other forms of operant behavior. (Author)

Connecticut U. [Storrs].
THE CONDITIONING OF VERBAL ASSOCIATIVE RESPONSES ELICITED BY NON-VERBAL STIMULI, by W. A. Bousfield, P. N. Herman, and G. A. Whitmarsh. Technical rept. no. 33 on Contract Nonr-631(00). Aug 59, 15p. 6 refs. AD-227 915.
Order from LC mi$2.40, ph$3.30 PB 148 147

A study is described which was designed for testing the experimental hypothesis that after a verbal CS and a non-verbal US have been repeatedly presented according to the requirements for classical conditioning, the subsequent presentation of the verbal CS should have the consequence of facilitating the occurrence of the verbal associative responses elicited by the non-verbal US. The method employed a single word as the verbal CS, and a flash of light as the non-verbal US. In the initial training, a memory

drum was used for exposing a list of stimulus words. The verbal CS appeared 14 times with 9 of these appearances reinforced by the flash of light. The remaining words, one of which also appeared 14 times, were not reinforced. Subsequent to this training a forced choice device was used for testing the effects of the initial learning. This involved the use of five tests of the following type for each of four stimulus words including the CS. For each of these words the S was instructed to select from five words the one the stimulus word most made him think of. For each such test one of the five words was a previously determined verbal associate of the non-verbal US. The analyses of the data of two related experiments indicated support for the experimental hypothesis. (Author)

THE PARASITIC REINFORCEMENT OF VERBAL ASSOCIATIVE RESPONSES, by W. D. Kincaid, Jr., W. A. Bousfield, and G. A. Whitmarsh. Technical rept. no. 32 on Contract Nonr-631(00). Aug 59, 19p. 6 refs. AD-227 916.
Order from LC mi$2.40, ph$3.30 PB 148 146

Two experiments are described which were designed to test the hypothesis that the paired-associate learning of a meaningful response word to a nonsense syllable stimulus should have the consequence of establishing connections between the nonsense syllable and the members of a group of verbal associative responses of the learned response word. Ten nonsense syllable--meaningful word pairs were presented for paired-associate learning to 113 Ss in the first experiment and to 136 Ss in the second. The response words were selected from a set of stimulus words for which free-associated norms had been previously obtained from a population of 150 Ss. A forced-choice test was developed which involved presenting each S with the nonsense syllable stimulus followed by five words one of which was an associate of the learned word. The S was instructed to select the one word which he felt was most related to the nonsense syllable. The selection by the S of the given associate was assumed to demonstrate the prior establishment of a connection between the associate and the nonsense syllable. The results strongly supported the hypothesis. No significant functional relationship was found to exist between the choices of associates in the testing situation and their cultural frequencies of occurrence as responses to the meaningful words. THE INFLUENCE OF INSTRUCTIONS AND OF REPEATED MEASUREMENT ON PERSONALITY-INVENTORY SCORES, by John R. Hills. Rept. on Contract Nonr-2214(00). June 59, 15p. 10 refs. AD-227 346.
Order from LC mi$2.40, ph$3.30 PB 147 453

An experiment was conducted to determine if the measurement properties of an inventory were influenced by whether the examinees were instructed to answer rapidly or to answer deliberately and carefully. Also examined were the speed with which the test was taken and the Total Adjustment scores on the test. It was found that the instructions do change the meaning of the scores. Also, the second form of the test is taken much faster than the first, and the examinees' personalities appear to be more adjusted on the second administration. (Author)

CAREERS AND FAMILY ATMOSPHERES. AN EMPIRICAL TEST OF ROE'S THEORY, by Douglas Hagen. Rept. no. 10A on Harvard Studies in Career Development, Technical rept. no. 6 on Contract Nonr-1866(31). 22 July 59, 18p. 4 refs. AD-220 413.
Order from LC mi$2.40, ph$3.30 PB 147 701

An attempt was made to test the basic hypothesis of Roe's theory (J. Counseling Psychol. 4:212-217, 1957). The theory deals with the family atmosphere in which the parent and child interact. Roe predicts that (1) a child from a protecting climate will select a service occupation as an adult; (2) a demanding climate disposes a person towards a career in either business contact or general culture; (3) a child from a rejecting climate later chooses a scientific vocation; (4) a neglecting climate orients an individual toward an outdoor occupation; and (5) a person from a casual childhood atmosphere pursues a career in technology as an adult. Data from 245 participants indicated that with one possible exception, Roe's theoretical scheme in its literal translation and specific application has only limited validity. Except in the case of a casual family atmosphere, the posited relationships between specific family climates and a later career choice are not supported by the data.

Harvard Graduate School of Education, Cambridge.
CONCEPTIONS OF SELF AND PERCEPTION OF ROLE IN RELATION TO CONTINUATION IN SCHOOLS OF NURSING, by Anne K. Kibrick (Boston U.) and David V. Tiedeman. Rept. no. 12 on Harvard Studies in Career Development, Technical rept. no. 8 on Contract Nonr-1866(31). Aug 59, 20p. 9 refs. AD-226 734.
Order from LC mi$2.40, ph$3.30 PB 148 149

The perseveration of decisions directing vocational behavior was investigated. It was felt that vocational development is a matter of implementing a self concept and a job concept, and that incompatibilities of either concept give rise to dissatisfaction which in

turn cause one to leave an occupation. Using schools of nursing as a frame of reference, perseveration toward the goal of nursing was studied. All students, having passed aptitude and intelligence tests, were presumed to be capable of completing the course. The experimental postulate was that perseverance in working toward the objective of becoming a nurse is a direct function of the amount of correspondence existing between the images of student and supervisor when the student embarks upon her training. Scores from questionnaires indicated the amount of agreement between an entrant's concept of her task, her role, and herself and the standards of the superiors who would train her. The agreement scores were related to perseveration toward goal in each instance, but the relationship was not very high. Thus, incompatibility at entry with the expectations of those who set the role does not have a marked influence upon staying in a school of nursing for less than six months. However, the prediction of adjustment to a situation requires that the future reality be known at entry as well as possible. (Author)

GROUP SIZE AND SOCIAL ORGANIZATION, by Morris L. Berkowitz. Technical rept. no. 5 on Problem Solving and Social Interaction, Contract Nonr-609(16). 15 Nov 57, 74p. 143 refs.
Order from LC mi$4.50, ph$12.30 PB 138 123

This study constitutes an attempt to isolate experimentally the effects of group size upon social organization. Forty-two groups, seven each of sizes three, four, six, seven, nine and ten, were selected randomly from the student body of the Basic Submarine School of the United States Naval Submarine Base, New London, Connecticut. These ad hoc groups were trained in the "calculus task" developed by Moore and his colleagues. Following training, each group was placed in a problem-solving situation in which cooperation and agreement were necessary for problem solution. The experimental arrangement was designed in such a way that subjects could communicate only through the medium of a sound-powered phone system; they could not see each other. The data were analyzed through the use of variance techniques. Twenty variables were found to be related significantly to group size.

EFFECTS OF MOTIVATION ON CONSISTENCY OF PERFORMANCE IN GROUPS, by Bernard M. Bass. Technical rept. 16 on Behavior in Groups, Contract N7onr-356(09). Feb 58, 8p. 4 refs.
Order from LC mi$1.80, ph$1.80 PB 138 285

A total of 255 ROTC cadets varying in motivation to perform well were given a "teamwork" test in groups of 5. Correlations between their judgements before and after discussions and the changes in these correlations provided measures of the social behavior of the Ss. On 3 of the 4 measures of attempted and successful leadership during a total of 10 trails, corrected split-half reliabilities were highest when motivation was lowest and lowest when motivation was highest. Reliability was never highest for any of the 11 related objective measurements when motivation was highest. It was highest at medium motivation for 5 of the measures and at low motivation for 6 of the measures of leadership, accuracy, stability and agreement with others. The results may be accounted for by the effects of stress on the variability of behavior.

Princeton U., N. J.
A METHOD OF STUDYING INTERACTION UNDER CONDITIONS OF INTERPERSONAL CONFLICT, by W. Peter Janicki and H. M. Schroeder. Technical rept. no. 6 on Contract Nonr-1858(12). Aug 59, 39p. 7 refs. AD-225 784.
Order from LC mi$3.00, ph$6.30 PB 147 694

A technique is described which provides a measure of behavior in interaction situations where an individual's response to an incongruent situation can be studied as a stimulus to another person. Data suggest the following effects: (1) college student dyads are more information oriented (i.e. pair's judgments are more independent of each other) and less normative or source oriented than high school student dyads; (2) for high school dyads friendship enhances an informational orientation, whereas for the college students friendship appears to make little difference in the relative stimulus vs. source weighting; (3) monetary reward for accuracy (information orientation) did not increase the information orientation in reward as opposed to non-reward dyads; and (4) medium IQ dyads are more source oriented, high IQ dyads more information oriented, and low IQ dyads fall in between these two groups.

AN EXPERIMENT ON ACTIVE AND PASSIVE RESISTANCE TO SOCIAL ORDER, Dorwin Cartwright, John R. P. French, Jr. and Edward Sampson. Technical rept. on Contract Nonr-1224(11). 12 Aug 59, 38p. AD-225 836.
Order from LC mi$3.00, ph$6.30 PB 148 148

The concept of resistance, especially as it results in what is called negative conformity, was analyzed by offering a scheme which seeks to elaborate upon the conditions under which such resistance will operate. Three main conditions were examined: (1) a situation of negative identification or negative attraction between the agent (O) and the person (P) in which P actively seeks to be maximally dissimilar from O; (2) a situation in which P perceives O as a false expert; and (3) a situation in which P perceives that O's influence attempt was an unsuccessful attempt to control his behavior and sets up an opposition between conformity and autonomy. From these theoretical concepts a series of hypotheses were derived and tested.

Vanderbilt U., Nashville, Tenn.
STUDIES IN ABSTRACTION LEARNING. I. A COMPARISON OF PERCEPTUAL VERSUS ABSTRACTION LEARNING, by Stanford C. Ericksen. Technical rept. no. 3 on Contract Nonr-2149(01). Aug 59, 19p. 7 refs. AD-220 929.
Order from LC mi$2.40, ph$3.30 PB 147 705

An attempt was made to provide a more explicit integration between thinking (abstraction) and perception as subcategories within the generic area of human learning. Two groups, each of which contained 14 human subjects, were compared in a 3-point, temporal walking maze. One group was blindfolded while the other group had no visual interference. The seeing subjects were labeled perceptual learners since they were free to use all available and relevant maze and room cues in learning to walk the correct temporal pattern via the 3 treadles. The blindfolded subjects were labeled abstraction learners since the external sensory cues were either not available or were irrelevent for controlling the required sequence of movements. The data indicated that seeing and blindfolded subjects can learn a 12-choice temporal walking maze with about equal efficiency. After a shift to a new starting point (rotating the maze) the blindfolded learners showed superior ability in adapting to the new demands of the 3 transfer tasks.

Vanderbilt U., Nashville, Tenn.
STUDIES IN ABSTRACTION LEARNING. II. THE RELATIVE DIFFICULTY OF "PLACE" AND "RESPONSE" LEARNING IN A HUMAN TEMPORAL MAZE, by Stanford C. Ericksen and Charles R. Porter (Master's thesis, Western Reserve U.). Technical rept. no. 4 on Contract Nonr-2149(01). Aug 59, 12p. 2 refs. AD-220 928.
Order from LC mi$2.40, ph$3.30 PB 147 706

A methodological study dominated by operationally defined conditions of perceptual (Place) learning and abstraction (Response) learning is described. The experimental objective was to compare the learning difficulty of a temporal series of Place versus Response decisions. Both tasks involved some degree of abstracting, at least counting, but the Place learners were required to utilize objective, environment cues while the Response learners ignored these external cues and controlled their learning by a self-generated set of directional cues, i.e. to go right or to go left. There were no significant differences in performance scores between the two groups being tested in these walking maze tasks. Within the limits of such a learning situation, it appears that the dependent variable responses that help define abstraction learning are no more difficult to acquire than are those responses, verbal or otherwise, which serve to define perception learning. The larger systematic importance of this series of studies on the abstraction process is believed to rest with the greater specificity given to the mediational processes which are hypothesized to account for the consistency of learning and problem solving in an ever changing environment, i.e. thinking. (Author) (See also PB 147 705)

Vanderbilt U., Nashville, Tenn.
STUDIES IN ABSTRACTION LEARNING. III. THE TRANSFER OF PERCEPTUAL VERSUS ABSTRACTION LEARNING, by Stanford C. Eriksen. Technical rept. no. 5 on Contract Nonr-2149(01). Aug 59, 53p. 9 refs. AD-220 930.
Order from LC mi$3.60, ph$9.30 PB 147 707

A laboratory procedure was developed to observe and measure perception and abstraction learning in a controlled setting. A 3-point walking maze (a 7 ft equilateral triangle) served as the spatial-temporal task in the original learning phase. All subjects learned the same sequence of 12 choices; that is, standing on one treadle, to which of the other two should he walk. Essentially, 2 transfer tasks were used: a 9-in push button finger maze triangle, and rotating the walking maze in the room. The rotation was accomplished by asking the subject to start his trial from a new and different treadle position in the room. The results show no essential difference in efficiency of original learning between the perception learning group (fixed start, normal vision) and the abstraction learners (blindfolded and/or variable start). The transfer testing clearly established the superior transferability and generality of abstraction learning. (See also PB 147 706)

Washington U., Seattle.
DIFFERENTIAL PREDICTION WITH INCOMPLETE CRITERION DATA, by Richard M. Johnson. Rept. on Contract Nonr-477(08) and Public Health Research Grant M-743(C3). Aug 59, 95p. 14 refs. AD-225 831.
Order from LC mi$5.40, ph$15.30 PB 147 695

The prediction of multiple criteria are considered when there are incomplete criterion data. The appropriate criterion is shown to be the conditional event, success given that individual i participates in criterion activity j. Also shown is that the multiple regression model which yields appropriate predictive information is the method of subgroups, which employs data from only the subgroup of individuals who participate in criterion activity j for the determination of regression weights for the prediction of activity j. Two variants of the method of total groups are discussed. The total group methods employ total group predictor data in the calculation of each vector of regression coefficients, thus removing the necessity of obtaining predictor intercorrelation matrices for all criterion subgroups. While the total group methods involve a substantial saving in computational labor, the extent to which their predictions approach the predictions of the method of subgroups is largely unknown. The method of subgroups and 2 total group methods are compared in a large-scale prediction study. Results show that: (1) the total group methods suffer slight disadvantages over the method of subgroups, which become marked only as the sizes of the subgroups increase; and (2) the total group methods are satisfactory for subgroups of size less than a few hundred. (Author)

A SECOND EXPLORATION OF THE INTERRELATIONS AMONG SOME NON-INTELLECTUAL PREDICTORS OF ACHIEVEMENT IN PROBLEM SOLVING, by Paul C. Berry. Technical rept. no. 5, on Contract Nonr-609(20). May 59, 45p. 18 refs. AD-218 599.
Order from LC mi$3.30, ph$7.80 PB 146 298

The present study is an extension and partial replication of the study described in Technical Report 4 (Berry, 1958). In that earlier study six hypotheses were tested. The results confirmed the first and sixth hypotheses, which involved differences between men and women in achievement in problem solving, but gave only partial confirmation to the second and third, and failed to confirm the fourth and fifth. The present study was undertaken to provide another test of all but the first and sixth hypotheses.

PHAGE-IMPREGNATED PAPER DISCS WITH A METABOLIC INDICATOR FOR THE RAPID TYPING OF RESISTANT STRAINS OF STAPHYLOCOCCUS AUREUS, by Elmo S. Dooley and E. H. Pine. Rept. on Environmental Physiology. 22 Apr 59, 10p. 7 refs. Rept. no. 388; AD-215 750.
Order from LC mi$1.80, ph$1.80 PB 146 267

Bacteriophage-impregnated paper discs containing tetrazolium chloride were used to type 40 strains of coagulase-positive Staphylococci aureus. The results obtained through the use of these phage discs were essentially the same as obtained by the conventional microdrop technique. The phage disc method has advantages over the conventionally used microdrop procedure in that large numbers of standardized discs can be prepared in advance, they may be used from storage as needed, and they reduce the work required to obtain satisfactory results. The use of phage discs places staphylococci typing within the capability of most hospital laboratories and makes the results of typing readily available to the epidemiologist. (Author)

FLUCTUATIONS AND GENE-ENVIRONMENT INTERACTION OF PUPATION SITE IN DROSOPHILA MELANOGASTER, by Gunther Schlager. Master's thesis. Technical rept. on Gene-Environment Interaction in DDT-Resistance and Related Characters, Contract Nonr-583(08). 31 May 59, 76p. 21 refs; AD-218 329.
Order from LC mi$4.50, ph$12.30 PB 146 297

Fluctuations in the character pupation site of Drosophila melanogastor occur when flies are reared on several batches of corn meal-syrup-molasses-agar medium. A significant added variance component among batches was found under constant external environmental conditions and in the absence of microflora in the vials. These fluctuations are apparently due to the varying chemical changes of two components of the medium: Karo syrup and molasses. When these two components are replaced by pure sugar and salts, the fluctuations are greatly reduced or eliminated. The dry sugar medium was then used in an investigation of the reaction of two selected lines to the same environmental stimulus. These lines responded differently to variations in the amount of water in the medium. This component of the environment is linearly related to the amount of peripherality in both the peripheral line and the unselected parental strain. The central line responded in a manner indicating a resistance to increased peripherality under these conditions. (Author)

SEASONAL ACCLIMATIZATION TO COLD IN MAN, by Thomas R. A. Davis, D. R. Johnston, and F. C. Bell. Rept. on Environmental Physiology. 25 May 59, 9p. 7 refs. Rept. no. 386; AD-216 006.
Order from LC mi$1.80, ph$1.80 PB 146 268

The decrease in shivering and heat production effected in man by seasonal change indicates that physiological acclimatization to climate takes place in man. Since similar physiological changes in animals are associated with an increase in resistance to cold, it is possible that man's resistance to cold can also be increased in like manner. Moreover the acclimatized man operates in the cold with greater economy as compared to the unacclimatized individual. It is proposed that this economy is achieved in large measure by a decrease in heat loss via the respiratory system. The seasonally acclimatized man shows evidence of the presence of non-shivering thermogenesis. The failure of heat acclimatization to change the criteria of cold acclimatization indicates that the two mechanisms are not mutually exclusive and de-acclimatization is due not to the presence of the other but to the absence of the adequate acclimatizing stimulus. (Author)

SOME CHARACTERISTICS OF SHIVERING IN MAN, by T. R. A. Davis, D. R. Johnston, and F. C. Bell. Rept. on Environmental Physiology. 21 May 59, 17p. 13 refs. Rept. no. 383; AD-216 005.
Order from LC mi$2.40, ph$3.30 PB 146 269

The variability of the onset of shivering between individuals cannot be correlated with surface area, race of surface or core cooling, occupation, age, or latitude of origin. After its onset shivering is maintained in a cyclic manner which appears to bear no relationship to changes in skin temperature. The mean rise in shivering activity significantly correlates with the falling skin temperature and not at all with changes in rectal temperature. Short duration inhibition of shivering is readily obtained by physical and psychical means. (Author)

RESPIRATORY AND CIRCULATORY RESPONSES OF THE HYPOTHERMIC ANIMAL TO CARBON DIOXIDE STRESS, by F. G. Hall and John Salzano. Rept. on Physiology of Flight, Contract AF 33(616)3821. Mar 60, 16p. 10 refs. WADD Technical rept. 60-82.
Order from OTS $0.50 PB 161 798

Some respiratory and circulatory responses to carbon dioxide stress during ice-water immersion hypothermia were studied in 13 dogs. Stresses were imposed by increasing the carbon dioxide tension of the inspired gas in 8 animals and by intravenous infusion of gaseous carbon dioxide in 5 other animals. It was found that, when compensation is made for the depressed ventilation exhibited at low body temperature, animals responded to the carbon dioxide stresses in essentially the same manner in the hypothermic as in the normothermic state. However, the responses are of a lower order of magnitude. (Author)

ANALYSIS OF VISUAL SENSITIVITY TO DIFFERENCES IN VELOCITY, by R. H. Brown. Interim rept. 6 May 60, 18p. 51 refs. NRL rept. 5478.
Order from LC mi$2.40, ph$3.30 PB 145 720

This report analyzes the data of an extensive experimental literature. Visual sensitivity to differences in velocity has been commonly measured by presenting two objects which move at slightly different but constant speeds. The least detectable difference in speed is the differential threshold for the magnitude of velocity. The threshold $\Delta\omega$ varies in direct proportion to the speed ω over a range from 0.1 to 20 degrees of visual angle per second for nonsuperimposed objects. When the objects are presented so that they are viewed separately, $\Delta\omega/\omega$ is the constant 0.0768. When a single moving object instantaneously changed speed, $\Delta\omega/\omega$ is the constant 0.138. Special considerations are involved in the extremely low ratio found when one moving object is seen in front of another. The report concludes with an application of the constancy in velocity discrimination to tracking and other predictive behavior. (Author)

IDIOPATHIC ORTHOSTATIC HYPOTENSION AND ITS RELATIONSHIP TO POSITIVE G TOLERANCE, by J. J. Zarriello. 21 May 59, 12p. 12 refs. Proj. NM 11 01 11 Subtask 1, Rept. no. 13.
Order from LC mi$2.40, ph$3.30 PB 147 635

This report concerns the problem of orthostatic hypotension occurring in supposedly normal, young males not having the classical, clinical symptoms of orthostatic hypotension, but having demonstrated a fall in blood pressure both systolic and diastolic on assuming the upright position. Two case histories are presented in which the individuals had no past history of dizziness or syncope on assuming the upright position but were rendered unconscious while performing aerobatic maneuvers that usually produce no untoward physiological symptoms in the normal pilot. These individuals demonstrated markedly reduced greyout, blackout, and unconscious tolerance to positive G when subjected to human centrifugation as compared to 115 normals. (Author)

STUDIES OF RESPIRATORY FUNCTION FOLLOWING THORACIC AND THORACO-ABDOMINAL INJURIES I. PULMONARY COMPLIANCE, by Morton M. Ziskind R. P. Cameron, and Oscar Creech, Jr. Rept. on Contract DA 49-007-MD-796. July 57, 9p. 10 refs. AD-212 764.
Order from LC mi$1.80, ph$1.80 PB 146 121

The pulmonary compliance of human subjects studied in the supine position was obtained from simultaneous intra-thoracic (intra-esophageal) and tidal volume changes. Strain gauge transducers were activated by these changes to produce loops upon a cathode ray oscilloscope screen. The loops were easily reproducible for a given subject and were permanently recorded on 35 mm. photographic film. Preliminary observations were made on normals, patients with diffuse pulmonary disease and patients before and after thoracotomy. The compliance values obtained were in agreement with those of other workers. Diffuse interstitial infiltrative disease decreased compliance but rarely affected the general contour of the loop. Pain and voluntary changes of respiration produced gross distortion of the loops. The compliance slope was reduced in the presence of intra-thoracic masses and chest wall incisions. The reduction of compliance following thoracotomy was usually reversed in one week. Initial studies of subjects with hemopneumothorax following stab wounds showed that the compliance was initially reduced but was almost invariably restored to the normal range following the aspiration of air and blood. OBSERVATIONS ON SERUM AND GONAD CHOLESTEROL IN PIGEONS, by Roger A. Hoffman. Mar 60, 15p. 21 refs. CWLR 2374; AD-234 997.
Order from LC mi$2.40, ph$3.30 PB 147 628

Serum cholesterol of pigeons undergoes a seasonal cycle in concentration with maximal values present in April and minimal values in August. No sex differences were apparent and both sexes exhibited this yearly fluctuation in cholesterol concentration regardless of the state of activity of the reproductive organs. Consequently, a regulation of serum cholesterol by the gonads appears improbable. Cholesterol concentration is high in the small, undeveloped testis and declines rapidly when gonad development starts. This concentration is inversely proportional to the logarithm of relative testis weight. The logarithm of cholesterol content of the testis is directly related to the logarithm of testis weight. The data suggest that testicular cholesterol is involved in gonad growth and increased mass rather than in spermatogenesis or hormone production. (Author)

Mississippi U. Medical Center, Jackson.
THE EVALUATION OF METABOLIC AND TOXIC EFFECTS OF INTRAVENOUS FAT EMULSION IN PATIENTS, by Curtis P. Artz. Rept. for 1 May 58-31 Jan 59 on Contract DA 49-007-MD-930. Feb 59, 5p. 2 refs. AD-212 288.
Order from LC mi$1.80, ph$1.80 PB 146 122

Efforts have been directed toward three phases of investigation: (a) The effect of long-term administration of fat emulsion on liver function and the coagulation mechanism, (b) the use of intravenous fat emulsion as supplemental nutrition, (c) the effect of intravenous fat emulsion on survival of the red blood cell. From the various studies carried out in all three phases it appears that 10-14 units of intravenous fat emulsion are safe and effective. Should an increased amount be necessary for appropriate therapy, liver function tests and coagulograms should be done at regular intervals. Any deviation from normal values should warn of impending danger and therapy should be discontinued. When values return to normal, therapy might be reinstituted. Intravenous fat has proved very beneficial as a supplement to an inadequate oral intake.

Oak Ridge National Lab., Tenn.
STUDIES ON THE MOUSE HEMOGLOBIN LOCUS: IDENTIFICATION OF HEMOGLOBIN TYPES AND LINKAGE OF HEMOGLOBIN WITH ALBINISM, by Raymond A. Popp and W. St. Amand. Apr 60, 5p. 13 refs. AFSAM rept. 60-52.
Order from LC mi$1.80, ph$1.80 PB 147 779

The mouse hemoglobin locus is closely linked to albinism and on the opposite side of it from pink-eye. In mice heterozygous for different hemoglobin types, each hemoglobin type is present autonomously. This indicates that the inheritance of hemoglobin traits in mice may be similar to that in man. Differences among single-type hemoglobins have been reported, but whether these variations are controlled by different hemoglobin alleles or are caused by interactions of the hemoglobin locus with other loci remains to be established. The occurrence of different hemoglobin types in a small sample from a population of wild mice was also noted. (Author)

Oklahoma State U. Research Foundation, Stillwater.
ISOLATION OF CRYSTALLINE UREASE, by George Gorin, L. G. Butler and others. Technical note no. 5 on Studies on Urease, Contract AF 18(603)135. Feb 60, 19p. 17 refs. AFOSR-TN-60-238.
Order from LC mi$2.40, ph$3.30 PB 147 631

An account is presented of some experiences encountered in the course of preparing the crystalline urease. After many unsuccessful and partially successful attempts, several preparations of high activity (89-106 S. U./mg.) were obtained, and it is believed that a detailed description of the successful procedure, and a briefer discussion of related matters, should prove of value to other investigators interested in the preparation of the crystalline enzyme.

SALT WATER FUNGI, by Ernest S. Reynolds and Samuel P. Meyers. Interim rept. on Contract Nonr-1811(00). 1 Aug 59, 23p. ML 59184; AD-225 175.
Order from LC mi$2.70, ph$4.80 PB 147 718

Uni-clonal cultures of selected marine Ascomycetes and Deuteromycetes on Manila cordage in 0.1% yeast extract sea water broth demonstrated extensive development of cellulolytic activity together with significant tensile strength reduction. The reduction of tensile strength of the cordage varied considerably between species, from 74 to 183 lbs. at the breaking point, compared to the average breaking point of the uninoculated control material of 260 lbs. The notable loss of strength by cordage when used as a growth substrate for the various lignicolous salt water fungi, demonstrates in positive fashion the destructive action of these fungi on wood fibers. The close similarity of cordage and wood in proximate analysis, except for the lower lignin content of the cordage, provides an especially favorable opportunity for strength test studies in relation to pertinent physiological and morphological characteristics of the various fungi. BOTANIC ASPECTS OF POLLINOSIS IN THE AREA OF SAN ANTONIO, TEXAS, by Robert A. Davidson. Jan 60, 60p. 56 refs. Rept. 60-20.
Order from LC mi$3.60, ph$9.30 PB 147 777

The contents of this paper are divided into three interrelated parts: Part I takes up some of the features of pollen idiotoxic specificity and attempts to rationalize these in the light of certain fundamentals of plant evolution. The importance of the relationship between pollen allergy and botany is stressed. Part II is an accounting of what may be termed the "hay fever flora" of the San Antonio, Tex., area. Part III presents the data of an air-borne pollen survey which was conducted at Randolph Air Force Base. (Author)

EXPERIMENTAL OBSERVATIONS ON POSTURAL NYSTAGMUS: LESIONS OF THE NODULUS, by Cesar Fernández, René Alzate, and John R. Lindsay. Jan 60, 18p. 22 refs. AFSAM rept. 60-23.
Order from LC mi$2.40, ph$3.30 PB 147 459

This investigation supports the idea that the nodulus acts as an inhibitor of the vestibular centers. Disequilibrium and postural nystagmus in the vertical plane characterize the deficit following ablation of the nodulus. Unlike animals with lesions in the corpus cerebelli, these experimental animals exhibit no abnormalities in posture and no cerebellar ataxia. The occurrence of postural nystagmus requires the presence of signals from vestibular receptors indicating positional changes of the head, but disturbances of equilibrium do not. This indicates a dual function of the nodulus: inhibition of the vestibular centers and, in conjunction with other systems, maintenance of equilibrium.

University Coll., Dublin (Eire).
STABILITY OF ERYTHROCYTES IN ANAEMIA (SIC). Final Technical rept. no. 4 for 28 Jan 59-28 Feb 60 on Contract DA 91-591-EUC-1070. 4 May 60, 5p.
Order from LC mi$1.80, ph$1.80 PB 147 657

It has been possible to analyze the distribution and activity of several enzymes localized in the erthrocyte, which either hydrolyze or phosphorylize adenosine nucleotides. Distribution of the enzyme depends considerably on the method of preparing the haemolysis and particulate suspension from laked cells. Pursuit of the storage lesion indicated a necessary study of ATPase activity. This enzyme is magnesium activated and has special activator requirements. Closer study revealed the presence in the stroma of a very active adenylic acid kines which effects the conversion of two molecules of ADP into one of AMP and one of ATP. After a preliminary examination of the general properties of this enzyme, a more exact investigation has been concluded. In this series of investigations it has been possible to examine the series of degradations of enzyme induced type which can dismember components of the nucleotide pool.

Pharmacology and Toxicology

Army Chemical Warfare Labs., Army Chemical Center, Md.
THE EFFECTS OF CONTINUOUS EXPOSURE OF ANIMALS TO ETHANOLAMINE VAPOR, by Maurice H. Weeks, Nelson P. Musselman and others. Technical rept. for Mar-Dec 57 on Health Hazards of Military Chemicals. Mar 60, 22p. 23 refs. CWLR 2366. AD-234 688.
Order from LC mi$2.70, ph$4.80 PB 147 549

Investigations were carried out to evaluate the toxicity of monoethanolamine (MEA) when inhaled continuously for long periods. Continuous exposure of dogs, rats, and guinea pigs to 12 ppm (or higher) MEA caused behavioral effects and skin irritation. Exposure to very high concentrations (66 ppm to 102 ppm MEA) caused death and produced lung inflammation and liver and kidney damage in dogs, rats, and guinea pigs. Exposure of animals to 5 ppm produced minimal toxic effects. (Author)

TOXICITY AND PERSONAL DECONTAMINATION OF BORON HYDRIDE PROPELLANT FUELS, by Sidney Rothberg, Joseph L. Colbourn, and Robert Salvatore. Feb 60, 15p. 13 refs. CWLR-2355; AD-233 964.
Order from OTS $0.50 PB 161 772

A study was made of the toxicity of certain liquid boron hydride fuels (BHF) of the HEF-3 and HiCal class. The fuels were administered to rats, guinea pigs, rabbits, and cats by the intravenous, intraperitoneal, oral ocular, and skin routes. Materials were tested to find an effective skin decontaminant. Surgical glove material and several silicone-based ointments were tested for their ability to protect against skin penetration; neither gave adequate protection. An aqueous ammonia solution was found to be useful in reducing the toxicity of BHF, but its function appears to be that of solubilizing the fuel for easy removal rather than destruction of the toxic moiety. (Author)

Army Chemical Warfare Labs., Army Chemical Center, Md.
THE TOXICITY OF BORON OXIDE, by James L. Wilding, W. J. Smith, II, and others. Jan 60, 18p. 15 refs. CWLR-2334; AD-233 768.
Order from OTS $0.50 PB 161 771

A study has been made to determine the toxicity of aerosols of fine particles of boron oxide, chiefly by observations on rats and dogs that had inhaled the aerosol for periods up to 24 weeks. Even in very high concentrations, 470 mg/cu m, rats that were exposed showed no signs of poisoning or any pneumoconiosis. There were some significant changes in the urinary content and pH of the exposed rats. All groups of rats exposed to concentrations of 77 and 470 mg/cu m gained weight at about the same rate as their controls. No changes or toxic signs were noted in the mature female dogs exposed for 23 weeks to a concentration of 57 mg/cu m. Histological observations of rat tissues, and blood analyses of both rats and dogs, were similar to the controls throughout the test period. Topical application produced a transitory erythema on the wetted backs of rabbits, and conjunctivitis when applied to the eyes. (Author)

Army Chemical Warfare Labs., Army Chemical Center, Md.
TOXICOLOGY OF MONO- AND DI-ISOPROPENYLACETYLENE, by Leo Feinsilver, Sidney Rothberg and others. Feb 60, 18p. 3 refs. CWLR-2341.
Order from LC mi$2.40, ph$3.30 PB 147 683

Toxicity tests of two liquids, mono- and di-isopropenylacetylene (IPA and DIPA), were carried out on laboratory animals. Selected pharmacological studies with DIPA were also made. IPA and DIPA were more toxic by intravenous than by intraperitoneal administration. IPA was more toxic than DIPA by intravenous administration and about equally toxic by intraperitoneal administration. The vapor of DIPA was more toxic than IPA vapor. The cutaneous toxicity of both compounds was low and similar, as was their ocular toxicity. When administered by intravenous and intraperitoneal injection and by vapor inhalation, IPA and DIPA affected the central nervous system and caused pathologic changes in the respiratory tract. Intravenous administration of IPA and DIPA caused congestion or hemorrhage of several other internal organs. Repeated intraperitoneal injection and acute vapor inhalation of DIPA caused necrosis of the tubules of the kidney cortex of the mouse. Repeated application of IPA and DIPA to the skin of the rabbit caused necrosis of the epidermis. Application of IPA and DIPA to the eye of the rabbit caused marked damage but no corneal opacity. Intravenous injection of DIPA produced cardiac slowing, hypotension, reduction of the heart-contractile force, reduction in voltage of the encephalogram, and effects upon gut activity. (Author)

School of Aviation Medicine, Brooks, AFB, Tex.
EFFECTS OF SOMATOTROPIN ON METABOLIC RESPONSES TO COLD, HEAT, AND ALTITUDE, by Henry B. Hale and Roy B. Mefferd (Baylor U. Coll. of Medicine). Jan 60, 22p. 10 refs. Rept. 60-34.
Order from LC mi$2.70, ph$4.80 PB 147 458

The administered STH had, in many respects, corrective effects or augmented (reinforced) adaptive changes during chronic exposure or during the initial phase of recovery from chronic exposure. Sensitivity to the injected STH varied with environments, with the length of time in an environment, and with the metabolic functions themselves.

Radiobiology

Tulane U., New Orleans, La.
INVESTIGATIONS OF THE BIOLOGICAL EFFECTS OF MICROWAVE RADIATION, by Robert T. Nieset, Rene Baus, Jr. and others. Annual progress rept. for 1958 on Contract Nonr-475(03). [1959] 61p. 11 refs. AD-225 409 and 225 837.
Order from LC mi$3.90, ph$10.80 PB 147 69?

Investigations are reported of biological effects of microwaves other than those resulting from any major increase in overall body temperature. Studies of the effects of low intensity pulsed 10 cm radiation on the growth rate of mice provided negative results. Cold blooded animals were exposed to 45 mw/sq cm in a refrigerated environment to eliminate or reduce possible effects from previous gross overall heating. Under these conditions lizards survived 2 hr or more of exposure (such exposure would normally cause mice to die of hyperpyrexia in less than 10 min). Exposure with concurrent refrigeration to moderate levels or radiation appeared to provide localized heating effects. The reflection coefficient and the depth of penetration were calculated for various tissue combinations for 1, 3, and 10 cm radiation to further characterize thermal relationships coincident with the absorption of microwaves. The results of preliminary studies of dielectric saturation were negative. (See also PB 137 143)

Uppsala U. (Sweden)
RESEARCH ON "LOCALIZED RADIO-LESIONS". PART III. BLOOD VESSEL CHANGES FOLLOWING LOCAL IRRADIATION OF THE BRAIN WITH HIGH ENERGY PROTONS, by Börje Larsson. Technical rept. no. 1, Appendix 5, on Contract AF 61(514)1247. 1 Dec 59, 18p. 14 refs. AFOSR-TN-60-252; AD-233 375.
Order from LC mi$2.40, ph$3.30 PB 146 305

The cerebral cortex and thalamus in the brain of the rat were locally irradiated with a narrow beam of high-energy protons. The developing radiolesion was studied, with attention given to changes in capillary function. Three types of changes were graded: impairment of capillary circulation, increase of permeability of trypan blue through the blood-brain barrier system, and necrosis. Circulatory disturbances seem to precede the blue-staining of irradiated brain tissue. The mechanisms involved in the rapid development of lesions described here might be different from those involved in the production of late delayed radionecrosis. The results show that the detection of changes in the blood-brain barrier system with suitable dyes or radioactive compounds may be applied as a means of early diagnosis of the radiolesion. (Author)

ESTIMATION OF CHLORIDE CONCENTRATION IN HIGH PURITY WATER BY ION EXCHANGE, by W. C. Neuenschwander. 14 Aug 58, 16p. Research and Development rept. no. 3954-58.
Order from LC mi$2.40, ph$3.30 PB 146 036

A method for determining chloride concentrations in water by ion exchange techniques has been developed. The method utilizes a mixed bed ion exchange resin for collecting chloride ions from a large volume of sample. Subsequent elution with nitric acid and turbidimetric evaluation in a small volume completes the procedure. Chloride ion in water can be estimated to a value as low as 0.01 ppm in a one liter sample, or 0.003 ppm in four liters. A sample apparatus for performing the test has been developed. (Author)

MODIFICATIONS IN THE NRL COLORIMETRIC METHOD FOR THE DETERMINATION OF BIS(2-CHLOROETHYL)SULFIDE WITH DB-3, by A. Stamulis. Interim rept. 16 May 60, 13p. 6 refs. NRL rept. 5426.
Order from OTS $0.50 PB 161 066

A program was undertaken to study and improve the present NRL colorimetric method for the determination of bis(2-chloroethyl)sulfide, commonly known as mustard gas. That part of this program which has been directed toward improving sensitivity and color stability has established the fact that hexylene glycol and Methyl Cellosolve are more effective solvents than diethyl phthalate, especially when determining residual quantities of mustard in paint films. Inorganic alkalies such as aqueous solutions of sodium carbonate, potassium carbonate, and sodium hydroxide were found to be more stable than cyclohexylamine as developing agents. The effects of pH, age, water content, and heating time on the DB-3 solutions were determined and it was found that the only modification which improved the sensitivity was in the heating period of the mustard-containing DB-3 solution, and accordingly the heating period was changed from 5 to 4 minutes. (Author)

Rock Island Arsenal Lab., Ill.
RADIO-CHROMATOGRAPHIC DETERMINATION OF 12-HYDROXYSTEARIC ACID IN FATTY ACID MIXTURES, by Max T. Fisher and W. Dennis McHenry. 28 Apr 60, 45p. 9 refs. Rept. no. 60-911.
Order from LC mi$3.30, ph$7.80 PB 147 430

Vital to the worked and water stability properties of MIL-G-10924A type greases is their 12-hydroxystearic acid content. A chromatographic method was developed which separates 12-hydroxystearic acid from other fatty acids used in grease formulations. Fatty acid samples of known composition (50% 12-hydroxystearic acid) were eluted with n-hexane-chloroform and benzene-ethanol systems through two grades of silica gel. The separation efficiencies were obtained by melting point determinations and by the use of radioactive tracers. Radiometric determinations of doubly tagged samples (12-hydroxystearic acid-H^3 and stearic acid-C^{14}) were made by gas flow techniques using an appropriate absorber and a control sample. Complete separation of radioactively tagged materials was obtained by using a relatively nonporous, large surface area, partially deactivated silica gel (15% water) and eluting with benzene followed by benzene-ethanol (97:3). Apparent, but unsubstantiated, separation of 12-hydroxystearic acid from unsubstituted saturated monocarboxylic fatty acids containing 14 to 22 carbon atoms was also obtained. (Author)

Rutgers [State U.] New Brunswick.
THE CHANGES WITH TIME OF THE CHROMIUM IONS, ZINC IONS, AND PHOSPHORIC ACID IN THE WP-1 COMPOSITION, by E. R. Allen, Leo Ojakaar, and others. Final technical rept. for year ending 30 Nov 56 on Contract Nonr-404(07). 5 Dec 56, 147p 27 refs.
Order from LC mi$7.20, ph$22.80 PB 147 465

An insoluble chromium-phosphorus-resin complex (or mixture), gray green in color and insoluble in alcohol, distinctly different from the familiar bright-green chromium-phosphorus-resin complex, has been isolated. The fate of chromium in the WP-1 mix is viewed as follows: in the fresh, i.e., 1 hour, charge some chromium^{+6} has been reduced and most of the chromium^{+3} so produced enters into organic combination. The amount of chromium^{+6} reduced increases with time and the amounts of both types of complexes likewise increase, while the amount of chromium^{+3} remains small and approximately constant. An appreciable amount of phosphorus is present in the recovered pigmentary residues, presumably as phosphates of zinc and this increases slightly with time. Appreciable amounts of zinc occur in the aqueous extracts. The evidence from pH values of aqueous extracts raises doubts as to whether free phosphoric acid exists at the 1 hour stage. Zinc, chromium, and phosphorus unite with the resin in WP-1 mixtures. Changes in PVBA with time, including the resulting production of degredation products, are now viewed as of probable importance in the WP-1 deterioration. Phosphoric acid effects a change in the PVBA during film formation.

THE THERMAL STABILITY OF METAL AMMINES. I. PENTAMMINECHLOROCHROMIUM(III) CHLORIDE, by Norman D. Peschko and B. P. Block. Technical rept. no. 3 on Contract Nonr-2687(00). 1 Aug 59, 13p. 5 refs. AD-225 087.
Order from LC mi$2.40, ph$3.30 PB 148 133

Thermogravimetric analysis indicates the loss of two moles of NH_3 from $[Cr(NH_3)_5Cl]Cl_2$ at about 250° C. in air followed by a complete loss of NH_3 as the temperature is raised. At constant temperatures of 150, 200 and 300°C. in air, however, decomposition is essentially smooth with no arrests indicated for intermediate ammines. Nevertheless it is possible to isolate a homogeneous material with empirical composition $Cr(NH_3)_3Cl_3$ by careful thermal treatment of $[Cr(NH_3)_5Cl]Cl_2$ in air. This product differs from that formed by thermal treatment of $[Cr(NH_{3.5}Cl]Cl_2$ in anhydrous HCl. The latter is not a monomeric isomer of $Cr(NH_3)_3Cl_3$ as previously suggested. Decomposition temperatures obtained by thermogravimetric analysis should be interpreted with care because of the relatively rapid heating rates customarily employed. (Author)

THE PREPARATION OF FLUORINE-CONTAINING COMPOUNDS, by R. D. Dresdner, J. A. Wethington and J. A. Young. Final rept. on Contract Nonr-580 (03). 31 Aug 59, 22p. AD-227 841.
Order from LC mi$2.70, ph$4.80 PB 148 172

Oxygen compounds: The electrofluorination of $O(CH_2CH_2COCl)_2$ was attempted as a first step in the synthesis of perfluorodivinyl ether, $(CF_2=CF)_2O$. Perfluoro ethyl ether was pyrolyzed at temperatures up to 800°C; the major products were COF_2 and C_2F_6. Nitrogen compounds: When $CF_3CF=CF_2$ was reacted in a flow system with NF_3 in about equimolar quantities over NaF, the main course of the reaction(s) suggested no catalytic activity but rather the fluorination of C_3F_6. Phosphonitrilic fluorides: $(PNF_2)_3$ and $(PNF_2)_4$ were prepared by passing either CF_3SF_5 or NF_3 over P_3N_5 heated to 700°C. Bis(trifluoromethyl) carbamyl fluoride, $(CF_3)_2$ NCOF, was prepared by an electrochemical process, and $(CF_3)_2$ NCF_2COOH was prepared by a cell process. Sulfur compounds: During the pyrolysis of cyclic perfluorothioxane tetrafluoride, SF_4 was produced and the residual free radical underwent ring closure so that perfluoro tetramethylene oxide was formed almost exclusively. The synthesis of SF_5CF_2COF was undertaken by electrochemical treatment of CH_3SCH_2COCl; however, the desired cleavage did not occur. Catalysts for fluorocarbon studies: Successful isotope exchanges were conducted with alkali fluorides containing F^{18} and $CF_3CF=CF_2$, C_4F_{10}, $(C_2H_5)_2O$, and CF_4.

ANALYSIS OF THE RESULTS OF PREVIOUS NMR STUDIES ON SOME ORGANIC DERIVATIVES OF SILICON, GERMANIUM, AND TIN, THE SANDWICH COMPOUNDS, AND RELATED MOLECULES (I). IMPROVEMENTS OF THE NMR SPECTROMETER AND VARIABLE TEMPERATURE CRYOSTAT (II), by Nathan Ockman. Technical rept. on Contract Nonr-1866(13). Aug 59, 59p. 42 refs. AD-229 397.
Order from LC mi$3.60, ph$9.30 PB 147 703

Part I: A discussion is presented of the characterization of the molecular motions in solids by nuclear magnetic resonance (NMR), including the analysis of line shape and spin lattice relaxation time and the determination of barrier heights. The data obtained from the NMR studies of 48 compounds are reviewed. Part II: The RF oscillator in the NMR spectrometer was replaced by the latest modification of the Pound-Watkins oscillator. A 60-cycle rejection filter was inserted between the output of the oscillator and the input to the lock-in amplifier (LIA). Mulay's LIA was replaced by a modified Watkins LIA in which a twin-T filter with a narrower band width had been substituted. With this apparatus, proton resonance signals with signal to noise ratios of 50 or more were obtained in ferrocene at room temperature. A cryostat, based on a design by Mulay (AD-135 507), was built. A cylindrical glass tube was substituted for the liquid-He Dewar and a thin Cu tube, on which the heater was wound, was inserted about the RF coil tube and grounded to the RF ground of the oscillator. Using this apparatus, 20 watts of heater power raised the temperature of an H_2O sample from -165° to 50°C, with a thermal gradient at -50°C of 8°C/inch. A steady state condition at any temperature in this range was reached in about 15 min.

Johns Hopkins U., Baltimore, Md.
IODINE NUCLEAR QUADRUPOLE RESONANCE SPECTRA OF SOME BORON-IODINE COMPOUNDS, by William G. Laurita and Walter S. Koski. Technical note no. 13 on Boron Hydride Chemistry, Contract AF 18(600)1526. [1960] 14p. 9 refs. AFOSR-TN-60-471.
Order from LC mi$2.40, ph$3.30 PB 147 763

The 1/2 → 3/2 iodine nuclear quadrupole transitions in iododecaborane (4) and iodopentaborane (1) have been observed at 190.8 and 196.2 Mc./sec., respectively. The splittings of the iodine resonances in BI_3 were measured for the 1/2 → 3/2 and 3/2 → 5/2 transitions. These splittings were 24 ± 2 and 43 ± 3 Mc./sec., respectively. The corresponding splittings in the iodoboranes are believed to be smaller than the resolution of the equipment and consequently have not been detected. The quadrupole coupling constants are interpreted in terms of the electronic structure of the boron-iodine bonds. The splittings of the resonances in BI_3 were found to be in reasonable agreement with theoretical expectations. (Author)

The preparation and some reactions of vinyllithium (Pub. in Chemistry and Industry, 402, 1959). The oxymercuration of trimethylvinylsilane (Pub. in Zeitschrift für Naturforschung 14b:137, 1959). Group IV (Iso) cyanides I. Trimethyl (iso) cyanogermane and trimethyltin (iso) cyanide (Submitted for pub. in the Journal of the American Chemical Society). Trimethyl (iso)cyanogermane was prepared by the reaction of isopropyl germanium iodide with AgCN in the presence of C_6H_6. Trimethyltin (iso)cyanide was prepared by the reaction of AgCN with trimethyltin bromide in the presence of C_6H_6, in 62% yield, and by the reaction of aqueous KCN with trimethyltin iodide in ether, in 20% yield. Group IV (Iso)cyanides II. (Iso)cyanides of silicon, germanium and tin as ligands in iron carbonyls (Submitted for publication in the Journal of The American Chemical Society). Trimethyl(iso)cyanisolane and trimethyl(iso)cyanogermane reacted with iron pentacarbonyl to form yellow, crystalline, sublimable and extremely air-sensitive $(CH_3)_3SiN{=}C\text{-}Fe(CO)_4$ and $(CH_3)_3GeN{=}C\text{-}Fe(CO)_4$ in good yield. Trimethyltin (iso)cyanide reacted with iron pentacarbonyl, but the analogous $(CH_3)_3SnN{=}C\text{-}Fe(CO)_4$ was formed only in very low yield, while anionic iron carbonyl species were formed in a side reaction.

Mellon Inst., Pittsburgh, Pa.
STEREOREGULARITY IN THE FREE RADICAL POLYMERIZATION OF VINYL ACETATE (PART I). MODELS OF STEREOREGULAR POLYMERS (PART II). THERMALLY STABLE POLYMERS CONTAINING THE TRIAZINE RING (PART III). ON THE ANOINIC POLYMERIZATION OF STYRENE BIPHENYL-SODIUM, A NEW INITIATOR (PART IV). ANIONIC POLYMERIZATION (PART V), by T. G. Fox, R. Donald Spencer and others. Technical rept. no. 2, 28 Feb-31 Aug 59, on Contract Nonr-2693(00). [1959] 73p. 34 refs. AD-230 119.
Order from LC mi$4.50, ph$12.30 PB 147 725

Part I: Preliminary evidence indicated that the observed differences in IR absorption and/or in solubility of polyvinyl acetate prepared under different conditions may be due to differences between various samples in OH content or in the concentration of impurities. Part II: Vinyl acetate was polymerized in the presence of chain transfer agents: trimethyl orthoformate (I), $CHCl_3$, and AcH. A chain transfer constant of 0.00076 was obtained for I and an approximate value of 0.01 for $CHCl_3$. Part III: A 50% yield of triphenyl triazine was obtained by the pyrolysis benzamidine. The bracketing of the reaction conditions favoring triazine ring-closure was somewhat successful. Conditions which favor the formation of benzonitrile and NH_3 were also learned. Part IV: A one-stage low-temperature polymerization of styrene with Na-naphthalene did not lead to an extremely sharp molecular weight distribution. Part V: Two-stage polymerization of styrene in tetrohydrofuran with Na-naphthalene, the polymerization of styrene with butyllithium, and alkali metal-initiation polymerization of α-methylstyrene are discussed. (See also PB 144 900)

Naval Ordnance Test Station, China Lake, Calif.
MICRO DETERMINATION OF NITROGEN IN ORGANIC COMPOUNDS, by E. M. Bens. 29 Apr 58, 30p. 41 refs. NOTS-1988; NAVORD rept. 5865; AD-162 637.
Order from LC mi$2.70, ph$4.80 PB 148 030

A micro method, which is of particular interest to propellant chemists, has been developed for the determination of nitrogen in organic compounds. The method is a modification of the Dumas method that utilizes a nickel oxide-nickle combustion tube filling heated to 1000°C, a supply of pure oxygen for the combustion of difficult samples, hopcalite for the oxidation of carbon monoxide, and a weight nitrometer. The oxygen supply, the combustion tube filling, and means for the removal of excess oxgyen have been changed from previous methods. (Author)

SYNTHESIS AND REDUCTION OF METHYL-VINYLNITROSAMINE AND RELATED COMPOUNDS, by N. Neil Ogimachi and Howard W. Kruse. 1 Sep 59, 20p. 7 refs. NOTS TP-2303; NAVORD rept. 6578; AD-225 489.
Order from LC mi$2.40, ph$3.30 PB 148 031

The synthesis and reduction of methylvinylnitrosamine are described. Starting with β-methylaminoethanol, it was possible to prepare methylvinylnitrosamine through a sequence of reactions involving nitrosation, chlorination, and dehydrohalogenation. The reduction of methyl-1-vinylhydrazine. Depending upon the reducing agent, the reduced products obtained were methylethylnitrosamine, methylamine, methylhydrazine, and 1-methyl-1-ethylhydrazine. Attempts to prepare 1-methyl-1-vinylhydrazine from β-methylaminoethanol through alternative routes are also described. (Author)

WETTING PROPERTIES OF TETRAFLUOROETHYLENE AND HEXAFLUOROPROPYLENE COPOLYMERS, by Marianne K. Bernett and W. A. Zisman. Interim rept. 24 May 60, 7p. 13 refs.
NRL rept. 5471.
Order from LC mi$1.80, ph$1.80 PB 145 397

It has been shown that the determining factors in the wetting of low-energy solid surfaces are the nature of the atoms in the surface and their physical packing. Of all solid organic polymers polytetrafluoroethylene is known to have the lowest surface energy and thus the lowest critical surface tension of wetting (γ_C). In this study the wettability of a series of copolymers of tetrafluoroethylene with hexafluoropropylene by a variety of organic and inorganic liquids was examined. The results show that these solid plastics have critical surface tensions which are even lower than that of solid polytetrafluoroethylene. As anticipated, the progressive increase in the proportion of perfluoromethyl side chains in the polymer introduces a higher concentration of exposed $-CF_3$ groups in the surface, which in turn progressively reduces γ_C. By extrapolation γ_C of a polyhexafluoropropylene has been calculated to give the value 15 dynes/cm. (Author)

INORGANIC POLYMERS PROGRAM, by A. J. Laffler, E. G. Teach and others. Semi-annual technical rept. for 1 July 57-1 Jan 58 on Contract Nonr-2259(00). [1958] 18p. 17 refs.
Order from LC mi$2.40, ph$3.30 PB 138 264

Work is continuing on the efficient preparation of fluorocarbon diiodides and dinitriles for monomers. No satisfactory dehydration of perfluoroglutaramide to the nitrile has been found but work is continuing on this and also on the preparation perfluoroadiponitrile. The new compound tris(trimethylsilyl) phosphine has been prepared and its reaction with diborane has been studied. (See also PB 135 554)

Yale U., New Haven, Conn.
SYNTHESIS AND STUDY OF NON-BENZENOID AROMATIC HYDROCARBONS, by William von Eggers Doering. Final narrative summary rept. for 10 May 52-30 Apr 58 on Contract DA 19-059-ORD-1562. [1958] 8p. OOR rept. no. 542. 3C; AD-137 086,
Order from LC mi$1.80, ph$1.80 PB 147 858

The synthesis of other members of the non-benzenoid aromatic hydrocarbons besides fulvene and azulene was attempted. A successful synthesis of fulvalene involved a reaction of sodium cyclopentadienide with iodine at low temperatures to give an unstable dihydrofulvalene (I). Compound I was converted to the dilithium salt. Pentance solutions of pure fulvalene were obtained by passing O into a suspension of the dianion. Heptafulvalene was synthesized by a simple sequence of reactions starting with tropylium bromide. Heptafulvene was prepared by a long tedious route involving a final Hofmann elimination. Neither sesquifulvalene nor heptalene could be prepared.

A METHOD FOR MEASUREMENT OF THE HEAT OF FORMATION OF SILICON CARBIDE, by J. W. Droege and J. F. Foster. Final rept. for 15 May 59-30 Apr 60 on Contract AF 19(604)5720. 30 Apr 60, 21p. AFCRC-TR-60-139.
Order from LC mi$2.70, ph$4.80 PB 148 094

Sodium peroxide calorimetry has been investigated as a method for the determination of the heat of formation of SiC. Zirconium was found to be a suitable container material; corrosion losses amounted to no more than a few milligrams in each experiment. Reaction with the fuels SiC, Si, and C was not complete, but the reaction product could be analyzed for unreacted sample. Benzoic acid was used as a combustion aid and oxygen at 5 atm as an oxidation promotor. The method seems well suited to the SiC determination. (Author)

A STUDY OF THE CORRELATION BETWEEN THE DEFECT SOLID STATE AND CATALYSIS, by Thomas J. Gray. Annual summary rept. for Feb 59-Feb 60 on Contract AF 49(638)288. [1960] 16p. 12 refs
AFOSR-TN-60-410.
Order from LC mi$2.40, ph$3.30 PB 147 496

The effects of radiation from a carbon arc lamp on the adsorption of oxygen on zinc oxide and zinc sulfide (in both pure and copper-activated forms) were studied. It was shown that oxygen was chemisorbed on all of the samples examined. Pure and copper-activated zinc oxide exhibited reversible photodesorption, preceded in the latter case by an initial photoadsorption. Pure zinc sulfide exhibited irreversible photoadsorption but the copper-activated sulfide was qualitatively analogous to the activated oxide. Preliminary experiments indicate that ethylene may be polymerized over irradiated zinc oxide and apparatus has been constructed to extend these observations and to examine the oxidation and hydrogenation of organic materials in the vapor phase over irradiated zinc oxide. (Author)

Colorado U., Boulder.
THEORY OF MICROWAVE ABSORPTION BY COMPRESSED OXYGEN GAS, by Masataka Mizushima. Rept. on Contract Nonr-1147(05). [1959] 19p. 11 refs. AD-219 927.
Order from LC mi$2.40, ph$3.30 PB 148 144

A theoretical explanation of the deviation between observed microwave absorption by high pressure oxygen gas and the prediction by the simple Van Vleck Weisskopf theory is attempted. Non spherical part of the intermolecular force is considered and distortion of energy levels and wave functions is calculated. It is found that the non-resonant absorption vanishes and a low frequency ($\sim$ 10 kMc) resonance appears at high pressure, while the 60 kMc resonance does not change much. This theory can explain the observed data. (Author)

ELECTRODE KINETICS OF OXIDATION-REDUCTION COUPLES, by A. P. Bond and D. Singman. 15 Apr 60, 32p. 13 refs. TR-835.
Order from LC mi$3.00, ph$6.30 PB 146 398

Electrode kinetics of several oxidation-reduction couples were investigated by means of polarization measurements at platinum, carbon, titanium, and tantalum electrodes. The Ti^{+++}-TiO^{++} and Br_2-Br^- couples were found suitable for use at the anode and cathode, respectively, of a redox fuel cell using carbon electrodes. The use of these couples with porous carbon electrodes, through which the active solutions were circulated, led to a voltage drop, caused by electrode polarization, of 0.18 v at the anode and 0.09 v at the cathode at a current density of 200 ma/cm^2. (Author)

A STUDY OF THE ALTERATION OF WATER DROPLET SUPERCOOLING BY FOREIGN VAPORS, by Joseph C. Mullins, Warren P. Hendrix and others. Scientific rept. no. 1 on Contract AF 19(604)4970. 29 Feb 60, 38p. 9 refs. AFCRC-TN-60-505.
Order from LC mi$3.00, ph$6.30 PB 147 488

An investigation was made of the freezing temperature of small water droplets in the presence of nitrogen, air, methane, argon and a mixture of nitrogen and argon. An expansion chamber was employed, and droplet temperatures at the moment of freezing were calculated being careful to correct for the latent heat of condensation. Freezing temperatures were found to vary slightly depending on the ambient gas. With nitrogen the freezing temperature was -45.5°C; methane, -44.6°C; air, -42.9°C; and an approximately equal mole per cent mixture of nitrogen and argon, -43.0°C. Argon did not give consistent results; freezing temperatures with it varied from -41.0 to -51.0°C. (Author)

CHEMICAL REACTIONS OF IONIC BEAMS, by Walter J. Moore. Final rept. on Contract DA 33-008-ORD-891. Nov 57, 3p. 6 refs. AD-155 402; OOR rept. no. 1010.3; AD-155 402.
Order from LC mi$1.80, ph$1.80 PB 147 865

Research was undertaken to develop techniques and methods for studying the reactions of gaseous ions in the form of monoenergetic ion beams. Emphasis was placed on studying the sputtering phenomena.

Institute of Mathematical Sciences, New York U., N. Y.
THREE-BODY RECOMBINATION OF OXYGEN ATOMS, by Ernest Bauer and Morris Salkoff. Rept. on Contract AF 19(604)4555. Apr 60, 34p. 74 refs. Research rept. no. CX-47; AFCRC-TN-60-404.
Order from LC mi$3.00, ph$6.30 PB 147 292

A quantum mechanical perturbed stationary state calculation has been made of the rate of recombination of oxygen atoms in the presence of an oxygen molecule as third body. The recombination is considered to take place into highly excited vibrational levels (v = 9, 10) of the $A^3\Sigma^+$ state of O_2. There are no adjustable parameters in the calculation: for the interaction potential the results (for O_2 $X^3\Sigma^-_g$) obtained in a previous calculation have been used; these results were obtained by comparison with experimental measurements of vibrational relaxation times in oxygen. At temperatures of the order 300 - 3000°K, the calculated recombination coefficient into these two vibrational levels is of the order 2 - 10 x 10^{-33} cm^6/sec, which agrees to within better than a factor of 3 with recent experimental measurements.

Johns Hopkins U., Baltimore, Md.
KINETICS OF THE DEUTERIUM EXCHANGE BETWEEN DIBORANE AND DIMETHYLAMINODIBORANE, by J. S. Rigden and W. S. Koski. Technical note no. 14 on Boron Hydride Chemistry, Contract AF 18(600)1526. [1960] 26p. 10 refs. AFOSR-TN-60-470.
Order from LC mi$2.70, ph$4.80 PB 147 764

The kinetics of the deuterium exchange between diborane and dimethylaminodiborane have been studied. The course of the reaction was followed by means of gas density measurements. The concentrations of both reactants were varied over a 20-fold range in order to establish the orders of the reaction. The reaction was found to be first order with respect to dimethylaminodiborane and half-order with respect to diborane. The activation energy was found to be 27.8 ± 3 kcal. By variation of the surface-to-volume ratio it was determined that, to within experimental error, the reaction is homogeneous. A mechanism has been proposed in which the rate-determining step is the reaction between the intermediate BH_3 and dimethylaminodiborane. The rather high activation energy is consistent with a postulated symmetrical intermediate in the rate-determining step. (Author)

Kansas U., Lawrence.
RESEARCH AND DEVELOPMENT ON THE EQUILIBRIUM CONSTANTS AND ACTIVITY COEFFICIENTS OF ION EXCHANGE RESINS, by William J. Argersinger, Jr. Final rept. for 1 Sep 51-1 Sep 54 on Contract DA 23-072-ORD-222. 30 Sep 54, 126p. 10 refs. OOR rept. no. 84.3; AD-42 310.
Order from LC mi$6.30, ph$19.80 PB 147 853

The Ag-Na, Zn-H, and Ag-H exchanges on Dowex at 25°C were extensively investigated. A theoretical treatment of the solvent H_2O activity in exchange equilibrium is presented and applied to the Na-H exchange system. The basic principles of a method of determining solution activity coefficients from cation exchange data are discussed, and an approximate treatment was used to determine activity coefficients of $AgNO_3$ and $NaNO_3$ in their mixed solutions from the ion exchange measurements. The determination of individual mean activity coefficients, and their appropriate rations, from electromotive force measurements on suitable galvanic cells containing mixed electrolyte solutions is discussed. The method was applied to the study of $ZnCl_2$-$CdCl_2$ and $ZnCl_2$-HCl mixed aqueous solutions.

Laboratori di Elettrochimica, Chimica Fisica e Metallurgia del Politecnico di Milano (Italy).
RESEARCHES ON HYDROGEN OVERVOLTAGE ON METALLIC SINGLE CRYSTALS: SILVER AND LEAD, by L. Peraldo Bicelli and B. Rivolta. Rept. on The Structure and Properties of Interfaces, Contract AF 61(052)144. Apr 60, 27p. 23 refs. WADC Technical note 59-393.
Order from OTS $0.75 PB 161 801

Hydrogen overvoltage on silver and lead single crystal cathodes oriented following the (100), (110) and (111) planes has been measured, in sulfuric acid solutions for silver, and perchloric acid and sulfamic acid for lead. Tafel law holds true, the parameters are coincident for all of the silver electrodes, while they are different for the different lead electrodes. (Author)

Metals Research Lab., Carnegie Inst. of Tech., Pittsburgh, Pa.
AN APPLICATION OF ABSOLUTE RATE THEORY TO DIFFUSION IN THE SOLID STATE, by R. W. Armstrong, J. P. Hirth, and G. M. Pound. Rept. on Contract Nonr-760(08). [1959] 9p. 9 refs. AD-220 511.
Order from LC mi$1.80, ph$1.80 PB 147 709

Fick's first law is derived from absolute rate theory for diffusion of a component in solid solution in order to determine the correct thermodynamic factor in the equation for intrinsic diffusivity. This factor is found to be $\gamma_i[1 + (d \ln \gamma_i / d \ln c_i)]$, and it is concluded that the mobility must be proportional to activity coefficient γ_i. The resulting expression for the self-diffusion coefficient D_i^R of a component in a homogeneous alloy is used to evaluate coefficients γ_i of the activated species from observed values of D_i^R and γ_i in the system Ni-Ag (Author)

Metals Research Lab., Carnegie Inst. of Tech., Pittsburgh, Pa.
EFFECT OF ELASTIC STRAIN ON THE ELECTRODE POTENTIAL OF METALS, by Ling Yang, G. T. Horne, and G. M. Pound. Technical rept. on Contract Nonr-760(08). [1959] 18p. 13 refs. AD-225 050.
Order from LC mi$2.40, ph$3.30 PB 148 141

The relationship is reviewed between stress and chemical potential to see how the unexpectedly large potential shifts and their change in sign between tension and compression may be explained in terms of thermodynamics. Only accretion constraints are applicable for reversible transport of substance to an elastically stressed pure solid, or for reversible transport of a substitutional solute to an elastically stressed solid solution. These constraints lead to an equation for increase in chemical potential at an X surface of a pure solid upon isothermal application of stress in the Y and/or Z directions and to an equation for the reversible electrode potential shift at that surface. An equation is formulated which expresses the increase in chemical potential of a substitutional solute upon isothermal application of non-hydrostatic elastic stress to a solid solution. Only absorption constraints are applicable for reversible transport of interstitial solute to an elastically stressed solid solution. The chemical potential of an interstitial solute is independent of direction of the solid surface and increases on compression but decreases on tension. Conclusion is reached that the only possible thermodynamic explanation is that the observations relate to transport of interstitial impurities between metal electrode and electrolytic solution. Hydrogen ion is suggested as a likely impurity. Only extremely high stresses, such as those which occur about line imperfections, would contribute appreciable to the corrosion rate of metals or alloys.

Naval Radiological Defense Lab., San Francisco, Calif.
STABILITY OF RADICALS PRODUCED BY IRRADIATION, by T. H. Anderson and R. S. Alger. 6 July 59, 13p. 3 refs. Research and Development Technical rept. USNRDL-TR-342; AD-220 313.
Order from LC mi$2.40, ph$3.30 PB 148 057

The concentration of free radicals in methanol at -196°C produced by electron bombardment cannot go above 1/2 M percent because the back reaction speeds up and the species crowd close enough to react with each other. These cage effects show up as the temperature goes up or down. (Author)

Oxford U. (Gt. Brit.)
RECOMBINATION OF ATOMS AT SURFACES. PART 7. HYDROGEN ATOMS AT SILICA AND OTHER SIMILAR SURFACES, by M. Green, K. R. Jennings and others. Rept. on Contract AF 61(514)1117. Feb 60, 28p. 22 refs. AFOSR-TN-59-869.
Order from LC mi$2.70, ph$4.80 PB 147 499

The recombination coefficients for hydrogen at a silica surface and a number of others such as boric oxide have been determined at temperatures between 20° and 600°C. The effect of washing and treating the silica surface in different ways has also been examined. It is possible to account for the results that have been obtained by reasonable assumptions regarding the mechanism of the recombination process, the nature of the silica surface and the changes that occur in it as a result of various treatments. (Author)

THE EFFECTS OF m- AND p-SUBSTITUENTS ON THE POLAROGRAPHIC OXIDATION OF ANILINE. EVIDENCE FOR THE SUBSTITUTED BENZENE RADICAL-ION INTERMEDIATE, by Irwin Fox, Robert W. Taft, Jr. and J. M. Schempf. Technical rept. no. 22 on Contract Nonr-656(05). June 59, 38p. 53 refs. AD-218 587
Order from LC mi$3.00, ph$6.30 PB 146 280

Attempts were made to establish whether or not the trends noted in a plot of $\Delta E1/2(E1/2^{\text{meta or para substituted aniline}} - E1/2^{\text{unsubstituted aniline}})$ vs Hammett σ values for one line defined by the points for m-CH_3, m-Cl, m-NO_2, and H, and a second line, approximately parallel to the first but displaced downward, defined by the points for the p-OCH_3, p-Cl, and p-NO_2 substituents could be placed on a quantitative basis. Efforts were also made to determine unambiguous substituent effects on the polarographic oxidation of aniline and several N, N-dimethylaniline derivatives.

Pennsylvania U., Philadelphia.
IONS IN LIQUID HELIUM, by K. R. Atkins. Technical rept. no. 3 on Contract Nonr-551(28) [1959] 34p. 20 refs. AD-220 497.
Order from LC mi$3.00, ph$6.30 PB 147 721

The mobility of an ion in liquid He^4 is known to be appreciably less than the mobility of a He^3 atom. This is explained by the suggestion that electrostriction effects increase the liquid density in the immediate vicinity of the ion so that the ion drags around with it about 50 He^4 atoms. If an almost free electron can exist in the liquid there may be an additional effect which results in a still greater effective mass. The way in which these concepts might be used to calculate the mobilities is briefly discussed. Various experimental consequences of this picture of an ion are suggested. (Author)

Princeton U., N. J.
SURFACE DIFFUSION AND RECOMBINATION HYDROGEN ATOMS ON GLASS, by Kin Tsu (Doctoral thesis) and Michel Boudart. Rept. on Contract AF 49(638)32. [1959] 37p. 26 refs. AFOSR-TN-60-195.
Order from LC mi$3.00, ph$6.30 PB 147 660

A kinetic study of the recombination of hydrogen atoms on glass has been carried out. At low temperatures, the catalytic rate appears to be limited by the adsorption process on the entire surface. At higher temperatures, it becomes controlled by the surface diffusion of adsorbed atoms to uniformly distributed active sites. At still higher temperature, reaction takes place directly and exclusively on the active sites. A theory is presented that describes the transition between the kinetic regimes and the regime of surface diffusion. The experimental data, characterized by a complicated Arrhenius behavior, are explained by this heretofore unexplored mechanism of heterogeneous catalysis. (Author)

Reaction Motors Div., Thiokol Chemical Corp., Denville, N. J.
IONIZATION IN ROCKET FLAMES, by J. Nichol, V. Siminski and H. G. Wolfhard. Rept. on Contract AF 49(638)305. [1960] 17p. 12 refs. AFOSR-TN-60-285.
Order from LC mi$2.40, ph$3.30 PB 147 545

The temperature in the combustion chamber of a rocket motor can be sufficiently high to maintain a relatively large degree of thermal ionization when small quantities of an alkali metal are added to the flame gases. This paper describes a series of measurements of ion concentrations obtained under various conditions in a rocket motor combustion chamber.

Rensselaer Polytechnic Inst., Troy, N. Y.
PRECISE MEASUREMENT OF DENSITY AND SURFACE TENSION AT TEMPERATURES UP TO 1000°C IN ONE APPARATUS, by Max R. Lorenz and George J. Janz. Technical rept. no. 3 on Contract Nonr-591(10). Aug 59, 20p. 9 refs. AD-226 420.
Order from LC mi$2.40, ph$3.30 PB 147 712

A method for the precise measurement of surface tension and density of molten salts in one apparatus at temperatures up to 1000°C is reported. The essential features of the apparatus are a density bob of special design to enable surface tension data to be gained simultaneously, and a continuously variable height crucible arrangement for the liquid sample. A description of the apparatus and the calibration procedures are given in detail. The results for molten potassium nitrate up to 470°C are reported to illustrate the method. (Author)

Stanford Research Inst., Menlo Park, Calif.
PHOTOCHEMISTRY IN THE SOLAR FURNACE, by Rudolph J. Marcus and Henry C. Wohlers. Final rept. on Contract AF 19(604)3477. 28 Dec 59, 57p. 16 refs. SRI Proj. SU-2508; AFCRC-TR-60-223.
Order from LC mi$3.60, ph$9.30 PB 147 489

The solar furnace can be used as a cool, intense light source. Equipment has been designed for use of this light source for photochemical reactions in the liquid phase. Evidence is presented on the stoichiometry and mechanism of the photoreduction of ceric perchlorate as it proceeds in the solar furnace. Light from the focal spot of the furnace also has been obtained as parallel light in order to make spectral

and energy measurements. The use of a furnace with front-silvered optics is described. Two energy storing reactions have been studied with this light source. Of these, the cerous-ceric reaction does not produce measurable quantities of hydrogen, and the photolysis of nitrosyl chloride will require a flow system in order to avoid back reactions. It is obvious that other and better energy-storing reactions need to be investigated, using this novel light source. (Author)

Technical U., Vienna (Austria)
THE ADSORPTION OF TOBACCO SMOKE: HOW FAR IS A CIGARETTE ITS OWN FILTER? by Alfred Dobrowsky. [Final rept. pt. H, 1 Dec 58-30 Sep 59, on Behavior of a Streaming Aerosol and its Interaction with Solid Obstacles] Contract DA 91-591-EUC-1011. [16 Nov 59] 7p. 2 refs. AD-230 180.
Order from LC mi$1.80, ph$1.80 PB 148 312

An experimental program was conducted to determine the ability of tobacco for absorbing tobacco smoke aerosol. A 100-g, 68-mm cigarette was smoked by forcing 40 cc of air through it in 2 sec; the process was repeated 2 times per minute. This smoke was passed through a second cigarette of identical size and finally into wadding traps. The tobacco aerosol was elutriated from the tobacco of the second cigarette and from the wadding with di-n-octyl phthalate. Repeated experiments established that an average of 61.4% of the aerosol was trapped by the tobacco in the second cigarette and 38.6% by the wadding. It was estimated that a 15 mm cellulose acetate filter adsorbs the same amount of tobacco aerosol as 17 mm of tobacco.

Technical U., Vienna (Austria)
AEROSOLS OF HCL-H_2O AND SO_3-H_2O. PART I. ISOTHERMIC PROCESS, by Alfred Dobrowsky. [Final rept. pt. B, 1 Dec 58-30 Sep 59, on Behavior of a Streaming Aerosol and its Interaction with Solid Obstacles] Contract DA 91-591-EUC-1011. [16 Nov 59] 13p. 6 refs. AD-230 178.
Order from LC mi$2.40, ph$3.30 PB 148 310

Assuming that the stability of an aerosol is given by the equality of the components partial pressures above the liquid aerosol and in the gasroom the systems H_2O and SO_3-H_2O are considered. In the HCL-H_2O system we have two partial vapor pressures. HCL and H_2O. In the SO_3-H_2O system part of the water vapor is consumed in transforming SO_3 into H_2SO_4. A further part of water vapor is consumed in diluting the said H_2SO_4 until the water partial pressure of the H_2SO_4-H_2O aerosol is equal to the partial pressure of the remaining gaseous water vapor. Formulas are given for the aerosol masses as a function of the HCL or SO_3 mass and temperature and relative humidity in an isothermic process. The aerosol masses are tabulated for 9 meteorological conditions, i.e., for 0°, 15°, 30°, each at 70, 85, 100% relative humidity and each for 6 different masses of HCL or SO_3. (Author)

AEROSOLS OF HCl-H_2O. PART II. ADIABATIC PROCESS, by Alfred Dobrowsky. [Final rept. pt. C, 1 Dec 58-30 Sep 59, on Behavior of a Streaming Aerosol and its Interaction with Solid Obstacles, Contract DA 91-591-EUC-1011]. [16 Nov 59] 11p. 5 refs. AD-230 174.
Order from LC mi$2.40, ph$3.30 PB 148 311

Into an air volume of 22400cm^3 at 0°, 15° and 30° and a relative humidity of r=70% and 100% a mass of 18, 72 and 288mg HCl gas is introduced, i.e., 1/2, 2 and 8 millimol. In every case the aerosol mass generated by an isothermic process is bigger than by an adiabatic process. The aerosol mass generated by small amounts of HCl surpasses the HCl mass many times (e.g. 18mg HCl, 0°, r=100%: isothermic 68mg fog, adiabatic 49mg). In the contrary a big amount of HCl gives a relatively small amount of fog (e.g. 288mg HCl, 0°, r=100%: isothermic 126mg fog, adiabatic 54mg). Aerosol's HCl concentration is high at low temperatures (e.g. 18mg HCl, r=100%, adiabatic: 0°, 22, 7% HCl; 30° 16, 5%) and dry air (e.g. 18mg HCl, r=70%, 0°, adiabatic: 24, 5% HCl). Rise of temperature by adiabatic process is greatest with warm and damp air (e.g. 18mg HCl, r=100%: 0° Δt=3, 8°; 30° Δt=5, 5°) and high HCl masses (e.g. 288mg HCl, r=100%, 30°: Δt=11°). When r=70% becomes Δt only circa the half of the said values. The proportion between isothermic and adiabatic fog masses is at 0° circa 1, 4: 1, at 30° circa 3:1 and heat generated by the said processes is nearly in the same proportion. Regularly the HCl concentration is bigger in an isothermic generated fog than in an adiabatic one. Only small amounts of HCl give the contrary effect. (Author) (See also PB 148 310)

AEROSOLS OF SO_3+H_2O. PART III. by Alfred Dobrowsky. [Final rept. pt. D, 1 Dec 58-30 Sep 59, on Behavior of a Steaming Aerosol and its Interaction with Solid Obstacles] Contract DA 91-591-EUC-1011. [16 Nov 59] 11p. 3 refs. AD-230 179.
Order from LC mi$2.40, ph$3.30 PB 148 309

Aerosols generated by different amounts of sulfur trioxide gas and air of different temperatures and humidities are considered. The aerosol mass, acid concentration, specific density and normality are calculated. The rising of temperature by adiabatic process is computed, as heat is produced by condensation of SO_3 and H_2O gas, compounding H_2SO_4 and dissolving it with further water approaching from gaseous status. (Author) (See also PB 148 310, PB 148 311)

THE DISTRIBUTION OF PARTICLE SIZES IN AEROSOLS, by Alfred Dobrowsky. [Final rept. pt. A, 1 Dec 58-30 Sep 59, on Behavior of a Streaming Aerosol and its Interaction with Solid Obsticles] Contract DA 91-591-EUC-1011. [16 Nov 59] 20p. AD-230 176.
Order from LC mi$2.40, ph$3.30 PB 146 055

Boltzmann's equation gives the energy distribution among a multitude of particles, and the expression

$W(\varepsilon) = B.\varepsilon^{-h.A(\varepsilon)} . d\varepsilon$ gives the probability $W(\varepsilon)$ of finding a particle at an energy level $A(\varepsilon)$. Upon dispersal of a mass the surface area will increase. To increase the surface, energy has to be extended

against the surface tension. Therefore a mass divided into very small particles will assume a higher energy level. By taking for a certain particle size a certain energy level we are able to find the size distribution law of an aerosol. The time of fall depends upon particle size according to Stokes' law. So for a certain size distribution we can compute the sedimentation rate, and vice versa, we also can prove the theory's results by experimental means. (Author)

EFFICIENCY OF SOME MATERIALS FOR AEROSOL FILTERING, by Alfred Dobrowsky. [Final rept. pt. G, 1 Dec 58-30 Sep 59, on Behavior of a Streaming Aerosol and its Interaction with Solid Obstacles] Contract DA 91-591-EUC-1011. [16 Nov 59] 6p. 2 refs. AD-230 203.
Order from LC mi$1.80, ph$1.80 PB 148 306

Experiments were made with tobacco smoke to determine the aerosol-filtering efficiencies of various materials as compared to cellulose acetate filters. Pressure drop, streaming velocity, and filter space were kept constant. Wood fibers, wadding, crepe paper, cellulose acetate fibers in irregular arrangement, and bird feathers were superior to ordinary cellulose acetate filters, while silica gels and ground glass were inferior.

SCATTERING OF LIGHT IN COLLOIDS. THE PLOTNIKOW EFFECT, by Alfred Dobrowsky. [Final rept. pt. E, 1 Dec 58-30 Sep 59, on Behavior of a Streaming Aerosol and its Interation with Solid Obstacles] Contract DA 91-591-EUC-1011. [16 Nov 59] 10p. 4 refs. AD-230 175.
Order from LC mi$1.80, ph$1.80 PB 148 308

In the Tyndall-effect the incoming light is scattered by colloid particles. Generally the intensity of the scattered light is not sufficient to cause secondary scattering effects observable by the common means used. Using infrared light and colloids of larger particle size the secondary scattering effect dissipating over the whole colloid volume is easy to detect (Plotnikow - effect) by films for infrared light. In this paper a theory about the Plotnikow effect is advanced and the calculation for the intensity field is given and the connection between the Tyndall and Plotnikow effects is discussed. (Author)

THE CORRELATION BETWEEN EARTH CURRENTS AT GODHAVN AND MAGNETIC DISTURBANCES, by Eigil Ungstrup and Arne R. Pedersen. Technical note no. 1 on Contract AF 61(514)1309. 31 July 58, 7p. 1 ref. AFCRC TN-58-641; AD-231 805.
Order from LC mi$1.80, ph$1.80 PB 146 136

An investigation is presented of correlation between earth currents, as determined by orientating measurements at Godhavn during the months of August, September, and October, 1957, and geomagnetic disturbances. A distinct correlation is shown to exist between the daily variations (average values for a month) of the earth currents and the geomagnetic disturbances, the latter being expressed by the local K-index for Godhavn. A graphical representation of 3-hourly values of earth currents, local K-indices, and planetary K_p-values suggests a good correlation between all of these quantities. (Author)

RESEARCH ON RELATIONSHIPS BETWEEN NATURAL ATMOSPHERIC RADIO PHENOMENA AND GEOMAGNETIC FIELD, by Jorgen Rybner and Eigil Ungstrup. Technical (Final) rept. on Contract AF 61(514)1309. July 59, 14p. 3 refs. AFCRC TR-59-275; AD-231 803.
Order from LC mi$2.40, ph$3.30 PB 146 135

The investigation consists in recording audio-frequency radio-wave phenomena at Godhavn, Greenland, in cooperation with the U.S. National Committee of U.R.S.I. at the request of the American Committee which has erected a chain of stations along the East Coast of America. The work consists in recording for two minutes every hour the electro-magnetic atmospherics of audio-frequencies by means of a special equipment consisting of an aerial, an amplifier, and a specially built tape recorder. The equipment has been built and designed at the laboratories of the Royal Technical University of Denmark.

THE FEASIBILITY OF THE IDENTIFICATION OF HAIL AND SEVERE STORMS, by D. Atlas and R. J. Donaldson, Jr. Jan 55, declassified 6 May 60. 95p. 37 refs. Air Force Surveys in Geophysics no. 65; AFCRC-TN-55-21.
Order from LC mi$5.40, ph$15.30 PB 148 036

Some properties of hail felt to be important for its remote detection and identification have been discussed. A number of techniques for detecting and possibly identifying hail have been proposed: (1) Measurement of the difference in returned signal intensity between vertical and horizontal polarization. (2) Absolute echo intensity. (3) Echo intensity contour mapping of a suspected hail region. (4) Pulse-to-pulse echo fluctuations. (5) Detection of electrical activity in thunderstorms. (6) Geometry of the radar echo. Of the techniques listed, the polarization and echo fluctuation methods offer possibilities for uniquely identifying the presence of hail.

CALCULATOR FOR TEMPERATURE-HUMIDITY COMPUTATION, by Gwendolyn L. Killen and Leonard E. Evenson. 24 Nov 58, 29p. 4 refs. USASRDL Technical rept. 2010. AD-227 103.
Order from LC mi$2.70, ph$4.80 PB 147 995

Measurement of atmospheric humidity and temperature from aircraft using a stagnation-type measuring system with a resistance-type humidity sensor, such as humidity-temperature measuring set AN/AMQ-7 and humidity element ML-476( )/AMT, presents computational problems in reducing the readout data to true free-stream values. The theory, design criteria, and operation of a circular slide-rule type calculator designed to facilitate these computations are described. The device simply and effectively provides for a lock-in adjustment for the humidity sensor, conversion of the output function of this sensor to dewpoint temperature, and application of the necessary aerodynamic corrections to the indications from the measuring set. Pressure altitude and calibrated airspeed (or Mach number) are used in the computations. The final readout gives the true free-stream conditions of temperature and dewpoint temperature. The calculator is intended for use at aircraft speeds below Mach number 1.0. By modification of the appropriate scales, the design can be easily adapted for use with other equipments of similar design. (Author)

AIR TEMPERATURE AND PRECIPITATION ON THE GREENLAND ICE CAP, by Marvin Diamond. Oct 58, 13p. 16 refs. Research rept. 43.
Order from LC mi$2.40, ph$3.30 PB 148 469

Charts of mean annual air temperature and precipitation over the ice cap are constructed on the basis of snow-profile studies at 8 locations, data collected for several years after 1953 at two U.S. Air Force weather stations, and records from expeditions since 1930. The warming trend in the Arctic appears to have occurred to a lesser degree on the ice cap, possibly because of the effect of the snow cover. The lowest mean annual temperature in South Greenland is estimated to occur within the area bounded by the 2500 m contour and the -18C isotherm; mean annual temperature at 2700 is estimated as -20.9C. In North Greenland, the mean annual temperature at 1700 m is estimated at -22C. The presence of ice glands in the snow and daily max summer temperatures, estimated from records of coastal stations, indicate a potentially high incidence of melting at about 1300 m elevation and some melting at 1700 m in North Greenland, and melting up to 2700 m in the South. Annual accumulation is 2-3 times as great at 2500 m on the west side of the ice cap as at the crest. South of 66°N, precipitation may be about twice as great on the east side of the crest as in the west. (Author)

INVESTIGATIONS OF FOG WHITEOUT, by Howard Reiquam and Marvin Diamond. July 59, 23p. 35 refs. Research rept. 52; AD-226 992.
Order from LC mi$2.70, ph$4.80 PB 148 471

The results of studies on the physical properties of fog whiteout, as it occurred at Site 2 on the Greenland Ice Cap in the summers of 1956 and 1957, are reported. The instruments, methods of measurement, and data-reduction techniques used are described. Attempts at dissipating whiteout by AgI seeding are discussed briefly. Emphasis was given to measurements of fog-particle size distribution, liquid-water content, relative humidity, visibility, and atmospheric nuclei. The synoptic situations for 2 selected cases of fog whiteout at relative humidities of less than 100% (possibly because of the presence of salt solutions) are described. The balance between the rate at which water is made available in the air as it is lifted over the Ice Cap and the rate of water flux to the snow surface is computed. Efforts at fog dispersal by AgI seeding from the ground were inconclusive. (Author)

RESEARCH CONCERNING FORECASTING ANOMALOUS PROPAGATION AT HIGH LATITUDES. ANOMALOUS foF2 VARIATIONS IN THE ANTARCTIC, by G. E. Hill. Scientific rept. no. 5 on Contract AF 19(604)4092. Apr 60, 43p. 7 refs. Technical rept. RAD-TR-60-13; AFCRC-TN-60-362.
Order from LC mi$3.30, ph$7.80 PB 147 658

The daytime minimum in the F2-layer critical frequency, which is often observed in the Antarctic, is explained on the basis of a vertical shear in the horizontal wind (neutral air) and the resulting movement of charged particles in the presence of the earth's magnetic field. The diurnal variation of the F2-layer critical frequency, as expressed by the noon minus the midnight value, D, is normally positive, but in the case of the daytime minimum, is negative. A three-level model of the F region has been developed for the purpose of demonstrating the effect of a vertical wind shear on the electron concentration. The results of electron-density computations for several cases have shown that the characteristic F2-layer critical frequency variations can be explained on the basis of a wind shear of the order of 25 to 50 meters per second per 100 kilometers. The wind shear can account for most of the "anomalous" behavior in the Antarctic.

METEOROLOGICAL STUDIES USING CONSTANT ALTITUDE BALLOONS, by Homer T. Mantis and William F. Huch. Technical rept. no. AP-14 on Atmospheric Physics Program, Contract Nonr-710(22). Aug 59, 69p. 12 refs.
Order from LC mi$3.90, ph$10.80 PB 147 696

In the course of a project to investigate the behavior of plastic balloons, a number of balloon flights were made in the upper troposphere with very accurate positioning and precise altitude control. These balloon flights yielded what is believed to be unique information on wind structure at intermediate scale. This report consists of three separate papers; the first is a description of the balloon system used for precise trajectories the second summarizes the information on wind structure at intermediate scale and the third reviews the work on the relationship between synoptic forces and constant altitude balloon trajectories.

DEEP CORE DRILLING IN ICE, BYRD STATION, ANTARCTICA, by R. W. Patenaude, E. W. Marshall, and A. Gow. July 59, 11p. Technical rept. 60; AD-227 121.
Order from LC mi$2.40, ph$3.30 PB 148 467

The preliminary results of core examinations and drill-hole temperature studies from Nov 1957 - Jan 1958 are reported, and the drilling equipment and techniques are described. Drilling was accomplished with a Failing model 314 rotary skid-mounted well-drilling rig with a 38-ft mast, powered by a 43-bhp Buda gasoline engine. Two types of bits, both cutting a 3 7/8-in. core and a 5 3/4-in. hole, were used. The speed of rotation was varied from 40-75 rpm, and the rate of penetration ranged from 2.5-10 in./min. Compressed air was used as the drilling fluid. Good quality cores were obtained down to 1013 ft with a 98% recovery. Examination of the cores revealed the presence of a detailed stratigraphic sequence down to a depth of 400 ft, consisting of alternating layers of coarse and fine-grained snow associated with ice bands 4 mm thick, which appeared singly or in closely spaced groups at regular intervals. Below this depth the ice was very homogeneous, except for thin ice bands which persisted to the bottom. The mean densities for meter increments to a depth of 150 ft, densities determined from spot samples at 5 points from 400-721.5 ft, and drill-hole temperatures down to 1000 ft are tabulated. (Author)

Army Snow, Ice and Permafrost Research Establishment, Wilmette, Ill.
FLEXURAL STRENGTH OF CLEAR LAKE ICE, by Robert D. Hitch. Master's thesis. July 59, 12p. 5 refs. Technical rept. 65; AD-231 914.
Order from LC mi$2.40, ph$3.30 PB 148 477

Values for the modulus of elasticity and strength of fresh-water lake ice in flexure were determined by laboratory experiments on 63 beams tested under various rates of loading at -5C and -20C. The results were obtained by measuring the center deflection of the test beam and the load simultaneously. Third point loading was used in order to develop a more favorable distribution of bending stresses in the middle third of the beam than with a simple beam. The experiments indicate that properties of ice vary according to loading rate, temperature, and crystal size. Specifically the results show: (1) lower temperatures give higher values of the modulus of elasticity and strength, (2) ice with larger crystals will have a higher modulus of elasticity but little difference in strength, and (3) the rate of loading increases the modulus of elasticity but has little effect on the strength except at low temperatures where higher strength values are obtained with a faster rate of loading. (Author)

Army Snow, Ice and Permafrost Research Establishment, Wilmette, Ill.
GLACIOLOGICAL INVESTIGATIONS IN THE THULE RAMP AREA, by Valter Schytt. Rept. on Northwestern U. Contract DA 11-190-eng-12. Apr 55, 93p. 5 refs. SIPRE rept. 28.
Order from LC mi$5.40, ph$15.30 PB 148 465

During the 1954 field season, from 19 June to 29 August, accumulation and ablation measurements were made on the Ramp and farther inland to Mile 20 (from Thule Take-off). Meteorological measurements were obtained for correlation with the glaciological work. Accumulation on the Ramp averaged 55 cm of snow and varied considerably, showing high values on concave slopes and low values on convex slopes. Farther inland, the order of magnitude of winter snow depths was 100 cm from Mile 4 to Mile 7; 150 cm from Mile 8 to Mile 14; and 100 cm from Mile 15 to Mile 20. Except for a narrow belt of winter accumulation just inside the edge of the glacier, the Ramp below 700 m belonged to the area with net ablation. Studies were made on formation of superimposed ice; debris features in the moraine area; and ice movement and structure in the vicinity of Thule Take-off. Some observations on trafficability of the route are included. (Author) (Also included in PB 146 024)

Army Snow, Ice and Permafrost Research Establishment, Wilmette, Ill.
INSTRUMENTATION OF ICE CAP STATIONS, by B. Lyle Hansen. Preliminary rept. Apr 55, 7p. SIPRE rept. 23.
Order from LC mi$1.80, ph$1.80 PB 148 462

Two stations on the Greenland Ice Cap were instrumented as follows: (1) copper resistance thermometers were installed to determine the effect of the buildings on the subsurface temperatures; (2) a recording bench mark was installed and the elevations of selected points in the buidlings were determined by leveling from the bench mark; (3) reference points were established at which diameters of the tubes are measured and from which the orientation of the tubes can be determined by observations with a transit; and (4) various types of pressure cells were installed in order to determine some of the forces causing deformation of the buildings. (Author) (Also included in PB 146 024)

PENETRATION OF SHAPED CHARGES INTO FROZEN GROUND, by Robert Benert. Apr 57, 23p. 3 refs. Technical rept. 45; AD-141 808.
Order from LC mi$2.70, ph$4.80 PB 148 470

Tests were conducted in 1955-56 at Fort Churchill (Man.) with 6 standard and experimental shaped charges to determine their usefulness in producing holes to receive explosives for the excavation of foxholes. The typical hole produced in sandy silt with a 12-in. peat cover consisted of a crater surrounding a narrow deep hole. Max. penetration depths ranged from 108 in. for the 40-lb M3 charge to 22 in. for the 2.75-oz Du Pont jet tapper. The M2 (10 lb). M2A3 (15 lb), and M3 met the min. hole-dimension requirements (5 ft deep by 2 in. wide); the 20-lb and 5-lb experimental charges were inadequate. Performance of the jet tapper indicated that further experiments with charges of this design are advisable. Buried boulders, though sometimes shattered by the jets, more frequently blocked them, and incomplete tests on natural ice indicated a relatively greater penetrability than the tests on frozen ground. The theory, methods, and equipment of the tests are described in detail, and the data obtained are tabulated and graphed. (Author)

Army Snow, Ice and Permafrost Research Establishment, Wilmette, Ill.
RADIATION MEASUREMENTS ON THE GREENLAND ICE CAP, by M. Diamond and R. W. Gerdel. Oct 56, 26p. 9 refs. Research rept. 19.
Order from LC mi$2.70, ph$4.80 PB 148 468

Measurements were made of global and net radiation between 6 July and 7 August 1955 at a site on the Greenland Ice Cap located near 78°N. latitude and at an elevation of 6800 ft. Diffuse sky radiation amounted to only 19% of all incoming global radiation measured at the Ice-Cap research site. Incident global radiation was reduced by 6% in the presence of a 0.5 cloud cover. The long-wave radiation balance at this site on the Ice Cap was always negative during the period covered by this study. Errors associated with the measurement of solar radiation at the low sun angles which prevailed at the research site were found to be about -3%. During periods of blowing and drifting snow, 6% more global radiation was measured at 1.25 m above the snow surface than at 5.7 m elevation. The atmospheric transmission coefficient at the Ice Cap site was found to be 0.968. The heat balance of the snow cover as computed from the radiation measurements and a temperature profile in the snow was found to be 7.6 ly/day at the Ice-Cap site. (Also included in PB 146 023)

Army Snow, Ice and Permafrost Research Establishment, Wilmette, Ill.
ROLE OF THE ELECTRIC DOUBLE LAYER IN THE MECHANISM OF FROST HEAVING, by L. A. Cass and R. D. Miller. Rept. on Cornell U. Contract DA-11-190-eng-23. Aug 59, 27p. 21 refs. Research rept. 49.
Order from LC mi$2.70, ph$4.80 PB 148 466

It is suggested that the osmotic activity of the electrical double layer on mineral particles can account for the heaving phenomenon in soils, and equations are given relating the osmotic pressure (and freezing temperature) of water at the base of a growing ice lens to overburden pressure, depth of water table, depth to the conducting stratum, hydraulic conductivity of soil, and rate of heave. Water flows to the ice face ordinarily by hydraulic conduction, but by diffusion in the unfrozen film between the upper-most particles and the underside of the ice lens. Coarse materials show little heave because of diffusion limitations on recharge of the unfrozen film. The theory of Jackson and Chalmers that super-cooling is required for heaving is denied, and a "solution model" is proposed in which heaving can occur in the absence of soil. Various methods of modifying or controlling frost heaving are reviewed in the light of the theory, and experiments are proposed for evaluating the theory. (Author)

Army Snow, Ice and Permafrost Research Establishment, Wilmette, Ill.
SCIENTIFIC WORK OF PARTY CRYSTAL, 1954, by Carl S. Benson. Preliminary rept. Apr 55, 12p. SIPRE rept. 24.
Order from LC mi$2.40, ph$3.30 PB 148 463

Party Crystal, a small mobile scientific party, conducted snow studies during the summer of 1954 on the Greenland Ice Cap eastward from Thule, Greenland. Work included measurements of elevation, snow accumulation, summer melting, and snow properties. Final results of the season's work will be combined with the work of 1952 and 1953 and published at a later date. The average annual accumulation is approximately 60 cm of water equivalent for the first segment of the trail (58.5 mi); drops to 20 cm in the next 30 mi and remains low for approximately 45 mi; rises to nearly 40 cm for the next 85 mi; then decreases again to the east. Along the first 40 mi of the trail, the year's accumulation of snow becomes completely soaked during the melt season, making a very poor surface for vehicles. Beyond that point, the depth of soaking decreases rapidly. Ice masses due to percolation of melt water are very common and frequently large along the first 58.5 mi, decrease in size along the next 60 mi, and occur very infrequently farther east. (Author) (Also included in PB 146 022)

Army Snow, Ice and Permafrost Research Establishment, Wilmette, Ill.
STUDIES ON VEHICULAR TRAFFICABILITY OF SNOW. PART II, by John J. Lanyon. July 59, 27p. 6 refs. SIPRE rept. 35.
Order from LC mi$2.70, ph$4.80 PB 148 460

The results are reported of investigations during the winters of 1955, 1956, and 1957 at the Keweenaw Field Station (Mich.) and in summer 1956 in N. Greenland to determine the relationship between certain meteorological parameters and the traffic-supporting capacity of snow cover. The vehicles used in the studies included an M-7 Ordnance snow tractor, a 4-pontoon Tucker Sno-Cat, and an M-29C weasel. A Bombardier Muskeg Tractor was modified and instrumented for use as a testing dynamometer vehicle. Max. drawbar pull for the M-7 tractor loaded with concrete blocks was obtained at a mean ground pressure of 1 psi. Max. efficiency of the tractor was between 10 and 20% slip. The efficiency coefficient of the Sno-Cat exceeded that of the M-7 tractor by 4%. Both face-angle grousers of the Kamm type and iron angle grousers of the same profile were tested on the track pads of the M-7 tractor. An increase of 30% in drawbar pull was obtained with supplemental grousers, but the overall results did not appear to justify the use of face-angle grousers. More tractive force was developed on the rear than on the front pontoons of the Tucker Sno-Cat. Tests in Greenland indicated that drawbar pull is directly related to both the density and hardness of the top 50 cm of snow. No relationship was found between air temperature and snow trafficability, drawbar pull and snow temperature, and snow hardness and density. (Author)

Dartmouth Coll., Hanover, N. H.
THE ABSORPTIVITY OF ICE: A CRITICAL REVIEW, by J. B. Lyons and R. E. Stoiber. Scientific rept. no. 3 on Contract AF 19(604)2159. 31 Oct 59, 14p. 22 refs. AFCRC-TN-59-656; AD-230 753.
Order from LC mi$2.40, ph$3.30 PB 146 195

The literature on ice absorptivity determination is critically evaluated in the light of new measurements. Clear flawless ice has transmissivities close to those of distilled water, with the infrared absorption bands offset slightly toward higher wavelengths. Bubbly ice, the variety commonly encountered in nature, has absorptivities in the range of 100 times greater than those for flawless ice; this effect is largely due to scattering. In the visible and near infrared range polycrystalline ice has transmissivities close to those for single ice crystals. The differential absorptivity for the e and o-rays is shown to be non-existent. (Author)

Villanova U., Pa.
ICE CONTROL ON AIRFIELD RUNWAYS, by G. N. Quam. Progress rept. on Contract NBy-4303. 30 Sep 56, 27p.
Order from LC mi$2.70, ph$4.80 PB 137 412

A particularly appealing method of controlling ice on airfields is to be able to push all the ice that forms off of the runways with an ordinary snowplow, roadscraper, or street sweeper. Accordingly, a search for a suitable coating that will almost eliminate adhesion of ice to the runway in being made. The adhesion of ice to a variety of coatings and other surfaces is being measured by both tensile and shear techniques. Attempts to synthesize ionic polymers, expected to be ice-phobic, are being made.

Geodesy

Chicago Aerial Industries, Inc., Melrose Park, Ill.
PRINTER, PROJECTION, PHOTOGRAPHIC EN-29A( ), by Carvyn Ellman, Gary Lynn and others. Final rept. on Contract AF 30(602)1750. Jan 59, 28p. RADC-TR-59-22; AD-210 722.
Order from LC mi$2.70, ph$4.80 PB 146 123

The EN-29A( ) Photographic Projection Printer, hereinafter referred to as an orthophotoscope, is an instrument used to convert perspective aerial photographs into a negative which, when printed, is the equivalent of an orthographic projection in which all horizontal distances appear in the same scale. Since the scale of an aerial photograph is constant only if the terrain has a constant elevation, objects on a variable elevation terrain that are of higher elevation appear larger than equal size objects of a lower elevation. Accurate scaling of aerial photographs is impossible.

Office of Technical Services, Dept. of Commerce, Washington, D. C.
PHOTOGRAMMETRY (SUPPLEMENT TO CTR-335). May 60, 7p. 92 refs. OTS Selective Bibliography 416.
Order from OTS $0.10 OTS SB-416

A bibliography of reports listed in the two OTS monthly abstract journals: U. S. Government Research Reports and Technical Translations. Reports listed cover photogrammetry and aerial photography, as well as general research on maps and mapping.

Wharton School of Finance and Commerce, U. of Pennsylvania, Philadelphia.
A STUDY OF THE APPLICATION OF ELECTRONIC SCANNING AND COMPUTER DEVICES TO THE ANALYSIS OF GEOGRAPHIC PHENOMENA, by James P. Latham. Final rept. on Contract Nonr-551(29). 31 Aug 59, 6p. 1 ref. AD-227 256.
Order from LC mi$1.80, ph$1.80 PB 148 143

Progress is summarized in connection with the utilization of electronic scanning devices to measure and record the linear distance of the intercepts resulting when traverses sample a mapped distribution. Determinations were made which indicate the feasibility of scanning mapped, and aerially photographed, distributions in a manner which discriminates phenomena differentiated by gray tones or color. Capabilities of the flying spot scanner are summarized with reference to: (a) counting of the occurrences of a particular phenomenon within a scanned field; (b) counting occurrences by other phenomena with differentiating gray tone expressions; (c) performing above functions in one second for fields 4 1/2 x 4 1/2-in. by utilizing 1000 parallel scanning lines composed of 1000 elements each; (d) altering direction of scanning lines crossing field; and (e) reading out counts on display panels or printed tape. Modifications of the flying spot scanner is shown to increase capabilities with regard to measuring and counting the number of occurrences falling within diameter size classes, measuring and counting the intercepts by scanning lines with the occurrences of a phenomenon, and tripling the refinement of the scanning process.

Oceanography

Acoustica Associates, Inc., Plainview, N. Y.
TESTS OF ULTRASONIC INHIBITION OF MARINE GROWTH. Final rept. on Contract Nonr-2764(00). 11 Aug 59, 11p. Document DO-787; AD-226 998.
Order from LC mi$2.40, ph$3.30 PB 148 182

The effect of ultrasonic energy on the rate of marine growth was investigated. A stainless steel sonar dome was submerged in Biscayne Bay, Miami, Florida. An Acoustica, Model DR-500, 500-w ultrasonic generator and 2 Acoustica Model AT-1600 magnetostructive transducers provided the ultrasonic energy to the dome. Tests indicated that the attachment of marine growth on a stainless steel surface was not inhibited by the ultrasonic excitation in frequency region of 26 kc at any practical intensity level.

Chesapeake Bay Inst., Johns Hopkins U. [Annapolis, Md.]
BALTIMORE HARBOR CRUISES I - XVI, JULY 1958-NOVEMBER 1959. Dec 59, 222p. Data rept. 31; Ref. 59-4; AD-231 588.
Order from LC mi$9.90, ph$34.80 PB 146 275

Data were collected in the Baltimore Harbor and the adjacent area of the Chesapeake Bay during 16 survey cruises. The surveys were conducted to determine the distribution of temperature, salinity, and foreign waste acid in the area. The data furnish information on the rate of exchange of portions of Baltimore Harbor with each other and with the Chesapeake Bay. (Author)

PHYSICAL AND CHEMICAL HYDROGRAPHY OF THE MAGOTHY RIVER, by D. W. Pritchard and R. E. Bunce. Rept. on Contract Nonr-248(20). Mar 59, 104p. 2 refs. Technical rept. 17; Reference 59-2.
Order from LC mi$5.70, ph$16.80 PB 146 343

The Magothy River is a tributary estuary of the Chesapeake Bay, located on the western shore of the Bay between the Patapsco River (Baltimore Harbor) to the north and the Severn River to the south. The name "river" is in fact a misnomer. The Magothy is a drowned valley of a small drainage system, with a water surface area of 8.74 square miles (statute) and a drainage area of 31.12 square miles. The entire Magothy estuary is shown, together with the land drainage area supplying fresh water run-off to the estuary. The length of the estuary, taken along the course of the channel from the mouth at Mountain Point to the head of tide, is 7.0 miles. The maximum width, which occurs in the vicinity of Sillery Bay, is 2.2 miles, though the width at the mouth is only 0.4 miles. As a result of the constricted entrance, tidal currents maintain a short scour channel at the mouth of the Magothy with a maximum depth of 40 feet. This scour channel extends less than 0.4 miles into the estuary, and depths within the Magothy are otherwise less than 20 feet. The 12 foot submarine contour has been entered on figure 2, and the depths at selected points along the channel are also indicated. The mean depth of the estuary is approximately 10 feet. (Author)

Engineer Corps, Washington, D. C.
TIDAL FLOW IN ENTRANCES, by John L. French. Jan 60, 68p. 20 refs. Technical bulletin no. 3, AD-232 302.
Order from LC mi$3.90, ph$10.80 PB 146 211

Two analytical studies are described. In the first, the methods of potential theory applied to the problem of determining the velocities in the approaches to a canal connecting an ocean with a lagoon or bay. Entrances with and without jetties extending into the ocean are considered. The streamlines are determined and velocities along the streamlines are given in a form suitable for simple application to engineering problems. In the second study, Tollomien's analyses for (1) the free jet boundary and (2) jet efflux from a linear slot are applied to the problem of the efflux of a 2-dimensional jet from a slot of definite width with particular reference to jet flow from a channel into a region of surrounding quiet water, such as an ocean. The literature was searched for appropriate experimental data, and the constant of Tollmien's theory is evaluated accordingly. The streamlines are determined, and velocities along the streamlines computed and presented in a manner susceptible of simple application to practical engineering problems. (Author)

National Research Labs, Ottawa (Canada).
THE N. R. C. PRESSURE-TYPE TIDE RECORDER, by E. H. Bowler. Jan 60, 40p. 1 ref. Mechanical engineering rept. MI-820.
Order from LC mi$3.00, ph$6.30 PB 147 736

This report describes a tide recorder, operable either from a battery or 115-volt 60-c. p. s. line power supply, suitable for use in remote locations (including the Arctic), for periods up to ten days without attention. The water level is determined by a hydrostatic pressure measurement with a submerged resistance potentiometer type transducer, which transmits a signal, through interconnecting cable, to a shore-based servo-balanced recorder. Atmospheric pressure variations and gravity wave effects are compensated in the system. Pressure accuracies of ±1/4 foot of water are achieved at temperatures down to +15°C and to ±1/2 foot to -20°C. (Author)

Naval Ordnance Test Station, China Lake, Calif.
FAST PHOTOGRAPHIC SPECTROPHOTOMETER FOR UNDERWATER USE, by Julian L. Thompson. 15 Feb 60, 19p. 6 refs. NOTS TP-2429; NAVORD rept. 7040.
Order from OTS $0.50 PB 161 774

An underwater photographic spectrophotometer has been constructed at the U. S. Naval Ordnance Test Station and tested for the direct measurement of the spectral composition of transmitted and scattered light at various ocean depths. By utilizing a wedge interference filter as the analyzing element, relatively high photographic recording speed and simultaneous recording of intensities throughout the visible spectrum have been achieved. The photometer has been tested to depths of 200 ft and has yielded data compatible with that published by others. Tests and design refinements are continuing toward the goal of eventual use at great depths. (Author)

OCEANOGRAPHY AND METEOROLOGY OF THE GULF OF MEXICO, by Hugh J. McLellan. Annual rept. for 1 May 57-30 Apr 58, on Contract N7onr-487(02). 1 May 58, 16p. 15 refs. Reference 58-7A.
Order from LC mi$2.40, ph$3.30 PB 146 333

Physics of the Atmosphere

Aeronutronic, Newport Beach, Calif.
ELECTRON CAPTURE IN THE IONOSPHERE BY DUST PARTICLES, by Raymond J. Munick and Robert T. Folk. Rept. on Contract AF 19(604)5486. 10 Mar 60 36p. 18 refs. Pub. no. U-823; AFCRC-TN-60-186
Order from LC mi$3.00, ph$6.30 PB 147 548

The dust particles rather rapidly acquire an equilibriun charge, which depends upon the balance between photoemission in the sunlight and the collection of positive ions and electrons. Available photoelectric current densities vary over so wide a range that charge of either sign can be acquired. This charging process provides a transitory increase or decrease of electron density. Positively charged particles have little effect on the electron density, but negatively charged particles continue to collect electrons in appreciable numbers. The general conclusion is that dust in amounts which can be raised by rocket can have significant effects upon the electron density of the ionosphere. (Author)

Allied Research Associates, Inc. [Boston, Mass.]
AN EVALUATION OF OZONESONDES, by Arnold H. Glaser, Frederic E. Hatch, and William Stevens, Jr. Final rept. on Contract AF 19(604)3493. 29 Feb 60, 96p. 97 refs. AFCRC-TR-60-243.
Order from LC mi$5.40, ph$15.30 PB 147 557

Available sounding instruments capable of measuring atmospheric ozone are evaluated to ascertain their suitability for use on a semiroutine basis over an extended network. The Paetzold Ozonesonde is an optical instrument which determines the amount of ozone between the sonde and the sun by differential absorption of two ultraviolet wave lengths. The Mast Ozonesonde is an American adaptation of the successful Brewer chemical sonde. The Regener Ozonesonde carries the standard potassium iodide-sodium thiosulfate titration of ozone into sonde form. Further development of any of these sondes seems to be required for extended network use. It would appear that the required development can most readily be accomplished with the Paetzold principle.

Army Signal Research and Development, Fort Monmouth, N. J.
DOUBLE THEODOLITE WIND-MEASURING SET FOR ROCKETS, by A. C. Barichivich, A. E. Weisner and others. 15 Mar 59, 87p. 4 refs. USASRDL Technical rept. 2019; AD-217 543.
Order from LC mi$4.80, ph$13.80 PB 146 265

A double theodolite wind set that provides a low-level wind measurement weighted for rockets was developed. Operational and computational procedures are given. An error analysis was performed, and estimates are presented of set errors under field conditions. (Author)

Army Signal Research and Development Lab., Fort Monmouth, N. J.
THE MEASUREMENT OF TEMPERATURES, DENSITIES, PRESSURES, AND WINDS OVER FORT CHURCHILL, CANADA, BY MEANS OF THE ROCKET GRENADE EXPERIMENT, by W. R. Bandeen, R. M. Griffith and others. 2 Nov 59, 71p. 13 refs. USASRDL technical rept. 2076; AD-228 466.
Order from LC mi$4.50, ph$12.30 PB 147 998

Ten successful Aerobee rocket firings carrying the Signal Corps-University of Michigan rocket-grenade experiment were conducted at Fort Churchill, Manitoba, Canada (59°N). One hundred and fifty-three values of temperatures and winds between 25 and 94 km were measured in summer and winter, both during the day and at night, using the improved tracking and sound-ranging techniques required to make the grenade experiment an all-weather experiment. New facts about the arctic upper atmosphere were revealed. Temperatures in winter are unexpectedly high above

60 km with a second temperature maximum occurring between 70 to 80 km. Summer temperatures as low as 165°K at 80 km were recorded. The temperature maximum lies at about 50 km and in summer is greater than in White Sands, while in winter these temperatures are lower. Densities and pressures were also calculated from these data. The winds show a pattern similar to that in the middle latitudes: strong and westerly in winter, weaker and easterly in summer. (Author)

Army Signal Research and Development Lab., Fort Monmouth, N. J.
UPPER ATMOSPHERE ROCKET SOUNDINGS ON THE ISLAND OF GUAM (IGY PROJECT 10.18) by W. Nordberg. 2 Nov 59, 142p. 9 refs. USASRDL technical rept. 2078; AD-228 443.
Order from LC mi$7.20, ph$22.80 PB 147 999

The performance of the rocket-grenade experiment on Guam during November 1958 is reviewed. Nine rockets (6 Nike-Cajuns and 3 Aerobee 75's) were launched successfully. A total of 43 data points, each representing one value for temperature, wind speed, and direction, was obtained. The measurements were spread over the period between local sunset and sunrise and cover an altitude range from about 30 to 80 km. Radiosonde data below 30 km are available. (Author)

INSTRUMENTATION FOR BALLOON-BORNE INFRARED SPECTRAL TRANSMISSION MEASUREMENTS OF THE ATMOSPHERE, by David G. Murcray, James N. Brooks and others. Scientific rept. no. 3 on Contract AF 19(604)2069. 8 Feb 60, 28p. 5 refs. AFCRC-TN-60-264.
Order from LC mi$2.70, ph$4.80 PB 147 648

Balloon-borne instrumentation for recording atmospheric absorptions of the near infrared from 1μ to 15μ is described and the performance of this equipment on several flights is discussed. (Author)

Denver U., Colo.
A STUDY OF THE 1.4u, 1.9u AND 6.3u WATER VAPOR BANDS AT HIGH ALTITUDES, by David G. Murcray, Frank H. Murcray and others. Scientific rept. no. 4 on Contract AF 19(604)2069. 18 Feb 60, 33p. 8 refs. AFCRC-TN-60-265.
Order from LC mi$3.00, ph$6.30 PB 147 647

On March 13, 1959, the infrared solar spectrum from 1 to 10μ was recorded at altitudes up to 90,000 ft by means of a balloon-borne spectrometer flown in conjunction with a biaxial pointing control. The amount of water vapor present at these altitudes was also measured by means of a frost point hygrometer. The absorptions were calculated for the 1.4μ, 1.9μ and 6.3μ bands using both expressions, the hygrometer data and the laboratory data of Howard et al. Comparison of the calculated and observed absorptions indicates that the expression using $u_e = \int_{h_1}^{h_2} \left(\frac{p}{p_s}\right)^k \rho \, dh$ gives better agreement with the observed values.

Ionospheric Research Lab., Pennsylvania State U., University Park.
VERTICAL INCIDENCE EQUIVALENT HEIGHT RECORDING AT 75 KC/S, by D. J. O'Brien and W. J. Ross. Scientific rept. no. 110 on Ionospheric Research, Contract AF 19(604)3875. 1 Sep 58, 94p. 6 refs. AFCRC-TN-58-637.
Order from LC mi$5.40, ph$15.30 PB 138 261

The results of vertical incidence pulse sounding of the ionosphere at 75 kc/s from October 1955 to February 1957 are presented in tabular form. Median curves are drawn and discussed briefly. Comparisons are made with the records taken previously at 150 kc/s. The main classes of complex echoes are shown and discussed briefly and compared with similar records at 150 kc/s. (Author)

Johns Hopkins U., Baltimore, Md.
THE FIRST AND SECOND POSITIVE BANDS OF N_2, by G. H. Dieke and D. F. Heath. Rept. on Contracts AT(30-1)-1447 and AF 19(604)5516. Dec 59, 194p. 30 refs. Spectroscopic rept. no. 17; AFCRC-TN-60-230; AD-233 489.
Order from LC mi$8.70, ph$30.30 PB 146 250

The first and second positive groups of N_2 were photographed with a low pressure discharge cooled with liquid nitrogen and better resolution achieved than in previous work. The rotational analysis of 21 bands of the first and 9 of the second positive group has yielded the energy levels of $A^3\sum$ to v = 12, of $B^3\Pi$ to v = 18 and of $C^3\Pi$ to v = 4 to within about 0.01 cm^{-1} relative to each other and to within about 1 cm^{-1} with respect to the normal state of the molecule. With these levels the lines in all other bands can be calculated to within the limits of experimental errors. In the second positive group a number of weak satellite branches were found that have not been observed before. Exposures at higher temperatures and an afterglow in argon yielded more information about the perturbations of the $C^3\Pi$ state. The anomalous intensities in these perturbations were interpreted as abnormal occupation of the upper states rather than abnormal transition probabilities. The deviations from thermal equilibrium promise interesting information about the excitation mechanism of the second positive group. (Author)

Lockheed Aircraft Corp., Sunnyvale, Calif.
MEAN ABSORPTION COEFFICIENTS OF AIR, NITROGEN, AND OXYGEN FROM 22,000° TO 220,000°, by B. H. Armstrong. 15 July 59, 81p. 2 refs. LMSD-49759; AD-225 756.
Order from LC mi$4.80, ph$13.80 PB 147 677

The results of calculations of mean electromagnetic radiation absorption coefficients and of the ionic composition of nitrogen, oxygen, and air are described, and graphs of the results presented. The temperature range of the calculations is 2 to 20 ev, and the density range is approximately 10^{-8} to 10^{-2} gm/cm. (Author)

Michigan U. Coll. of Engineering, Ann Arbor.
FALLING-SPHERE INSTRUMENTATION DEVELOPMENT, by J. W. Peterson, D. A. Robinson, and H. F. Schulte. Final rept. on Contract AF 19(604)2415. Feb 60, 87p. 9 refs. 2649-9-F; AFCRC-TR-60-247.
Order from LC mi$4.80, ph$13.80 PB 147 762

Work on the continuing development of the falling-sphere technique for measuring upper-air density and temperature is described. The factors limiting the performance of the transit-time accelerometer were investigated, and a design concept was reached which, it is anticipated, will improve the performance. The data-reduction process for the sphere experiment was completely computerized and is reported. An investigation of the phenomenon of antenna breakdown in flight is described. (Author) (See also PB 143 040)

Stanford Research Inst., Menlo Park, Calif.
IONOSPHERIC ABSORPTION INVESTIGATIONS AT HAWAII AND JOHNSTON ISLAND, by A. Fredriksen and R. B. Dyce. Scientific rept. no. 1 on Contract AF 19(604)3462. Jan 60, 17p. 3 refs. AFCRC TN-60-136; AD-233 726.
Order from LC mi$2.40, ph$3.30 PB 146 325

Measurements of ionospheric absorption by the cosmic-noise monitoring method show that, at certain tropical latitudes, an irregular component of absorption is often present in the evening hours. If the variable absorption is present at one observing site (Johnston Island), then variations are also likely to be present at another station about 1325 kilometers away (Hawaii). However, the individual variations of absorption as a function of time are not correlated at the two stations, suggesting that the scale of the patches causing the absorption must be less than about 1000 kilometers.

ENGINEERING

Brown U. Div. of Applied Mathematics, Providence, R. I.
LIMIT STRENGTH OF THIN WALLED PRESSURE VESSELS WITH AN ASME STANDARD TORISPHERICAL HEAD, by R. T. Shield and D. C. Drucker. Technical rept. no. 31 on Contract Nonr-562(10). Feb 58, 27p. 8 refs. C11-31.
Order from LC mi$2.70, ph$4.80 PB 138 132

Results are presented for the maximum pressure an unfired vessel with an ASME standard torispherical head can withstand before appreciable plastic deformation will occur. The effect of flanges on strength is considered. Although the procedures outlined permit variation of pressure in the axial direction to be taken into account fully, for convenience the calculations are based upon the assumption of uniform interior pressure. Work-hardening is not of much significance for thin-walled vessels of the usual steels and is ignored.

Aeronautical Accessories Lab., Wright Air Development Div., Wright-Patterson AFB, Ohio.
THE RESPONSE OF MECHANICAL SYSTEMS TO RANDOM VIBRATION AS DETERMINED BY ANALOG COMPUTER, by Virgil Clinton McIntosh. Rept. on Environmental Simulation Methodology. Feb 60, 49p. 9 refs. WADC Technical note 59-193.
Order from OTS $1.25 PB 161 794

This report is concerned with the determination of the responses of mechanical systems to random vibration. Systems are chosen which are difficult or impractical to analyze by analytical methods but which may be conveniently analyzed by an electronic analog computer. The responses of nonlinear single-degree-of-freedom systems and linear two-degree-of-freedom systems to both random and sinusoidal vibration are determined, and the inputs required to produce equal root-mean-square responses are compared. For the three types of nonlinearities studied, increasing the nonlinearity causes the rms response to a random input to increase relative to the response to a sinusoidal input. In a two-degree-of-freedom system, varying the mass ratio or the damping ratio causes similar effects in the response to either sinusoidal or random inputs. (Author)

Air Force Cambridge Research Center [Bedford] Mass.
THE SUPPRESSION OF AIRCRAFT EXHAUST TRAILS, by C. E. Anderson. Nov 54, declassified 18 Jan 57. 43p. 18 refs. Air Force Surveys in Geophysics no. 58; AFCRC-TN-54-24.
Order from LC mi$3.30, ph$7.80 PB 148 035

The suppression of contrails appears to be possible theoretically by controlling the amount of water in the exhaust gases. From an examination of the effect such control systems would have on engine performance, it does not seem possible to restrict the water without serious interference. Present trends in turbo-jet engineering offer little hope in the way of increased temperature/water ratio in the exhaust gases, at least for the next ten years. A possible solution may be the development of methods to control the size and number of condensation particles.

Army Engineer Waterways Experiment Station, Vicksburg, Miss.
CRITERIA FOR DESIGNING RUNWAYS TO BE SURFACED WITH LANDING MAT AND MEMBRANE-TYPE MATERIALS, by A. B. Thompson and C. D. Burns. Apr 60, 88p. 1 ref. Technical rept. no. 3-539.
Order from LC mi$4.80, ph$13.80 PB 147 738

Accelerated traffic tests simulating aircraft taxiing operations were conducted on test sections, having a range of subgrade and base course strengths, that represented unsurfaced or membrane-surfaced airstrips and runways surfaced with standard M6, M8, and M9 landing mat. Load carts applied traffic simulating single-wheel loads of 10,000 to 50,000 lb (tire pressures of 40 to 300 psi) and multiple-wheel assembly loads of 50,000 and 100,000 lb. CBR, water content, and density of base and subgrade before and during traffic, and behavior of the test sections were recorded. Traffic continued until test section failed or until 700 coverages had been completed. Design curves, developed by applying the test data to bituminous pavement design curves, are considered adequate for use in designing landing strips surfaced

with M6 or M8 mat, and for properly fabricated M9 mat. Curves applicable for unsurfaced or membrane-surfaced strips, and curves for estimating surface-strength requirements for 1 to 100 coverages of such strips were also developed. (Author)

Army Ordnance Human Engineering Labs., Aberdeen Proving Ground, Md.
DETECTION OF RANDOM LOW-ALTITUDE JET AIRCRAFT BY GROUND OBSERVERS, by William Wokoun and Otho C. Wolfe. June 60, 56p. 6 refs. Technical memo. 7-60.
Order from LC mi$3.60, ph$9.30 PB 147 962

This study investigated the efficiency of the human ground observer in detecting and identifying jet fighter aircraft, as a function of size of sector observed and aircraft altitude, when targets appeared essentially at random. Particular emphasis was place on allowing the subjects minimal information about when and where aircraft might appear. The evaluation included four search sector sizes (360°, 180°, 90°, and 45°). Three types of jet aircraft (T-33, F-86, and F-100) approached along six courses at two altitudes (500 and 1500 feet). Results include cumulative probability curves indicating the likelihood that aircraft will be detected or identified at any given distance for the various combinations of search sector size and altitude, as well as supplementary analyses of day-to-day variations in detection efficiency, the effect of intertrial interval, variation due to aircraft course and terrain, variation due to cross-over range, and accuracy of identification. (Author)

Bell Helicopter Corp., Fort Worth, Tex.
PERFORMANCE AND WEIGHT AND BALANCE SUBSTANTIATION FOR THE TWO-PLACE OBSERVATION HELICOPTER STUDY, by A. Shultz and G. Osborne. Rept. on Contract DA 44-177-tc-420. 30 Sep 57, declassified 28 Apr 58, 75p. 8 refs. Rept. no. D233-099-002.
Order from LC mi$4.50, ph$12.30 PB 146 337

This report presents the methods and analysis used for performance and weight evaluation of the Two-Place Observation Helicopter Study. (See also PB 146 338)

Bell Helicopter Corp., Fort Worth, Tex.
TWO-PLACE OBSERVATION HELICOPTER DESIGN STUDY, by John A. DeTore. Summary rept. on Contract DA 44-177-tc-420. 29 Oct 57, declassified 28 Apr 58, 118p. Rept. no. D233-099-001.
Order from LC mi$6.00, ph$18.30 PB 146 338

This report summarizes the results of the design study of inexpensive, lightweight, helicopters to meet the Army Two-Place Observation Helicopter requirements. The following three solutions are discussed in detail. (1) A modified H-13H helicopter powered by a Lycoming VO-435 piston engine derated to 200 hp. Gross weight is 2256 lbs. (2) The D233, a smaller helicopter, having a 28 ft diameter rotor and powered by a Lycoming O-360 piston engine rated at 180 hp - NRP. Gross weight is 1693. (3) The D234, a still smaller helicopter, having a 25 ft diameter rotor and powered by a Lycoming PLT 11E-1 free turbine engine rated at 233 hp - NRP. Gross weight is 1637 lbs.

Bolt, Beranek, and Newman, Inc., Cambridge, Mass
PERFORMANCE OF INTENSE ACOUSTIC FACILITY FOR FLIGHT VEHICLE AND ELECTRONIC RESEARCH, by George W. Kamperman, Clayton H. Allen and others. Rept. for May-Oct 59 on Aeroelasticity, Vibration and Noise, Contract AF 33(616)5274. Mar 60, 42p. WADD Technical rept. 59-12.
Order from OTS $1.25 PB 161 781

A unique sonic failure research facility has been constructed for testing flight vehicle structures and electronic systems in the presence of high intensity sound. The siren sound source will produce pure tones or narrow bands of noise throughout the frequency range from 50 to 10,000 cps with controlled amplitude modulation from 0 to 50 cps. The maximum acoustic power output is 22,000 w to produce a sound pressure level of approximately 174 db in the 1 ft square progressive-wave test section. This report discusses the performance of the facility. (Author)

A STUDY TO INVESTIGATE ALL PROBLEMS RELATED TO A TACTICAL HIGH DENSITY LANDING SYSTEM FOR THE PURPOSE OF RECOMMENDING A SYSTEM WHICH WILL FULFILL THE ARMY'S REQUIREMENTS IN 1962, by R. T. Brumbaugh. Quarterly progress rept. no. 1, 15 June-1 Dec 59, on Contract DA 36-039-sc-84513. [1959] 29p. P-1842.
Order from LC mi$2.70, ph$4.80 PB 147 413

This report deals with the preliminary investigation of the operating environment which may be expected for Army air operations in the post-1962 tactical situation. From this investigation the requirements for an Interim High Density Landing System will be resolved. Principal requirements of the system will be the ability to land two aircraft per minute, the capability to handle all types of Army aircraft, and all-weather operation. Concern is given to the various situations which may be encountered as well as the various aircraft and electronic equipments which may be employed. (Author)

BOUNDARY-LAYER DISPLACEMENT AND LEADING-EDGE BLUNTNESS EFFECTS IN HIGH TEMPERATURE HYPERSONIC FLOW, by H. K. Cheng, J. Gordon Hall and others. Rept. on Contract AF 18(603)10. Jan 60, 82p. 66 refs. Rept. no. AD-1052-A-9; AFOSR TN-59-1193; AD-233 867.
Order from LC mi$4.80, ph$13.80 PB 146 370

Two important features of hypersonic flow over slender or thin bodies are the displacement effect of the boundary layer and the large downstream influence of leading-edge bluntness. The present paper contributes new theoretical and experimental results on this problem.

Lockheed Aircraft Corp. [Burbank, Calif.]
HIGH ENERGY RATE METAL FORMING, by A. F. Watts and Glen N. Rardin. Interim technical engineering rept. no. 7, 1 Oct-31 Dec 59, on Contract AF 33(600)35543. [1960] 17p. LR 14204; AD-231 387.
Order from LC mi$2.40, ph$3.30 PB 146 287

The hoop stresses induced in the walls of a small water filled explosive forming tank with various insulating materials are presented. Air, as an energy absorbing medium, was found to be the most effective. (Author) (See also PB 144 411)

National Research Labs., Ottawa (Canada).
A COMPARISON BETWEEN THE SPANWISE AND CHORDWISE SHEDDING METHODS OF ROTOR BLADE DE-ICING, by J. R. Stallabrass and G. A. Gibbard. Jan 60, 39p. 4 refs. Aeronautical rept. LR-270.
Order from LC mi$3.00, ph$6.30 PB 147 504

Flight tests in an artificial icing cloud were made on two sets of helicopter rotor blades equipped with deicing heater mats embodying the spanwise and chordwise shedding principles. The tests demonstrated a decided performance advantage for the spanwise shedding systems, although the chordwise shedding system had the advantage of greater constructional simplicity. (Author)

THE ICING OF DELTA WINGS OF UNITY ASPECT RATIO HAVING LEADING EDGE SEPARATION, by C. K. Rush. Dec 59, 40p. 6 refs. Aeronautical rept. LR-268.
Order from LC mi$3.00, ph$6.30 PB 147 537

Tests were made in an icing wind tunnel of two models, and the resulting ice formations are described and illustrated. The significance of scale is discussed, and it is shown that the tests are representative of icing conditions with large droplets and high speeds. (Author)

National Research Labs., Ottawa (Canada).
TURBOJET THRUST AUGMENTATION: FLIGHT MEASUREMENTS OF THE TURBINE BLADE COOLING ACCOMPANYING THE PRE-TURBINE INJECTION FUEL WITH AN ORENDA 14 ENGINE IN A SABRE 6 AIRCRAFT, by E. P. Cockshutt, G. G. Levy, and C. R. Sharp. Jan 60, 47p. 5 refs. Aeronautical rept. LR-271
Order from LC mi$3.30, ph$7.80 PB 147 333

Turbine blade temperature data, obtained with a thermocouple-slipring instrumentation system, are presented for an Orenda 14 engine, which was flight tested both with and without reheat at altitudes ranging from 20,000 to 50,000 feet. The blade temperatures in the unreheated engine were found to be determined primarily by the variation in the turbine outlet (gas) temperature with flight condition. The first-stage turbine blades were cooled by the pre-turbine injection of the reheat fuel by a maximum of 150°C under sea-level-static conditions; as had been predicted from simple heat transfer theory, the maximum cooling declined to about half this value at 50,000 feet. No significant cooling of the second-stage turbine blades was detected at any flight condition. The instrumentation system operated without serious difficulties throughout the test program. (Author)

INVESTIGATION OF A LONG-BURNING PLASTIC-BONDED, COLORED-SMOKE MIXTURE, by Woodrow W. Reaves and John H. Hassmann. Jan 60, 22p. CWLR 2339; AD-233 750.
Order from LC mi$2.70, ph$4.80 PB 147 627

The object of the work described in this report was to develop a long-burning, plastic-bonded, colored-smoke formulation that could be adapted for use in the Naval Floating Drift Signal, Mark 7. Various polyester resins were investigated for use as binders and fuels for pyrotechnic smoke mixtures. Mixtures capable of extrusion into various configurations were investigated to obtain longer burning times. (Author)

Battelle Memorial Inst., Columbus, Ohio.
EVALUATION OF THE ZONE-PURIFICATION PROCESS AS A METHOD OF PREPARATION OF PORTABLE WATER FROM SEA WATER, by R. C. Himes, S. E. Miller and others. Rept. on Contract no. 14-01-001-80. May 60, 32p. Office of Saline Water Research and Development rept. no. 36.
Order from OTS $1.00 PB 161 818

Experimental evidence has definitely linked periodic salt entrapments (characteristically observed along ingots grown in this research program) with breakdown of constitutional supercooling. The shape of the solid-liquid interface and crystallization rates at various solution concentrations are important factors in the zone

refining and directional freezing of salt water. Crystallization-rate studies have established an upper limit for the growth rate of ice crystals from salt solutions. The technical feasibility of multiple-stage zone-freezing conversion of sea water has been demonstrated. Preliminary engineering evaluation of several multiple-stage, continuous freezing systems has indicated that at least one may be economically feasible.

Blaw-Knox Co., Pittsburgh, Pa.
SALINE WATER CONVERSION BY DIRECT FREEZING WITH BUTANE, by George Karnofsky and Paul F. Steinhoff. Rept. for 29 June-30 Oct 59 on Contract no. 14-01-001-176. 1 July 60, 78p. Office of Saline Water Research and Development Progress rept. no. 40.
Order from OTS $2.00 PB 161 819

This report includes an engineering study, and laboratory work on which the study is based, of a plant to produce 10,000,000 gallons per day of fresh water from sea water. The process is that of direct freezing brought about by the evaporation of a hydrocarbon refrigerant (butane) in contact with sea water; washing the ice free of saline liquor; and melting the ice to potable water by the condensation of butane vapor. The results of the engineering study showed that the total cost, conservatively estimated for a plant based on electric motor drive, is $10,524,000, and the corresponding cost of producing fresh water is 55.5 cents per 1000 gallons. For a plant based on gas engine drives for the compressors, the capital investment is $11,874,000, and the cost of water produced is 50.7 cents per 1000 gallons.

Massachusetts Inst. of Tech., Cambridge.
THE EVAPORATION OF WATER AT HIGH HUMIDITIES, by Thomas K. Sherwood and Oliverio Phillips. (Doctoral thesis). Final rept., Part III, on Mass Transfer into Gas Streams at Low Pressures and High Velocities, Contract DA 19-020-ORD-3244. 15 Apr 57, 233p. 87 refs. OOR rept. no. 887 4C; AD-133 277.
Order from LC mi$10.20, ph$36.30 PB 147 856

An investigation was made of the factors by which changes in concentration of the diffusion compound affect the rates of mass transfer between a gas and a wet surface. A 2-ft-long, 0.813-in.-id glass wetted-wall tower and a kieselguhr porous wet cylinder 0.658 in. in diameter and 1.069 in. long were used to study the evaporation of water into steam-air mixtures. The results obtained in both the wetted-wall tower and the wet cylinders indicated that concentration changes affect the turbulent and molecular transfer processes and confirm the inverse proportionality between k_G and p_{BM}. A theoretical discussion of diffusion in the evaporation process is presented. Negligible liquid film resistance to mass transfer in the wetted-wall tower was observed.

INVESTIGATION OF THE ADEQUACY OF CONSTRUCTION EQUIPMENT AND TECHNIQUES UNDER ARCTIC WINTER CONDITIONS FOR ROADS AND AIRFIELDS CONSTRUCTION PURPOSES, by Paul A. Beigbeder and Stanley H. Robertson. 2 Nov 54, 46p. 1 ref. Rept. 1380; AD-67 311.
Order from LC mi$3.30, ph$7.80 PB 148 052

An investigation was conducted (1) to develop a suitable cross section for use in constructing expedient roads and airfields during the winter in permafrost regions using frozen road materials; and (2) to determine the limitations of the available equipment in excavating and placing frozen road materials. Traffic tests were conducted on 5 test lanes which were constructed with frozen soils excavated from 2 borrow pits. Sieve and water (ice) analyses were carried out and thermocouples were installed in the test lanes. Meteorological data were recorded. Results indicate that (1) frozen borrow material cannot be loosened and disaggregated sufficiently and economically by explosives to satisfy the requirements of handling and placing without additional processing; (2) the most expedient method for loosening frozen gravel in the borrow pits was by rooters; (3) the available rooting equipment was inadequate for excavating frozen silty soils; (4) the most suitable method for hauling and placing fill material in the roadway was by trucks; (5) the most expedient method of loading trucks was by dipperstick shovel from stockpiles; (6) the sheepsfoot roller and the wobble-wheel roller were ineffective in compacting or disaggregating frozen gravel material; (7) the need for material such as logs, landing mats, brush, and the like, to support a fill was not required (provided the muskeg was in a frozen state); and (8) a 6-ft gravel fill on a frozen muskeg will keep the muskeg at a freezing temperature, or slightly above, for a shallow depth during thaw periods.

MAINTENANCE MANAGEMENT OF PUBLIC WORKS AND PUBLIC UTILITIES. Dec 59, 144p. NAVDOCKS P-321.
Order from LC mi$7.20, ph$22.80 PB 147 656

This publication has been prepared as an aid for naval and civilian personnel concerned with the maintenance management of public works and public utilities at shore activities of the Naval Establishment. Controlled Maintenance, as outlined in this publication, is the application of proven management and industrial engineering principles to the maintenance and operation of public works and public utilities. The significance of Controlled Maintenance is explained, as are the basic concepts, elements of control, and extent of control. Also included are procedures and other criteria to assist in the implementation of Controlled Maintenance.

MAP DEVELOPMENT FOR ADVANCED RADAR SIMULATION TECHNIQUES, by Walther Barth. Rept. on Contract AF 33(600)31911. Feb 60, 83p. 36 refs. WADC Technical rept. 58-165.
Order from OTS $2.25 PB 161 795

Five basic considerations are treated separately as individual reports. The first describes and develops arithmetic progressions for densities, transmittances

and opacities, and calculates the densities sequences required, relating them to practical densities. An overlay is developed for use on the sensitometric curve, to obtain the progression of transmittances or opacities. In the second report the Densitometer is described and methods of use to eliminate errors are explained. The method of measuring densities on the photographic plate type map is described. The third report describes the method of development and fixing used for the photographic plate to achieve uniformity. The fourth report describes a method of obtaining a predetermined gray scale by paint mixing, in which is described an improved mixing sequence termed the Successive Mixing Method, which aids in eliminating errors and results in greater uniformity of the gray scales. The fifth report discusses the errors affecting the photographic reproduction and describes the principles for compensating variations in the reproduction and describes the principles for compensating variations in the reproduction. An emulsion is recommended which has the density range within the straight line portion of the sensitometric curve. (Author)

TELEMETRY SYSTEM STUDY. VOLUME I (of III). ANALYSIS AND DESIGN, by J. G. Hammond, W. F. Link and others. Final rept. v. 1, 6 Feb 57-30 Nov 59, on Contract DA 36-039-sc-73182. 18 Dec 59, 283p. [30] refs. Publication no. U-743.
Order from LC mi$11.10, ph$44.10 PB 147 919-1

A telemetry system study has been conducted to evaluate both experimentally and analytically the performance capability and potential of standard systems and to provide a design plan for an improved telemetry system. The results of the program are reported in three volumes. Volume I contains an analysis of each of the four basic systems: PCM-FM, PDM-FM, FM-FM, and PAM-FM. The analyses have been developed and verified experimentally to provide a means for determining the performance of each of the systems and to permit system parameters to be adjusted for optimum performance. The criteria for comparing the relative performance of the several systems are derived and the comparisons are presented. It is shown that PCM-FM and PAM-FM are superior to PDM-FM and FM-FM for the majority of anticipated applications. A conceptual design of a system which is recommended for development is described. Basically, the system employs a combination of PAM-FM and PCM-FM techniques in a configuration which enables the telemetry user to accommodate a wide variety of data economically and practically. Airborne Instruments Lab., Inc., Mineola, N. Y.
FABRICATION OF ENGINEERING MODEL OF RADAR SET AN/FPN-31(XW-1) (AIRPORT SURFACE DETECTION EQUIPMENT), by Joseph E. Woodward and Bruce A. Woodward. Final engineering rept. on Contract AF 30(602)296. Mar 57, 46p. 6 refs. Rept. no. 2388-1; RADC TR-57-87; AD-114 474.
Order from LC mi$3.30, ph$7.80 PB 146 375

Design details, layout, fabrication, and testing of the FPN-31(XW-1) radar set were completed. The radar set comprises 3 major units: (1) a transmitter-receiver group containing the radar transmitter, receiver, and associated circuits; (2) an indicator group containing the PPI display and associated circuits; and (3) an antenna group containing a radar antenna, a radome, and associated components. System tests demonstrated that the model system meets specifications. The antenna has an azimuth beamwidth of 0.25° and a vertical coverage that extends to 25° below the peak with no holes. Circular polarization was very effective against rain return. A satisfactory air-inflated radome is available to cover the antenna. The transmitter and receiver demonstrated satisfactory performance, and the stable and effective AFC circuit is trouble-free. Operation of the indicator was satisfactory and provided a stable display with good resolution and azimuth repeatability. There are no components in the radar that are in critical supply. Magnetrons for use in the transmitter are available from at least 2 sources and provide satisfactory electrical performance; more data are needed on the life performance of magnetron types QK511 and 6551 when operated at the short-pulse duration. The radome was satisfactory in electrical and mechanical performance, but more experience is required to determine the expected service life.

Airborne Instruments Lab., Deer Park, N. Y.
INVESTIGATION OF MULTIFEED ANTENNAS AND WIDE-ANGLE OPTICS, by C. A. Bergren, L. J. Kuskowski, and W. D. White. Rept. on Contract AF 30(602)1980. Mar 60, 40p. 7 refs. Rept. no. 7358-I-4; RADC-TN-60-92.
Order from LC mi$3.00, ph$6.30 PB 147 836

The Cassegrain antenna system has yielded a partial solution to the problem of designing a wide-angle multifeed antenna. Although design data has been obtained for the Cassegrain antenna, the problem of reducing side lobes due to aperture blocking still remains. Several methods that utilize the blocking aperture to reduce side lobes have been investigated. The Schwarzschild antenna system--another two-

refining and directional freezing of salt water. Crystallization-rate studies have established an upper limit for the growth rate of ice crystals from salt solutions. The technical feasibility of multiple-stage zone-freezing conversion of sea water has been demonstrated. Preliminary engineering evaluation of several multiple-stage, continuous freezing systems has indicated that at least one may be economically feasible.

The transmitter and receiver demonstrated satisfactory performance, and the stable and effective AFC circuit is trouble-free. Operation of the indicator was satisfactory and provided a stable display with good resolution and azimuth repeatability. There are no components in the radar that are in critical supply. Magnetrons for use in the transmitter are available from at least 2 sources and provide satisfactory electrical performance; more data are needed on the life performance of magnetron types QK511 and 6551 when operated at the short-pulse duration. The radome was satisfactory in electrical and mechanical performance, but more experience is required to determine the expected service life.

Airborne Instruments Lab., Deer Park, N. Y.
INVESTIGATION OF MULTIFEED ANTENNAS AND WIDE-ANGLE OPTICS, by C. A. Bergren, L. J. Kuskowski, and W. D. White. Rept. on Contract AF 30(602)1980. Mar 60, 40p. 7 refs. Rept. no. 7358-1-4; RADC-TN-60-92.
Order from LC mi$3.00, ph$6.30 PB 147 836

The Cassegrain antenna system has yielded a partial solution to the problem of designing a wide-angle multifeed antenna. Although design data has been obtained for the Cassegrain antenna, the problem of reducing side lobes due to aperture blocking still remains. Several methods that utilize the blocking aperture to reduce side lobes have been investigated. The Schwarzschild antenna system--another two-

reflector system--is being investigated to determine its scan capabilities. The reflectors for this system are designed such that first order coma and spherical aberration are minimized over the necessary scan angles. Preliminary results have indicated that the Schwarzschild antenna system will yield scanning performance superior to that of the Cassegrain system. (Author)

American Inst. for Research, Pittsburgh, Pa.
PRINCIPLES AND PRELIMINARY RECOMMENDATIONS FOR A CORE SYSTEM OF NAVY RADAR OPERATOR TRAINING DEVICES, by Richard O. Peterson, Leon J. Lewandowski, and Angustus D. Daily. Rept. on Contract N61339-348. 2 Mar 60, 105p. 89 refs. Technical rept. NAVTRADEVCEN 348-1.
Order from LC mi$5.70, ph$16.80 PB 146 397

Investigation was made of the feasibility of developing a core of radar operator training devices of a general nature which could be used for training in a multiplicity of specific radar equipments and skills. Naval radar operator jobs were analyzed to determine the job contents which are common to many radar operator jobs. This resulted in a core of the skill and knowledge requirements which are basic to many radar operator jobs. From a rational analysis of the skill and knowledge requirements and of the equipment and training data collected, equipment design principles applicable to the design of radar operator training devices were derived. Preliminary recommendations for devices which would comprise a core training device system for radar operators were developed. (Author)

PROCEEDINGS OF THE CONFERENCE [NO. 5] ON RADIO INTERFERENCE REDUCTION AND ELECTRONIC COMPATIBILITY HELD AT THE MUSEUM OF SCIENCE AND INDUSTRY, CHICAGO, ILLINOIS, OCTOBER 6-8, 1959. Oct 59, 697p. 118 refs.
Order from LC mi$11.10, ph$105.90 PB 148 074

Contents: Advanced technology and future problems in radio interference; spectrum utilization in a field army; the role of CISPR (International Special Committee on Radio Interference) in radio interference reduction and control; low noise devices as systems elements; susceptibility of pyrotechnic devices to electromagnetic energy; prediction factors influencing transmitter power spectrum; sensitivity of predicted interference to propagation model and spectrum availability; the construction of Mutual Interference Charts (MIC'S) and some statistical properties of the entries; processing of non-symmetrical mutual interference matrices; design of electromagnetic interference reduction; using computer simulation techniques; radio noise testing of the Lockheed Electra; interference implications of a commercial communications satellite system; measurements of spurious emission from an AM/EM tuner in accordance with Part 15 of the FCC Rules and Regulations; spurious responses of television receivers in the 300 to 1000 mc. region; investigation of corona noise in a three-phase transmission line; a thermistor bridge voltmeter for calibrating interference measuring instruments; application of the low noise traveling wave tube to interference instrumentation; a coaxial device for measuring the performance of shielding materials; a method of measuring high power transmitter cabinet and external wiring radiation; radio interference testing of large-scale computing systems-theory and practice; the effect of climatic environments on radio frequency interference; design of a wire communication system in a shielded passageway of the BMEWS radar system; planning interference-free communications-

electronics systems; procedure and problems inherent to interference testing of the B-58 aircraft; the systems approach in designing a specification for the control of radio interference in an airborne complex; some interesting aspects of interference and spurious signal measurements at the Army Transmitting Station Woodbridge, Virginia; radio interference detection system at Atlantic Missile Range (AMR); the gain of aperture antennas at spurious frequencies; Fresnel region patterns and gain corrections of large rectangular antennas; new techniques for evaluating the performance of shielded enclosures; contiguous wrapping of transmission line conductors with high-mu tape for large radio-interference attenuation; characteristics of microwave duplexer tubes under spurious radiation conditions; a method of evaluating the effectiveness of radio-frequency gasket materials; a transient suppressor for protection of transistorized equipment in 27 v D.C. aircraft electrical systems; relay noise suppression in airborne electronic systems; a method of assigning compatible frequencies to ground UHF radios in a transitional environment (Unclassified paper) (See also PB 148 073)

Army Ballistic Missile Agency, Redstone Arsenal, Ala.
CAPACITY DIODE PARAMETRIC PERFORMANCE AND CIRCUIT DESIGN BY A FINITE CURRENTS METHOD, by Alan J. Fisher. 19 Jan 59, 34p. Rept. no. DG-TR-1-59; AD-216 182.
Order from LC mi$3.00, ph$6.30 PB 146 270

If a finite number of sinusoidal currents rather than voltages are permitted to exist in a capacity diode parametric device, the performance will be more efficient and more easily calculated. A two-current analysis of frequency doubling (and halving) is presented which shows the relationships between efficiency and power and diode cutoff frequency. Input and output coupling circuits which approximate the two-current analysis are shown. The analytic results are used to predict the generation of watts of efficient microwave power by all solid state devices. Finally, the extension of the finite currents method to higher harmonics and parametric mixers, amplifiers and oscillators is discussed. (Author)

Army Signal Missile Support Agency, White Sands Missile Range, N. Mex.
AN/DRW-11 (XE-1) RECEIVER SPECTRUM UTILIZATION, by Merwin A. Olson and Charles E. Hyman. 15 Apr 60, 55p. AFC rept. #DC 15-4-60 RdeC.
Order from LC mi$3.60, ph$9.30 PB 147 521

Results are presented of a laboratory investigation of an AN/DRW-11 FM (406 - 450 MCS) receiver to determine its spectrum utilization and interference susceptibility characteristics; this information is necessary to allow for efficient frequency allocation. Operating characteristics such as frequency stability, sensitivity, selectivity, spurious responses, spurious emissions, audio characteristics; interference characteristics, and antenna input VSWR were tested. Frequency stability was found to be within 0.002% and the 3 db overall selectivity was 342 KCS. In the frequency range from 150 KCs to 10 KMCS there were eleven spurious responses less than 60 db down; of these responses only one was below 2500 MCS (410 MCS at 54 db down). Five radiated emissions were found to be in excess of MIL-I-26600 limits for Class I equipment. (Author)

Army Signal Missile Support Agency, White Sands Missile Range, N. Mex.
ASCOP TK-M7 TELEMETRY TRANSMITTER SPECTRUM UTILIZATION, by Charles R. Wise and Merwin A. Olson. 15 Apr 60, 49p. AFC Rept. TM-15-4-60-T.
Order from LC mi$3.30, ph$7.80 PB 147 742

Frequency stability, power output, modulation sensitivity, and deviation were tested with respect to supply voltage, operating time and environmental conditions; interference characteristics (antenna conducted and radiated spurious emissions) were also examined; all tests were empirical in nature. All spurious emissions (antenna conducted), except one at 202 MCS (54 db down) and four harmonics of the fundamental, were within the requirements of WSMR Regulation Nr. 600-5-59. Frequency stability was within the required 0.01% except for: supply voltage reductions of more than 15%, prolonged exposure to high altitudes, and certain conditions of acceleration in excess of 15 G's. This transmitter is compatible with the 0.5 MCS channelization, as per WSMR Regulation 600-5-59. (Author)

APPLICATION OF AUDIO TRANSFORMER DESIGN METHOD OUTLINED IN FINAL REPORT IN CONTRACT NO. W36-039-sc-38268. "TRANSFORMER DESIGN CRITERIA AND DATA", by Irving Remis. 28 May 52, 22p. Technical memo. no. M-1429.
Order from LC mi$2.70, ph$4.80 PB 148 544

It is the purpose of this report to present a sample design complete with curves and other pertinent information to act as a guide for engineers with little experience in transformer design.

Army Signal Research and Development Lab., Fort Monmouth, N. J.
COMPLEMENTARY TRANSISTOR MODULATOR, by J. Grau and B. Humbel. 1 Oct 59, 35p. 2 refs. USASRDL technical rept. 2068; AD-230 739.
Order from LC mi$3.00, ph$6.30 PB 148 115

A recent preliminary investigation of modulator circuits using two complementary transistors revealed that this type of modulator offers some unique features not found in other types of modulators. These are: (1) no dc supply voltage necessary as the carrier furnishes the supply voltage for operation, (2) carrier suppression, (3) elimination of the use of a balance transformer, (4) accomodation of dc input and output signals, (5) offers a power gain as high as 3 db, as compared to other modulations which usually have an insertion loss, and (6) compactness in size (only two transistors and one transformer necessary) These advantages open a broad field of applications, e.g. its use in carrier frequency equipment, single sideband equipment, etc. Modulator circuits using 2 complementary transistors are investigated; condi-

tions to be fulfilled for working configurations are established; test results of 2 modulator configurations are given; and the theory of operation is explained. (Author)

AN EXPERIMENTAL PULSE REPEATER FOR TRANSMISSION OF INVERTED BINARY PULSE SIGNALS OVER FIELD WIRE, by H. Wolf. 1 Oct 59, 36p. 7 refs. USASRDL technical rept. 2082; AD-232 489.
Order from LC mi$3.00, ph$6.30 PB 148 117

The problems connected with the transmission of a one megabit binary pulse signal over field wire WD-1/TT are discussed. The inverted binary pulse signal is introduced and the design of a repeater for inverted binary pulses is described. The results of cascading a series of these repeaters are shown. It is concluded that the lack of an inexpensive and reliable retiming circuit is a problem which requires further study. (Author)

PROCEEDINGS OF THE SYMPOSIUM ON SOLID STATE MASERS, 12-13 JUNE 1958, HELD AT FORT MONMOUTH, NEW JERSEY. [1958] 105p. 28 refs. AD-217 741.
Order from LC mi$5.70, ph$16.80 PB 147 977

Contents:
Spin-spin interactions in potassium cobalti-chromicyanide
Some performance characteristics of solid-state masers
Relaxation measurements of Cr^{3+} in Al_2O_3
Recent developments in solid-state masers at Lincoln Laboratory
Some aspects of traveling-wave masers
Spontaneous emission into a single mode
Raman-type masers
Design of a maser amplifier for radioastronomy at 3 centimeters wavelength
Possible maser application of titanate host crystals
Proposal for a maser-amplifier system without non-reciprocal elements
Amplification and oscillation in two-level spin systems
Variation of crystal-field splitting by host-ion substitution in nickel double nitrates
Experiments with pulsed two- and three-level solid-state masers
Development of ruby maser at Willow Run Laboratories and future program
The necessary requirements for low-noise devices in radar and radiometry
Application of solid-state maser to fire control radar

SOLID TANTALUM CAPACITORS, by Albert Lunchick. 1 Oct 59, 17p. USASRDL technical rept. 2073.
Order from OTS $0.50 PB 161 821

The capabilities and limitations of the solid tantalum capacitor with respect to operating temperatures, electrical leakage, dissipation factor, stability, and life are summarized and illustrated. (Author)

Ballistic Research Labs., Aberdeen Proving Ground, Md.
THE USE OF NETWORK TOPOLOGY WITH ACTIVE CIRCUITS, by Keats A. Pullen, Jr. Feb 60, 97p. 54 refs. Rept. no. 1096.
Order from LC mi$5.40, ph$15.30 PB 147 649

The application of the theory of linear graphs, or topology, to passive and active networks is reviewed, and some simplifications to the determination of equations for current and voltage gain are discussed. The calculation of the minimum number of network trees required to represent active networks is considered, and methods of simplifying the establishment of the required trees is examined. In addition, the active equations for the parametric amplifier are derived topologically. (Author)

AUTOMATIC MACHINE FOR SEALING OF QUARTZ CRYSTAL UNITS, by Robert J. Bibbero and R. Giglio Tos. Quarterly progress rept. no. 2, 25 Sep-24 Dec 57, on Contract DA 36-039-sc-72775. [1957] 25p.
Order from LC mi$2.70, ph$4.80 PB 137 443

An experimental run of HC-6/U cans and bases designed for projection weld sealing was ordered for evaluation in conjunction with commercial welding machines. Studies of machine layout and human task factors, together with automatic welding transport mechanisms, have been made which favor a rotary table mechanism. Vacuum pump-down calculations have been made and have led to a minimum pump size, for adequate chamber capacity, of 15 cfm with 0.1 micron ultimate vacuum. Present system capacity is estimated as 215 units per hour. (Author) (See also PB 137 444)

California U., Los Angeles.
ON THE PHILOSOPHY OF ADAPTIVE CONTROL FOR PROCESS ADAPTIVE SYSTEMS, by M. Margolis and C. T. Leondes. Rept. on Contract AF 49(638)438. Jan 60, 18p. 6 refs. AFOSR TN-59-1199; AD-233 499.
Order from LC mi$2.40, ph$3.30 PB 146 376

A very general approach is described to the design of process adaptive systems. A brief look is taken at the development of feedback control theory and practice. Then process adaptive control is discussed as a logical extension of the basic concepts of feedback theory. A particular mechanism for process adaptive control is suggested. This mechanism makes use of a learning model whose form is the same as the physical process and whose parameters are continually adjusted so that the model and process behave as much alike as possible. The parameters of the model are used to set the parameters of the controller for the overall control of the system. (Author) (See also PB 144 769)

Clevite Transistor Products, Waltham, Mass.
RESEARCH AND DEVELOPMENT OF GERMANIUM PNP JUNCTION SWITCHING TRANSISTORS, by Paul L. Meretsky. Progress rept. no. 5 (final), 10 May 58-9 Aug 59, on Contract DA 36-039-sc-75060. [1959] 74p. AD-232 673.
Order from LC mi$4.50, ph$12.30 PB 147 973

The following conclusions may be drawn from work accomplished: While the original specification was met on a developmental basis, some relaxations (saturation and thermal resistance) are required in order to make the device on a production basis. The thermal resistance will be somewhat compensated by a reduced low voltage Ico. At the same time certain specifications are tightened as in the case of fall time and current gain. A new suggested specification has been recommended. Additional specifications on breakdown measurements have been arrived at in the light of knowledge gained in the fifth quarter in which catastrophic failures in switching were assigned to device geometry as well as fabrication. A new packaging process was evolved during the Contract which has the capability of making hermetically sealed devices. Groups leak tested by the radioactive gas analysis method have an 81.8% expectancy to a leak rate of less than 7×10^{-12} cc/sec, and a 100% expectancy to less than 2.7×10^{-12} cc/sec. The devices were acceptable with respect to the environmental conditions set forth in MIL-STD-202 Method 106. Methods of introducing aluminum into the emitter have been reported and are thoroughly understood. (Author) (See also PB 146 167)

Colorado U., Boulder.
TRANSISTOR PHASE DETECTOR FOR PHASE-LOCK STABILIZATION OF A 30,00Mc/sec KLYSTRON, by Robert W. Zimmerer. Rept. on Contract Nonr-1147(05). [1959] 4p. AD-219 926.
Order from LC mi$1.80, 1h$1.80 PB 148 140

A novel high frequency phase detector was developed to operate over an input range of 12 to 18 mcs. A pair of Philco 2N588 transistors and a hearing aid battery were used to form the error signal which was applied to the repeller to an E. M. I. R. 9518 reflex klystron. The phase detector floats at -2000 volts and is connected to the reference signals through high frequency broad band ferrite transformers. (Author)

INVESTIGATION OF NOISE GENERATION IN ELECTRICALLY TUNABLE MICROWAVE OSCILLATORS, by G. C. Dalman, P. R. McIsaac, and L. A. MacKenzie. Quarterly progress rept. no. 1, 23 June-23 Sep 59, on Contract DA 36-039-sc-84524. [1959] 40p. 7 refs. Research rept. EE 449; AD-229 345.
Order from LC mi$3.00, ph$6.30 PB 147 966

Research is concerned with gaining an understanding of the mechanism of the noise and spurious-output-signal generation in electrically tunable oscillators and with determining possible methods of improving the performance of these devices as local oscillators. A general expression for the signal-to-noise ratio of a backward-wave oscillator, operating as a local oscillator, is derived using linear travelling-wave tube theory. An approach to the large-signal theory of backward-wave oscillator operation is formulated. Methods of determining experimentally the large-signal properties of oscillators are being investigated. Some experimental results have been obtained and are being correlated with the theoretically expected results. (Author)

Cornell U. School of Electrical Engineering, Ithaca, N. Y.
INVESTIGATION OF NOISE GENERATION IN ELECTRICALLY TUNABLE MICROWAVE OSCILLATORS. Quarterly progress rept. no. 2, 23 Sep-23 Dec 59, on Contract DA 36-039-sc-84524. [1959] 52p. Research rept. EE-459; AD 234 840.
Order from LC mi$3.60, ph$9.30 PB 147 967

Measurements of the noise spectrum of a typical x-band backward-wave oscillator have been made and calculations of the signal-to-noise ratio begun. The normal mode analysis of transmission systems with current excitation is extended to cover the nonuniform current excitation of periodic circuits. The results are expressed in a form suitable for use with a nonlinear analysis of BWO's. A technique has been devised for determining experimentally the nonlinear characteristic associated with a self-excited oscillator. The method is essentially one of perturbation, which requires that small perturbing quantities be measured. To do this, a scheme for providing small changes in attenuation accurately has been developed. The general theory of perturbation is briefly outlined, and a specific case has been used for experimental

verification. The experimental data checks very well with theoretical predictions. (Author) (See also PB 147 966)

David Taylor Model Basin, Washington, D. C.
STRAIN-GAGE WATERPROOFING AND INSTRUMENTATION FOR FULL-SCALE SONAR DOME TESTS, by Mills Dean, III. Jan 59, 31p. 10 refs. Rept. 993.
Order from LC mi$3.00, ph$6.30 PB 138 273

Techniques used to install and waterproof a total of 168 strain gages are described. Also described is a unique method devised to accomodate the mass of connecting gage wires and to maintain the dummy gages in the same underwater environment as that of the active gages. Instrumentation circuits are given which were used for simultaneous recording of 61 channels of dynamic strain information on one sonar dome and 48 channels on the other.

Diamond Ordnance Fuze Labs., Washington, D. C.
FOUR-QUADRANT ANALOG VOLTAGE MULTIPLIER, by C. F. Ravilious. 16 May 60, 14p. 5 refs. TR-838.
Order from LC mi$2.40, ph$3.30 PB 146 812

A simple four-quadrant analog voltage multiplier is described. Four-quadrant multiplication is attained by means of a control winding, driven by one of the voltages to be multiplied, on the saturable reactor of a transistor-magnetic square-wave oscillator. The duty cycle of the oscillator is controlled by this input. A pair of transistor switches, operated from output windings on the oscillator core, apply the second voltage alternately in push-pull to two matched output resistors. The smoothed output taken across the two resistors in series is proportional to the product of the two input voltages. The operating range of the multiplier is ± 15 v output with a control winding input of ± 50 v and ± 25 v at the other input. Accuracy is within ± 2 percent of full scale. Power requirements are 12 ma at 12 v. (Author)

Electron Tube Research Lab., U. of Minnesota, Minneapolis.
STUDIES ON BASE NICKELS FOR OXIDE-COATED CATHODES, by W. G. Shepherd. Scientific rept. no. 7, 15 Oct 59-15 Jan 60, on Contract AF 19(604)3890. [1960] 82p. 3 refs. AFCRC-TN-60-194.
Order from LC mi$4.80, ph$13.80 PB 147 906

Problems associated with the preparation of Sr^{89}-tagged $(BaSr)CO_3$, prepared from $Sr(NO_3)_2$ powder irradiated in a high flux pile, are discussed. A technique is described for studying the long-pulse performance of oxide cathodes. Studies are reported of attempts to produce chemical activation by a controlled Ba atmosphere, in contrast to the normal chemical activation, in which an independent control of the alkaline earth metal vapor is not readily provided. Results are reported of the activation of oxide cathodes in the presence of active metal anodes. An experimental study of the deactivation of oxide cathodes by anode bombardment, and of subsequent reactivations is reported. Since all oxide cathodes are studied starting with a standard processing schedule, the effects of the processing schedule itself are reported. A technique for obtaining emission microscope patterns of an oxide cathode is described.

Electronic Systems Lab., Mass. Inst. of Tech., Cambridge.
APPLICATION OF SILICON CONTROLLED RECTIFIERS TO A D-C SERVOMOTOR, by Clarence Cantor. Rept. on Contract Nonr-1841(53). Aug 59, 60p. 10 refs. Rept. 8060-R-1; AD-232 187.
Order from LC mi$3.60, ph$9.30 PB 147 686

Results are reported of designing, building, and testing a servo system which incorporates silicon controlled rectifiers as the power supply for a d-c servomotor. A half-wave, bi-directional circuit, supplied by single phase, 400 c, is selected as the basic circuit for the rectifiers and dc motor. Firing angle control of the silicon controlled rectifiers is accomplished by a simple, fast response, pulse firing scheme utilizing uni junction transistors. The input control signals are a 400 c positional error signal from a control transformer and a dc stablizing signal consisting of velocity feedback through a high pass filter. The locked rotor torque characteristics of the rectifier circuit, for both carrier modulated and dc control, are derived with the zero-signal firing angle as a parameter. Measured speed torque characteristics show essentially identical, linear characteristics for both types of control signals at low speeds and small values of signal. The rectifier circuit frequency response is measured and calculated. Both agree fairly well and indicate very little rectifier circuit phase lag at servo frequencies up to 50 cps. All of this represents a very fast, well damped, accurate servo system. (Author)

[Electronic Systems Lab.] Mass. Inst. of Tech., Cambridge.
HIGH-POWER PULSE GENERATION USING SEMICONDUCTORS AND MAGNETIC CORES, by Edward M. Lassiter. Rept. on Contract AF 33(616)5489. Jan 59, 42p. 11 refs. Technical memo. 7848-TM-2; AD-213 521.
Order from LC mi$3.30, ph$7.80 PB 148 040

A magnetic pulse generator using a controlled rectifier in the charging circuit is capable of generating high-power pulses and is suitable as a radar modulator. In the discharge network the saturable inductors operators operate as high-power switching devices and together with the capacitors reduce the duration of the current pulse from a long duration at the charging circuit to a short duration at the output. An experimental circuit demonstrates the theory. This circuit operates at a repetion rate of 5 kc and produces an average power output of 300 watts. The peak power and pulse width at the output are approximately 40 kw and 1.5 μsec respectively. The efficiency of the experimental circuit, not considering the bias circuit, is approximately 70 percent. (Author)

[Electronic Systems Lab.] Mass. Inst. of Tech., Cambridge.
A TRANSISTOR-MAGNETIC PULSE GENERATOR FOR RADAR-MODULATOR APPLICATIONS, by Arthur Krinitz. Rept. on Contract AF 33(616)5489. Sep 58, 97p. 7 refs. Rept. 7848-R-1; AD-210 247.
Order from LC mi$5.40, ph$15.30 PB 148 041

An experimental model of the pulse generator is described containing three Type H-2 transistors and one Type H-10, a two-section discharge network and a two-section pulse-forming network. The generator supplies a peak power of 24 kw to a Type 2J42 magnetron at a repetition frequency of 1.7 kc. The pulse duration is 1 μs and the average power delivered is 40 w. A jitter of less than 0.1 μs is achieved through the use of a low-ripple d-c power supply. An efficiency of 50% is achieved and it is believed that a considerable improvement in efficiency could be had by relatively simple modification of the circuit. It type to provide many times the power output of the experimental generator. (Author)

Electronics Research Labs., Columbia U., New York.
RESEARCH ON ULTRASONIC DELAY LINES, by W. Konig. Technical rept. T-1/152 for 1 Oct 58-30 June 59 on Contract AF 30(602)1971. 1 July 59, 91p. 22 refs. CU-2-59-AF-1971-ERL; RADC-TN-59-226; AD-219 634.
Order from LC mi$5.40, ph$15.30 PB 147 029

The general theory of elastic wave propagation is briefly presented. Reflection and refraction of plane elastic waves at plane interfaces are studied with special emphasis on the solid-air interface. Solutions to the wave equation for solid plates are presented and the specific solutions of interest in the design of delay lines are studied in detail. Design information is obtained for the vertical dimension of transducers to minimize the excitation of spurious modes in plates, thus reducing ripples in the passband of a delay line. Expressions permitting the calculation of delay variation with frequency are included and plotted for typical delay line parameters. Various kinds of quartz transducers are discussed. An equivalent circuit for a thickness vibrating piezo-electric transducer is presented and the implications of the circuit investigated. Expressions are obtained for midband loss and frequency response. The possibility of double-peaking in the frequency response is discussed, and the condition necessary for its occurrence determined. This includes results for typical delay line parameters. Various techniques of bonding are discussed and the results of one technique are compared to the performance predicted by theory. (Author)

STUDY OF CROSSED-FIELD AMPLIFIERS. Quarterly status rept. no. 4, 15 Oct 58-14 Jan 59, on Contract DA 36-039-sc-74981. [1959] 58p. 16 refs. AD-220 572.
Order from LC mi$3.60, ph$9.30 PB 148 106

Forward-wave amplifier: Investigations are presented concerning the possibility of noise growth in the gun region. Backward-wave amplifier: Investigation of the large-signal behavior of a beam type cascade backward-wave magnetron amplifier indicated that the beam position becomes a less critical factor in the RF performance as saturation is approached. It was further observed that at large signals the output power for 2-circuit operation reaches a maximum at a higher value of magnetic field than for small signals. Comparison of experiment and theory: Quantitative agreement between experiment and Sedin's large signal analysis for crossed-field devices was obtained for several aspects of backward-wave magnetron interaction. The large signal theory of Feinstein and Kino qualitatively agrees with observed experimental behavior for the power output-power input characteristic of the tube. New crossed-field tube design: The design was completed of a new experimental single-circuit M-type tube. Tube gain was calculated using Sedin's theory.

STUDY OF CROSSED-FIELD AMPLIFIERS, by T. Van Duzer, J. R. Whinnery, and J. R. Anderson. Quarterly status rept. no. 6 and 7, 15 Jan-14 July 59, on Contract DA 36-039-sc-74981. [1959] 62p. 18 refs. AD-230 792.
Order from LC mi$3.90, ph$10.80 PB 148 107

In noise studies, a retarding field diode has been designed for obtaining a measure of stream velocity distribution at several planes near the cathode. In large signal studies, the interdigital circuit velocity has been found and impedance is being obtained. Measurements were made on a single-anode model of the multianode velocity analyser designed for measurements on a crossed-field beam in the gun region. Preliminary analysis of the crossed-field potential minimum, shows that the critical parameters could be so modified by the magnetic field that instabilities would occur. A cathode which produces a transverse field across its surface to compensate the magnetic forces in the potential minimum has been conceived. In the large signal studies, the electron gun was found to produce a well-defined, smooth beam which could be focused to the collector with negligible beam spread for d-c operation. The dispersion curves for the first spatial harmonic of the inter-digital circuit have been checked under hot test conditions and the results agree well with previous cold test measurements. Both forward- and backward-wave interaction over a wide frequency band has been obtained. Exploratory measurements show a power gain of at least 17 db for backward-wave amplification at small signals. (Author)

STUDY OF CROSSED-FIELD AMPLIFIERS, by J. R. Whinnery, C. K. Birdsall and others. Quarterly status rept. no. 8, 15 July-14 Oct 59, on Contract DA 36-039-sc-74981. [1959] 34p. 3 refs. AD-233 691.
Order from LC mi$3.00, ph$6.30 PB 148 108

A cathode which produces a transverse electric field across the surface in order to compensate the transverse magnetic forces in the region of the potential

minimum has been tested. The purpose of compensating the magnetic forces was to make the crossed-field potential minimum more like the ordinary type. The noise figure of the tube, operating as a N-type backward-wave amplifier, has been measured and is found to be of the same magnitude as for O-type traveling-wave tubes when attention was first directed toward their noise problem (25-35db). Also, signal-to-noise ratios were found to be very good (40 - 65 db). A range of d-c operating conditions has been determined over which a thin, rectilinear electron stream can be maintained. Some large-signal backward-wave amplifier experimental data have been obtained and are compared with Sedin's theory. Electronic efficiencies of 30% have been observed for backward-wave amplification, with the efficiency of conversion of available d-c beam energy to r-f wave energy as high as 70%. METHOD OF TESTING THE DIELECTRIC BREAKDOWN VOLTAGE AND DIELECTRIC STRENGTH OF MINIATURE SPECIMENS, by Andrew R. Blanck and Benjamin T. Holman. May 60, 10p. 4 refs. Technical notes no. 44.
Order from LC mi$1.80, ph$1.80 PB 145 926

Tubular shrouds were investigated as a means of preventing surface flashover in the testing of miniature test specimens for dielectric strength. The specimens used were cut from small-diameter polytetrafluoroethylene (TFE) rod. The technique is applicable whenever small specimens must be tested for breakdown voltage or dielectric strength and where flashover is found to occur. Tubular shrouds do not cause electric field distortion such as generally occurs with well-type specimens. (Author)

HIGH-TEMPERATURE INSULATION FOR WIRE, by J. N. Harris and J. D. Walton, Jr. Rept. for Mar 59-Mar 60 on Electrical and Electronic Materials, Contract AF 33(616)3944. Mar 60, 40p. 2 refs. WADC Technical rept. 58-13, Pt. III.
Order from OTS $1.00 PB 161 788

Normal anodizing of commercial aluminum-clad copper wire did not result in complete anodization of the aluminum due to its thickness. Advantage was taken of the solvent action of sulfuric acid to remove a portion of the excess aluminum, however, complete anodization was not possible due to uneven removal of the aluminum causing exposure of the copper. Best results obtained were an anodized coating thickness of 0.8 to 1.0 mils and an unanodized aluminum layer 0.3 mil in thickness. The use of electrophoretic deposition of colloidal silica for sealing the pores of anodized coatings was not successful. Better results were obtained by providing colloidal silica sealing by gelling hydrolyzed ethyl silicate solutions on phosphoric acid anodized wire. This resulted in a wire insulation with an average dielectric constant of 2.89 and a dissipation factor of 1.87 per cent. The best insulation system was provided by sealing sulfuric acid--magnesium chloride anodized wire with a frit-resin coating. This wire was capable of operating at 800°F. (Author)

RADAR SET AN/TPS-25(XE-2) by R. A. Best and J. G. Simes. Final rept. for June 57-May 59 on Contract DA 36-039-sc-66411. [1959] 134p. Rept. 5115, includes rept. 9968-2; AD-228 080.
Order from LC mi$6.90, ph$21.30 PB 147 921

The Radar Set AN/TPS-25(XE-2) is a lightweight, highly-transportable battlefield-surveillance radar capable of detecting and locating a moving target or targets in the presence of ground clutter. The AN/TPS-25(XE-2), based on the non-coherent pulse doppler principle, can be used either inside or outside of its shelter. It is designed to search a given area for moving targets, and to aurally detect and locate them, especially at night or during periods of poor visibility. Equipment of this type is used for battle area surveillance by the latest Army ground service units; its accuracy and presentation are especially useful for artillery fire control. The acceptance tests were performed on two radar sets. They included all those environmental tests listed in the equipment specification. Changes determined by preliminary results of these tests were incorporated in all equipments and final test results indicated that the equipment met all of the acceptance test requirements. Additional tests, requested by the government representative were also described.

Hogan Labs., Inc., New York.
RESEARCH AND DEVELOPMENT OF AN OPTICAL TO ELECTRICAL SCANNING TRANSDUCER. Final technical rept. for 1 May 58-30 Apr 59 on Contract DA 44-009-eng-3485. 1 May 59, 79p. Rept. no. 1251-4; AD-218 992.
Order from LC mi$4.50, ph$12.30 PB 147 461

This report describes a high speed electro-mechanical scanning device to replace the manual tracing table in a Kelsh stereoplotter. The unit is capable of scanning the stereo model projected and formed by a Kelsh stereoplotter and will be suitable for use with automatic stereo mapping equipment.

Hughes Aircraft Labs., Culver City, Calif.
STUDY OF ATOMIC AND MOLECULAR RESONANCES FOR MICROWAVE GENERATION AND AMPLIFICATION, by G. Birnbaum, D. Devor and others. Final rept. for 15 Dec 57-15 Sep 59 on Contract DA 36-039-sc-74967. [1959] 57p. 29 refs.
Order from LC mi$3.60, ph$9.30 PB 147 426

The experimental performance of a ruby maser operating from 4° to 195°K is presented and discussed analytically. A 4-pound, liquid-nitrogen-cooled ruby maser amplifier was constructed with a 14-Mc gain-bandwidth product. The ordered operator theory of linear dissipative quantum circuits is extended to treat multi-port elements. Spin-lattice relaxation models are discussed. The feasibility of chemically tuning maser materials is demonstrated. Paramagnetic chars are assessed. The level splittings and transition probabilities for the ground state of rutile are given for various fields and orientations. (Author) (See also PB 147 425)

Hunt Corp., Carlisle, Pa.
DESIGN AND DEVELOPMENT OF IMPROVED METHODS OF MOUNTING AND ATTACHING SUPPORT WIRES TO LOW FREQUENCY RESONATORS, by R. E. Calaman. Final rept., 1 June 56-15 Apr 59, on Contract DA 36-039-sc-72791. [1959] 22p. AD-233 824.
Order from LC mi$2.70, ph$4.80 PB 147 976

Design and development efforts are summarized for mounting and attaching support wires to LF (below 500 kc) resonators. Studies indicated that satisfactory materials are limited for use in fabricating HF face-shear crystals for high-temperature (200°C) application. Adhesives and cements were unsatisfactory because of their instability and high damping characteristics. Lead attachments of quartz or glass filaments failed because of unmatched coefficients of expansion of the quartz plate, the filament, and the bonding glass solder. Plastic filaments were unsatisfactory for the same reasons, and because of distortion of their physical dimensions under heat and stress. Attachment of lead wires by cement caused damping and most cements could not be made electrically conductive. Evaporated films on the cements also failed. The use of foundation holes in their quartz gave greater strength but did not overcome the difficulties. Hard solders were used with good results but were not acceptable to the government. Nonbonded mountings were mechanically unsound. Pressure weld of metal leads to fired spots on the crystal faces by the thermo-weld technique provided the best bonds. Round configurations of DT cuts showed lower resistance than square units of similar construction and frequency. (See also PB 142 646)

Johns Hopkins U., Baltimore, Md.
THE TRANSIENT BEHAVIOR OF NONLINEAR SYSTEMS, by Francis H. Clauser. Rept. on Contract AF 49(638)496. Apr 60, 57p. 1 ref. AFOSR-TN-60-397.
Order from LC mi$3.60, ph$9.30 PB 147 520

It is shown that the classical perturbation procedure for treating nonlinear systems leads to solutions expressed as Fourier-like series with slowly varying coefficients. These slowly varying coefficients contain the information about the long term behavior of the system. Inconsistently, the classical perturbation procedure expresses these coefficients as power series, a mode of expression which has notoriously poor long term validity. An operational procedure is presented for treating oscillations having slowly variable amplitudes and frequencies.

Linfield Research Inst., McMinnville, Oreg.
THE APPLICATION OF FIELD EMISSION TO MILLIMETER-WAVE OSCILLATORS AND AMPLIFIERS, by F. M. Charbonnier, E. G. Brock and others. Final rept. 15 June 56-15 Aug 58, on Contract DA 36-039-sc-72377. [1958] 103p. 16 refs. AD-218 113.
Order from LC mi$5.70, ph$16.80 PB 147 987

Some distinctive properties of the field cathode and their implications in microwave devices are briefly discussed in the Introduction. The theoretical and experimental work performed on two field emission devices, a monotron oscillator and a frequency multiplier, is reported. In the latter case the experimental data obtained were used for a quantitative comparison with the theory. A satisfactory agreement was found, which confirms the high harmonic content of the field emission beam under suitable conditions, and suggests further work towards the development of high peak power field emission mixers and harmonic generators. The work on cathode and gun development is reported. Miniaturized high transmission field emission guns were developed under the present contract, which may be used in microwave and electron optical devices. A brief discussion is given of the high vacuum system and the microwave equipment built for the present contract, including test bench components at 70 kmc. (Author)

Lockheed Aircraft Corp., Sunnyvale, Calif.
PIEZORESISTIVITY IN SEMICONDUCTORS FOR TRANSDUCER APPLICATIONS, by L. E. Hollander, Jr., G. L. Vick and others. Technical rept. 1 June 59, 35p. 17 refs. LMSD-49736; AD-217 163.
Order from LC mi$3.00, ph$6.30 PB 147 675

Piezoresistivity, the result of strain on resistivity, offers a tool for analyzing the conduction mechanism in semiconductors and also offers potential transducer applications. A discussion of this effect and an analysis of the fourth rank piezoresistive tensor for 2 crystal symmetries are presented. The magnitude of the effect in semiconductors is tabulated, including 2 materials, TiO_2 and PbTe, which the authors have determined to be of considerable interest. The design of devices based on piezoresistivity is discussed and illustrated by working models. (Author)

Lockheed Aircraft Corp., Sunnyvale, Calif.
PRELIMINARY THEORETICAL AND EXPERIMENTAL STUDIES OF MICROWAVE MASER AMPLIFIERS, by J. Rowley and W. Taylor. Technical memo. 10 May 59, 32p. 7 refs. LMSD-49712.
Order from LC mi$3.00, ph$6.30 B 147 674

This report describes the initial phase, summarizing the experimental and theoretical studies, of an investigation of microwave amplification using stimulated electromagnetic radiation (MASER) between atomic energy levels of a paramagnetic material. Fundamental considerations for cavity and traveling-wave Maser amplifiers are discussed. Experimental data are reported on the microwave circuitry designed for the system. These data show good agreement with the design data. The data for the meanderline show good agreement with the theoretical predictions. From the data obtained, it appears that the microwave elements will satisfy the requirements for a working Maser. (Author)

Lockheed Aircraft Corp., Sunnyvale, Calif.
STATISTICAL DESIGN AND EVALUATION OF DEMODULATION SYSTEMS FOR ANGLE MODULATED SINUSOIDS, by J. J. Spilker, Jr. Technical rept. Apr 59, 83p. 21 refs. LMSD-48496; AD-216 592.
Order from LC mi$4.80, ph$13.80 PB 147 673

The optimum realizable demodulation system is derived for angle modulated sinusoids in the presence of additive noise. Optimum here refers to that estimate which maximizes the a posteriori probability of the message, given that a set of data was received, this message is most likely to have been transmitted. The optimum demodulation system is shown to have the same nonlinearities as a phase lock loop, but it has special linear filtering. A statistical comparison of the optimum system with a demodulation system using a discriminator shows the optimum system to provide significant improvement in the threshold signal-to-noise ratio. Another important set of results obtained in this paper is the derivation of the optimum realizable demodulation systems for signals where a modulated or sampled form of the message is used to angle modulate the carrier. (Author)

Lockheed Aircraft Corp., Sunnyvale, Calif.
THEORY OF FERRITE-COUPLED TRANSMISSION LINE NETWORKS, by Philip S. Carter, Jr. Technical note. 27 Feb 59, 28p. 9 refs. LMSD-48479; AD-215 979.
Order from LC mi$2.70, ph$4.80 PB 147 672

An analysis is presented of ferrite-coupled TEM-mode transmission lines. Both the reciprocal and nonreciprocal transmission properties of a two-line or two-mode system have been analyzed for the case where the axis of d-c magnetization is along the direction of transmission. The analysis was applied to the case of a transmission system which consists of two conductors plus a shield and it has been shown that under certain conditions the current will be coupled back and forth between the two conductors in a nonreciprocal fashion, i.e., gyrator action will be obtained. Formulas were derived from which the coupling coefficients due to the ferrite can be calculated for the case where the ferrite rod is located in the plane of symmetry between the two conductors. Finally, a proposed arrangement of ferrite coupled lines to form a transmission-line circulator is considered and its properties, i.e., matching requirements and isolation, are analyzed. (Author)

Mallory, P. R., and Co., Inc., Indianapolis, Ind.
SERVICE TEST MODELS OF POWER SUPPLY PP-1835 ( )/GRC AC POWER SUPPLY FOR STANDARDIZED SERIES OF FM RADIO SETS, by B. L. Borman. Final rept. 15 Apr 58-20 July 59, on Contract DA 36-039-sc-66435. [1959] 60p. AD-232 344.
Order from LC mi$3.60, ph$9.30 PB 148 104

The feasibility of producing AC power supplies for units of the AN/GRC-3 through AN/GRC-8 as well as AN/GRC-9Y in a PP-327F/GRC-9Y case was demonstrated. The power supply can operate Set 1(RT-66, 67, or 68/GRC); Set 2 (RT-70/GRC); Audio Amplifier (AM-65/GRC), or the Auxiliary Receiver (R-108, 109, or 110/GRC) singly or in possible unit combinations. Operation of the power supply without load is not detrimental. The operation of one or several units from a single supply required considerable voltage regulation to compensate for varying voltage drops resulting from variation in output currents. This is considerably different from previous supplies like the PP-327A which operated only into constant loads. By utilizing the latest power rectification and voltage control methods, a considerable reduction in internal dissipation of the supply was achieved. The silicon rectifiers and magnetic amplifiers used in this supply are not subject to aging and will operate at a higher temperature compared to the selenium rectifiers and series pass regulator tubes used in previous power supplies of this type. The 5 service test models for this contract satisfactorily passed all tests. (Author)

Massachusetts Inst. of Tech., Cambridge.
TRANSISTORIZED TWO-SEGMENT COMMUTATOR FOR A DIRECT-CURRENT MACHINE, by D. M. P. Eisenlohr. Rept. on Contract AF 33(616)3984. Feb 60, 61p. 31 refs. WADC Technical rept. 59-683.
Order from OTS $1.75 PB 161 790

This report covers the development of a fully electronic two-segment commutator, which was then experimentally used to demonstrate generator and motor operation of a d-c machine with a single winding armature. A short review is given of the brushless machines already existing and their similarities to synchronous machines. Their limitations are pointed out and a type of static bilateral inverter (commutator) is suggested, which would avoid these limitations. The main part of the report describes the development of a two-segment commutator using transistors for the commutator switches as well as for the control circuitry. The complete circuit consists of a position signal generator, mounted on the shaft of the machine, where the Hall effect is used for obtaining a signal indicative of rotor position without the use of mechanical contacts. This signal is converted into pulses by transistorized Schmitt triggers. These trigger pulses drive transistor control flip-flops, whose function is to turn on and off the power transistors responsible for commutating the armature. This inverter was shown to operate analogously to a mechanical two-segment commutator and some tests of its operation are reported. (Author) (See also PB 161 721)

Melabs, Inc., Palo Alto, Calif.
RESEARCH AND DEVELOPMENT OF A SOLID STATE PARAMAGNETIC MASER, by Roy W. Roberts. Quarterly progress rept. no. 6 (Scientific rept. no. 6) 10 Sep-9 Dec 59, on Contract AF 19(604)4071. 9 Jan 60, 34p. 2 refs. AFCRC-TN-60-140; AD-233 578.
Order from LC mi$3.00, ph$6.30 PB 146 323

A theoretical analysis of the ungrounded comb structure was extended. Methods of controlling the slowing factor were investigated and it was determined that considerable control could be exercised by changing the placement of the ruby slab. A theoretical analysis of a cross-relaxation effect which is particularly helpful at these frequencies was carried out. This is a multiple transition type effect and as such is very sensitive to paramagnetic ion concentration. (Author)

Microwave Associates, Inc., Burlington, Mass.
ENGINEERING REFINEMENT PROGRAM FOR S BAND TR TUBE EST-25( ), by Emanuel L. Horn. Final rept. 21 Apr 58-30 Oct 59, on Contract DA 36-039-sc-75039. [1959] 98p. AD-233 745.
Order from LC mi$5.40, ph$15.30 PB 147 969

The technique for fabricating the encapsulated windows appears to be applicable for production since a rate of six units per hour can be obtained with one set of equipment. The preliminary environmental tests seem to indicate that the window is rugged and can withstand severe mechanical and temperature shock. Additional environmental tests on the encapsulated window also failed to produce window failure. The windows were subjected to a non-uniform temperature shock test which should simulate the effect of a gas discharge on the window properties. The use of the improved ignitor assembly in a TR tube should result in a stable ignitor performance. (Author)

Microwave Associates, Inc., Burlington, Mass.
HIGH POWER C-BAND BEACON MAGNETRON RESEARCH AND DEVELOPMENT PROGRAM, by W. V. Hattery. Quarterly progress rept. no. 1, 1 July-30 Sep 59, on Contract DA 36-039-sc-78934. [1959] 29p. AD-230 919.
Order from LC mi$2.70, ph$4.80 PB 147 985

Research concerns the development of an adjustable frequency high power C-band magnetron. The magnetron shall be tunable through the range 5625 to 5675 Mc/s with a peak power output of 40 Kw. It shall operate with a 10 Kv maximum anode pulse with a ten microsecond duration. The delivery of three final design tubes and associated manufacturing drawings is required as partial fulfillment of the contract. A statement of the technical requirements and a description of the electrical and mechanical designs employed to meet these requirements are given. A cross section view of the proposed magnetron and an outline drawing, showing the general configuration of the proposed MA220 magnetron, are presented. Results of preliminary tests are given. The more difficult of the anticipated problems and the plans for their solution are discussed.

Microwave Associates, Inc., Burlington, Mass.
HIGH POWER C-BAND BEACON MAGNETRON RESEARCH AND DEVELOPMENT PROGRAM, by D. Hobbs. Quarterly progress rept. no. 2, 1 Oct-31 Dec 59, on Contract DA 36-039-sc-78934. [1959] 33p.
Order from LC mi$3.00, ph$6.30 PB 147 986

Results of tests performed on various subassemblies of the tube are described and various measured parameters compared with calculated values. A discussion of the results obtained on the operation of the first two tubes is given. Further discussion is given on work done to solve cathode problems due to the long-pulse operation requirement. (Author) (See also PB 147 985)

Microwave Associates, Inc., Burlington, Mass.
HIGH REPETITION RATE BROADBAND DUPLEXER, by Emanuel L. Horn. Quarterly progress rept. no. 4, 15 May-15 Aug 59, on Contract DA 36-039-sc-78165. [1959] 38p.
Order from LC mi$3.00, ph$6.30 PB 147 982

Measurements of arc loss and recovery time as a function of argon gas pressure were continued using an encapsulated input window containing various densities of quartz wool. The data shows that at practical operating pressures with peak incident power of 6 kw and 16 μs pulse width, an encapsulated window with no quartz wool has a minimum recovery time of 40 μs and a corresponding arc loss of 3.3%. Windows with medium density and heavy density quartz wool have minimum recovery times of 20 μs and 8 μs respectively and corresponding arc losses of 3.7% and 5.5%. Experimental windows with dumbell shaped irises and argon gas fills yielded minimum recovery times of 65 μs and 80 μs with corresponding arc losses of 2.35% and 5.5%. The modulator for the X-700 klystron has been received and installed. (Author) (See also PB 146 494)

Microwave Engineering Labs., Palo Alto, Calif.
INVESTIGATION OF MICROWAVE NON-LINEAR EFFECTS UTILIZING FERROMAGNETIC MATERIALS, by Roy W. Roberts. Quarterly progress rept. no. 11, 1 Nov 59-31 Jan 60, on Contract DA 36-039-sc-73278. [1960] 48p. 6 refs.
Order from LC mi$3.30, ph$7.80 PB 147 994

An expression is developed showing the volume dependence of the generated second harmonic power. This expression has been verified qualitatively. In general, best conversion is obtained from large samples with a high moment and narrow linewidth. It is relatively independent of sample shape provided no dimension is longer than a free space wavelength. An analysis of dielectric rod resonances has been applied to low-field ferrite rod resonances in an attempt to gain more quantitative information regarding the ferrite amplifier signal modes. A study of the theory has led to the concept of a new type of ferromagnetic amplifier. Considerable success has been achieved in growing large single crystals. In one run a crystal weighing nine-grams and measuring 2.3 cm in length was obtained. (Author) (See also PB 146 491)

Microwave Lab., Stanford U., Calif.
BASIC MICROWAVE RESEARCH, by M. Chodorow. Scientific rept. no. 19, 1 Oct-31 Dec 59, on Contract AF 19(604)1930. Feb 60, 30p. M. L. rept. no. 694; AFCRC TN-60-180.
Order from LC mi$2.70, ph$4.80 PB 148 028

Microwave Tube Studies: Analysis of the behavior of velocity modulated electron beams in long gaps has been extended to the calculation of the beam loading admittance. A project has been initiated to obtain highly convergent space-charge limited guns for certain crossed-field devices. Plasma Physics Studies: Numerical solutions have been computed for the determinantal equation for the interaction of a modulated electron beam with a plasma medium in an infinite magnetic field. A re-examination of the theory of traveling-wave type parametric amplification in a plasma column has given insight on the marginal performance of the tubes used. Experiments attempting to excite low-velocity plasma sound waves are described. A new electrode configuration for imposing the rf field on the plasma confirmed earlier conclusions that the confinement phenomena is not a radiation pressure effect but more likely a sheath effect. A new project is concerned with analysis of

nonlinear effects by Hamiltonian methods and the investigation of a possible experiment to verify the concept of Landau damping. Further knowledge has been gained about the production of cesium plasmas.
Ferrite Studies: The objective of a new project is to investigate nonlinear resonance phenomena in small ferrite ellipsoids. Theory is being compared with experiments on small ferrite samples to gain insight into the essential factors necessary for efficient frequency multiplication using ferrites. (See also PB 145 968)

Microwave Research Inst., Polytechnic Inst. of Brooklyn, N. Y.
LINEAR PASSIVE NETWORKS INVESTIGATION, by D. C. Youla and H. J. Carlin. Final rept. on Contract AF 30(602)1709. 15 Dec 59, 12p. Final rept. R-793-59; PIB-721; RADC-TR-59-253; AD-233 009.
Order from LC mi$2.40, ph$3.30 PB 146 124

This report is a presentation of the research in network techniques for lumped, distributed, active, and time-varying systems that has been carried out under this contract. The report contains the results on the physical realizability and general representation of linear, passive n-ports. Methods suitable for the broadband equalization of distributed parameter one-ports and lumped two-ports have been developed. The conclusions drawn from a study of the analytic properties of distributed-lumped networks are reported. The results of a theoretical and experimental program concerned with networks containing parametric elements are included. In general this program has extended many of the concepts of low frequency network theory to the solution of theoretical and practical design problems at microwave frequencies. (Author)

QUARTERLY PROGRESS REPORT 15 APRIL 1957 THROUGH 14 JULY 1957 TO JOINT SERVICES TECHNICAL ADVISORY COMMITTEE, by Ernst Weber. Rept. on Contract AF 18(600)1505. Sep 57, 106p. 48 refs. Rept. R-452.8-57.
Order from LC mi$5.70, ph$16.80 PB 137 569

The research effort at the Microwave Research Institute is motivated by a desire to fulfill an academic responsibility by providing a means for both faculty and graduate student body to participate in a significant and fundamental research program responsive to technological and national interests. Accordingly the program covers a broad spectrum ranging from basic theoretical programs in physics, mathematics, and engineering to experimental programs involving basic measurements and the development of devices and materials. Although the specific structure of this program is continually being refined, it appears desirable to summarize from time to time the individual programs of the various groups and sections that constitute the Microwave Research Institute.

Motorola, Inc., Riverside, Calif.
PERSONNEL NAVIGATION SYSTEM STUDY, by Hugh J. Galbraith and Leslie D. Snyder. Final rept. for 15 Apr 58-15 Apr 59 on Contract DA 36-039-sc-75037. May 59, 497p. 787 refs. Rept. no. RLF-3838-1; AD-227 998.
Order from LC mi$11.10, ph$75.60 PB 146 981

A detailed design proposal for a lightweight manpack personnel navigation equipment is presented. The Appendixes support the proposed equipment design and constitute a final report on all phases of the theoretical and experimental investigations of applicable motional sensors, directional references and navigation techniques. The equipment embodies an ultrasonic Doppler velocity sensor, a magnetic directional reference and an operational-digital navigation computer and indicator. The unique features of the proposed design include a novel frequency tracking scheme, an all-electronic method of reading out magnetic heading and pulse-train digital computing techniques. The feasibility of magnetic velocity determination and algebraic-inertial navigation techniques were also investigated. The experimental effort included the fabrication and testing of ultrasonic Doppler transducers, simulators, and associated circuitry, magnetic heading reference circuitry, and magnetic field measuring devices. The human factors aspect of a personnel navigator were investigated and an experiment was conducted to obtain measurements of linear and angular accelerations that may be expected of a man carrying the navigation equipment. REDUCTION OF THE HYDROGEN OVERVOLTAGE OF NICKEL ELECTRODES WITH PALLADIUM, by J. C. White and S. Schuldiner. Final rept. 6 May 60, 8p. 2 refs. NRL rept. 5454.
Order from LC mi$1.80, ph$1.80 PB 144 637

The hydrogen overvoltage of nickel electrodes in 21% KOH solutions can be lowered by the addition of palladium to the electrodes. This can be done either by plating Pd black on the surface or by alloying nickel with a small amount of palladium. In the latter case it was shown that under anodic and cathodic cycling, palladium concentrated on the surface of the electrode. The possible use of these modified nickel electrodes in the electrolytic oxygen generator developed at NRL is suggested. (Author)

SEA-WATER BATTERIES, by W. H. Martin (Bell Telephone Labs., Inc.). Final rept. on Contract OEMsr-1069. 30 Nov 45, declassified 1 Feb 60. 535p. Section no. 6.1-sr-1069-2128; OSRD no. 6420; AD-128 639.
Order from LC mi$11.10, ph$81.90 PB 146 264

Part One outlines basic research and the general principles of electrochemical and mechanical design of sea-water batteries. Part Two describes specific designs of sea-water batteries, their performance

characteristics, and the testing program. Part Three covers battery building and related activities such as the development of tools, facilities and methods for battery production, materials procurement, and engineering of the transition to manufacture. Nine appendices are a selection of technical papers that deal with electrochemical and hydraulic considerations. Also included are a list of other pertinent memoranda and letters, and a bibliography of technical memoranda, specifications, and patent applications. The sea-water batteries developed under this project, employ silver chloride as the active cathode material and magnesium alloy as the anode. Sea water is admitted to the battery by breaking the seals at the time the battery is put in use.

400 Mc/Sec CUTOFF NOTCH ANTENNA AEROBEE HI, by Dennis G. Henry. Scientific rept. no. 4, on Contract AF 19(604)2188. 2 Mar 60, 21p. AFCRC-TN-60-295.
Order from LC mi$2.70, ph$4.80 PB 147 898

This report gives the characteristics of the 400 Mc range Command Control Notch Antenna for the AEROBEE HI. This antenna is to be modified from the 54.5 Mc notch antenna. A detailed study of the radiation pattern was conducted to see what effect the modification had. A bandwidth check was also made. The physical dimensions of the modified antenna are given and compared to the original 54.5 Mc notch. These changes are shown in the included photographs. (Author)

ELECTRON TUBE MATERIALS, GASES, AND GETTERS, by J. C. Turnbull and G. P. Kirkpatrick. Quarterly progress rept. no. 4, 15 July-15 Oct 59, on Contract DA 36-039-sc-78226. 15 Nov 59, 66p. 7 refs. AD-232 384.
Order from LC mi$3.90, ph$10.80 PB 147 991

Outgassing data were obtained on Ni, cold-rolled steel, Ni-plated steel, gas-carbonized Ni-coated steel, Al-clad steel, Mo, and Kovar by the use of RF induction heating (AD-227 616). The metal sample was a strip 0.005 in. thick, formed into a cylinder 1 in. in diameter by 3/8 in. high. The cylinder was mounted on a tungsten lead stem and had a chromel-alumel thermocouple welded to the inside. The sample was sealed inside a hard glass bulb, exhausted, and baked at 400°C for 1 hour. The gas evolution obtained on heating the sample by RF induction was measured with a mass spectrometer. Quantities of the gas components (H, CO + N, CO_2 and O) for Ni, Mo, Ni-plated steel, and Kovar were similar in magnitude. H ranged from 0.5 to 2 1-μ/g, CO + N from 10 to 30 1-μ/g, and CO_2 from 2 to 9 1-μ/g. Al-clad steel showed higher levels of H, with other gases in the same range. Cold-rolled steel showed similar levels of H and CO_2, with much higher levels of CO + N. Carbonized Ni-coated steel showed high levels of all gases, with a small evolution of O at the higher temperatures. Lower-temperature (400°C) outgassing experiments for 40 hr were performed on Ni, cold-rolled steel, Al-clad steel, gas-carbonized Ni-coated steel, Ta, Cu, and mica. Little relationship was found by comparing gases evolved on heating in 20-min steps to 1000°C with gases determined by vacuum fusion analysis. The predominant gas on outgassing at 400°C was H. (See also PB 145 802)

Ramo-Wooldridge, Div., Canoga Park, Calif.
STUDY OF FAULT LOCATION AND PREDICTION TECHNIQUES LEADING TO PLANS FOR AUTOMATIC AND DYNAMIC TESTING OF MILITARY GROUND EQUIPMENT, PARTS I AND II. Final rept. on Contract AF 30(602)1997. 15 Feb 60, 192p. 3 refs. C62-9U37; RADC-TR-59-248A. AD-233 011.
Order from LC mi$8.70, ph$30.30 PB 146 109

The study has been oriented to resolving the problems of automatic monitoring and testing of the equipments of a P-site; a primary objective has been to arrive at plans for a test-system which would be applicable not only to a P-site but to a variety of operational and maintenance installations, both present and prospective, the only important condition being that the equipments or systems to be tested are basically electrical or electronic in nature. Part I. Theory, Methods, and Design Principles. Part II. Test-System Plans.

SYNTHESIS OF A TYPE OF PHASE CORRECTOR FOR MAGNETIC TAPE RECORDERS, by Richard A. Wainwright. Technical rept. no. 1 on Contract DA 49-186-502-ORD-832. Apr 60, 100p. 27 refs.
Order from LC mi$5.40, ph$15.30 PB 147 637

This paper covers several closely related areas concerning approximately linear phase, complex wave handling systems, with particular emphasis on phase linearization of magnetic tape recorders. The first

subject concerns the phase and amplitude requirements of a system required to handle complex waveforms in order to have an output waveform that for the most part resembles the signal applied to the input terminals. The second section covers complex waveform makeup, their Fourier expressions where convenient, spectrum plots of certain types of complex waveforms, and shows pictorially the effects of amplitude and phase distortions of a few common waveforms, viz., square waves, and triangular type waveforms. The third section covers the general theory of All-Pass Networks from the point of view of the poles and zeros of the transfer function, and includes a discussion of mismatch effects. Section four describes the system used to verify the phase correcting scheme described in section three. Section five gives a rather general coverage of tape noises and includes a curve which shows the approximate spectrum of tape noise vs. tape-to-head spacing. The conclusion lists several applications of the networks described that are not included in the main body of the report.

MULTIPLE ANGLE DIVERSITY DESIGN CONSIDERATIONS, by W. R. Richard and M. H. Bickelhaupt. Apr 60, 39p. 21 refs. RADC-TN-60-22.
Order from LC mi$3.00, ph$6.30 PB 147 753

Tropospheric scatter communication will become a very important means of communication in the foreseeable future. In order to obtain longer ranges, tropospheric scatter systems have been designed for use at lower and lower frequencies. At the present time our longest range tropospheric scatter equipments operate in the region of 400 megacycles; but there are regions in the world where this frequency band cannot be made available. Accordingly, a new principle, multiple-angle diversity, has been applied, which allows somewhat greater ranges or more reliability at higher frequencies - even into the microwave region. This paper discusses the multiple-angle diversity scatter system and its design considerations. Particular attention is given to the beam patterns employed and to accordant modifications of antenna and antenna-feeder requirements. (Author)

THE NATURE AND BEHAVIOR OF REDUNDANCY NETWORKS AND FUNCTIONS, by Fred Moskowitz. May 60, 196p. 33 refs. RADC TR-60-4.
Order from LC mi$8.70, ph$30.30 PB 148 022

This report presents various properties and characteristics of probabilistic redundancy networks and functions which can be used to represent reliability relationships in complex equipment containing redundant elements; large scale systems containing a multiplicity of alternative subsystems or telecommunication nets containing possibilities of alternative routing. By making the simplifying assumptions that all elements of a system have independent failure statistics and that the reliability of an element remains unchanged when it is incorporated into a system, a simple algebra can be used by means of which the analysis of such redundancy networks becomes possible. (Author)

RADAR DATA TRANSFER SYSTEM AN/TRQ-10(XW-1)/GR, by G. K. Bennison and M. M. McCormick. Apr 60, 116p. RADC TR-60-38.
Order from LC mi$6.00, ph$18.30 PB 147 760

This system operates in the 7135- to 7985-mc frequency range and relays radar search and surveillance data by a narrow microwave beam, virtually eliminating interception by an enemy. The equipment is compact, easily transported by land or air, and readily sited. It consists of a transmitting unit and a receiving unit which are rack-mounted in portable electrical equipment shelters. The system range (15 to 30 miles under line-of-sight conditions) can be extended by the use of repeater stations and is a great improvement over the 10,000-foot limitation of cable-link systems. Azimuth data, three video signals range marks and trigger pulses are combined and transmitted on four f-m microwave carriers. The system was field tested using an r-f path established between Griffiss AFB and Verona, N. Y. Receiver sensitivity, transmitter power output, cross-talk measurement, azimuth tracking accuracy, power regulation, comparison of local and remote plan position indicator (PPI) presentations, and antenna radiation pattern, system delay, and VSWR measurements were among the tests performed. This new microwave system constitutes an effective and very reliable link for transmitting tactical radar data to distant points. (Author)

DEVELOPMENT OF A LOW-FREQUENCY TRAVELING-WAVE-TUBE CHAIN. Final progress rept. 1 Dec 56-28 Feb 59, on Contract DA 36-039-sc-73116. Oct 59, 159p. 13 refs. Sperry rept. no. NA-8230-8157.
Order from LC mi$7.50, ph$24.30 PB 147 971

Ten STP-106 prototypes were constructed. A demountable tube was assembled, containing the helix interaction structure, to develop a satisfactory low-noise gun. The construction of this tube provided for the expeditious interchange of electron guns and adjustment of beam entrance point. An optimum configuration of mechanical and electrical parameters provided the required low-noise figure. The STP-107 traveling-wave tube is a modification of the STP-172. Particular attention was directed toward attenuator design and construction to reduce gain fine structure. In addition, construction techniques for the envelope, r-f connection, electron gun assembly, and helix support assembly were studied. These studies, which reduced leakage and mounting problems, yielded a rugged tube meeting specifications.

Sperry Gyroscope Co., Great Neck, N. Y.
INVESTIGATION OF MICROWAVE WINDOW FAILURE MECHANISMS AND THEIR ELIMINATION, by T. Sege, D. Churchill, and others. Quarterly progress rept. no. 1, 1 June-1 Sep 59, on Contract DA 36-039-sc-78314. Oct 59, 65p. 22 refs. Sperry Rept. no. NA-8240-8182-1; AD-232 923
Order from LC mi$3.90, ph$10.80 PB 147 972

A survey of industrial and academic organizations has shown that window failure is caused by arc-over, thermal breakdown, seal failure, and dielectric puncture and cracking. The mechanisms of radiation damage, intrinsic breakdown, and thermal breakdown apparently change the structure of window materials. Sample materials are undergoing analyses to correlate crystalline structure with failure mechanism. Arc-over in both transverse and slanted surfaces is being studied using field-strength techniques. High-order mode resonances and surface losses are being investigated. (Author)

ASSOCIATION BETWEEN AURORAE AND VLF HISS OBSERVED AT BYRD STATION, ANTARCTICA, by L. H. Martin, R. A. Helliwell, and K. R. Marks. Technical rept. no. 1 on National Science Foundation Grant 9511. 29 Apr 60, 13p. 6 refs.
Order from LC mi$2.40, ph$3.30 PB 147 749

Observations through 1959 at Byrd Station, Antarctica (70.5°S Geomagnetic), show that a close association exists between aurorae and certain VLF hiss. The hiss usually occurs in a broad band with a center frequency of about 8 kc/s. The intensity and bandwidth vary with ionospheric absorption and may also vary with the intensity of the aurorae. Under conditions of extreme ionospheric absorption the intensity of the hiss drops to undetectable levels even in the presence of intense and active aurorae. There are some indications that the center frequency of this auroral hiss band may be related to the type of aurora; in particular, a center frequency of 9.6 kc/s appears to be associated with red aurora. The average field intensity of the auroral hiss lies between 1 mv/m and 3 mv/m.

Stanford Electronics Labs., Stanford U., Calif.
CAVITY AND TRAVELING-WAVE MASERS USING RUBY AT S-BAND, by W. S. C. Chang, J. Cromack, and A. E. Siegman. Rept. on Contract DA 36-039-sc-73178. 28 July 59, 25p. 6 refs. Technical rept. no. 155-2.
Order from LC mi$2.70, ph$4.80 PB 146 276

Several three-level solid-state masers using ruby have been operated at frequencies near 3000 Mc/s, using a high-efficiency cavity having TEM modes in a rectangular geometry, or a meander-line slow-traveling-wave circuit with low group velocity over the signal pass band. Various possible maser operating points in the energy-level spectrum of ruby have been studied with both structures. At good operating points, i.e. points where the observed inversion at the signal frequency is large when the pump is turned on, large gain-bandwidth products are obtained in the cavity maser and large gains/unit length in the traveling-wave maser. Although the cavity gain-bandwidth products obtained are two orders of magnitude larger than were obtained in early maser work, and are sufficiently large for some practical applications, the traveling-wave maser appears to have much more promise due to its inherently broader bandwidth, stability and built-in nonreciprocity. (Author)

TRAVELING-WAVE TECHNIQUES FOR MICROWAVE RESONANCE MEASUREMENTS, by A. E. Siegman. Rept. on Contract DA 36-039-sc-73178. 12 Oct 59, 11p. 5 refs. Technical rept. no. 155-3.
Order from LC mi$2.40, ph$3.30 PB 146 277

Recent developments in traveling-wave solid-state masers point up the utility of slow-wave circuits in comparison with cavities for magnetic resonance measurements. Among other advantages, slow-wave circuits are ideally suited for broadband or multifrequency measurements without loss of sensitivity; they readily produce circularly-polarized fields over large volumes; measurements of χ' and χ'', which involve measurements of resonant frequency and Q in a cavity, reduce to generally simpler measurements of attenuation and phase shift. Because slow-wave circuits are less widely known than cavities, this paper proposes to discuss some of their characteristics which are especially relevant to magnetic resonance measurements and to point out ways in which slow-wave circuits can be used to advantage. (Author)

Syracuse U. Research Inst., N. Y.
FERRITE POSTS IN RECTANGULAR WAVEGUIDE, by Harry Gruenberg and Arthur Cohen. Technical rept. on Contract AF 30(602)1627. 1 June 59, 51p. 17 refs. SURI rept. no. EE475-596-TR-1; RADC-TR-59-91; AD-217 679.
Order from LC mi$3.60, ph$9.30 PB 147 030

Measurements were made of the scattering matrix of a cylindrical ferrite post in a rectangular waveguide and the results are compared with an approximate theory. The theoretical formulas are used to compute the constants of the ferrite, such as dielectric constant, saturation magnetization, and loss factor, from the experimental results on thin posts. These computed values are then used to predict the scattering matrix for posts of larger diameters to see how far the theory can be extrapolated. (Author)

Technical Research Group, Syosset, N. Y.
YAGI ANTENNA STUDY, by Alan F. Kay. Scientific rept. no. 1 on Contract AF 19(604)3476. 6 Jan 60, 53p. 12 refs. TRG-121-SR-1; AFCRC-TN-60-364.
Order from LC mi$3.60, ph$9.30 PB 148 012

An experimental study of the near fields of yagis was undertaken. Quantities measured were the surface wave phase velocity, longitudinal and transverse field decay; excitation efficiency, tolerance effects, ohmic losses, and behavior near the source. Particular emphasis is given to long maximum gain yagis (up to 300λ in length) and how the above quantities enter to limit the gain. A partially empirical theory is developed from the extensive measured data which gives a simple picture of the fields around a yagi suitable for computing far field patterns without the errors of the Hansen-Woodyard theory. This theory would be applicable to other parasitic linear, endfire antennas. (Author)

Tung-Sol Electric, Inc., Bloomfield, N. J.
UTILIZATION OF SELF-SUSTAINED ELECTRON EMISSION INVESTIGATION, by B. G. Firth. Quarterly rept. no. 2, 1 Jan-31 Mar 59, on Contract DA 36-039-sc-78081. [1959] 23p. AD-217 861.
Order from LC mi$2.70, ph$4.80 PB 147 988

Five active phases of the project are discussed. (1) Completion of the magnetic analysis of electron energy distribution from the MgO self-sustained emission cathode shows a peak at 13.5 volts and 90% of electrons less than 65 volts. The curve is believed to give an energy distribution accurate to a few volts. (2) Preliminary cathode ray guns have been operated with beam currents of 0.3-0.5 ma with control grid at 300-400 volts and collector at 1500 volts. (3) Mesh dynodes for the secondary emission preamplifier have been made with an effective delta of 3. (4) A new Type DT-812C audio output amplifier tube is being designed to be more effective than the present DT-812B. It is hoped to exceed the 600 micromhos Gm of the latter. (5) Cathode research and development is in progress to (a) determine the illusive factors periodically affecting quality, (b) establish necessary controls for them, (c) improve the cathode, and (d) work out if possible an effective preprocessing method to do away with any necessity for admitting air on exhaust. The sodium activated cathode is found to start 3 to 6 times faster than the regular MgO cathode with a "daylight" lamp shining on it. (Author)

Westinghouse Electric Corp. [Lester, Pa.]
PHOTOEMITTER PREPARATION BY EMPIRICAL AND MICROBALANCE TECHNIQUES, by Eugene Heath. Rept. for 1 June 58-30 Nov 59 on Research on the Quantum Nature of Light, Contract AF 33(616)5729. Feb 60, 50p. 2 refs. WADD Technical rept. 60-5.
Order from OTS $1.25 PB 161 782

A design for a vacuum system to be used with a microbalance in the study of photosurfaces has been successfully evolved and tested. The chief problem of such a system appears to be the large volume. By reducing the volume to a minimum and by suitable baffling and restrictions, the effect of the large volume has been minimized. A photosurface of the antimony-cesium type has been successfuily formed within this system. An empirical study of photosurfaces has led to a modified multi-alkali type photosurface with a maximum overall sensitivity of 140 microamperes per lumen, a peak response shifted to approximately 6000 Å and appreciable response beyond 8000 Å. A tentative processing schedule for forming this photosurface is given. (Author)

Wisconsin U., Madison.
SURFACE WAVE AND ANTENNA ENGINEERING RESEARCH STUDY, by Elmer H. Scheibe. Quarterly progress rept. no. 1, 1 Jan-31 Mar 56, on Contract DA 36-039-sc-71158. 30 Apr 56, 12p. 8 refs.
Order from LC mi$2.40, ph$3.30 PB 147 922

Apparatus to obtain antenna gain and pattern measurements is required for the study. The first period was devoted to the design and construction of the apparatus for making these measurements. Several surface wave antennas have also been constructed.

Wisconsin U., Madison.
SURFACE WAVE AND ANTENNA ENGINEERING RESEARCH STUDY, by Elmer H. Scheibe. Quarterly progress rept. no. 2, 1 Apr-30 June 56, on Contract DA 36-039-sc-71158. 31 July 56, 24p. 8 refs.
Order from LC mi$2.70, ph$4.80 PB 147 923

The construction of the apparatus necessary for taking horizontal radiation patterns of surface wave antennas has been completed. The turntable to support and rotate the antennas is driven from the receiver location by power synchros. Microwave absorber screens behind the antenna serve to minimize room reflections. Some preliminary pattern measurements have been made on two types of surface wave antennas. The two types of antennas are the surface wave cone antenna and the surface wave dipole antenna. The results obtained for these antennas, operating at the design frequency of 9360 mc/s, appear to show promise. (Author) (See also PB 147 922)

Wisconsin U., Madison.
SURFACE WAVE AND ANTENNA ENGINEERING RESEARCH STUDY, by Elmer H. Scheibe. Quarterly progress rept. no. 3, 1 July-30 Sep 56, on Contract DA 36-039-sc-71158. 31 Oct 56, 17p. 8 refs.
Order from LC mi$2.40, ph$3.30 PB 147 924

A number of improvements were made in the antenna measuring apparatus as well as in the antenna structure itself. These improvements resulted in more reliable antenna measurements. A suitable termination for the surface wave turnstile antenna has been found, thus removing the uncertainty of the presence of a reflected wave. The preliminary horizontal and vertical pattern measurements made thus far, along with approximate gain measurements indicate, that a fairly large number of elements must be used in the turnstile arrangement if reasonable values of gain are desired. An approximate gain of 9 db was obtained for 44 elements. The optimum design has not yet been determined but a method for measuring the phase velocity along the antenna structure has been found and should aid materially in obtaining design criteria. (Author) (See also PB 147 923)

Wisconsin U., Madison.
SURFACE WAVE AND ANTENNA ENGINEERING RESEARCH STUDY, by Elmer H. Scheibe. Quarterly progress rept. no. 4, 1 Oct-31 Dec 56, on Contract DA 36-039-sc-71158. 31 Jan 57, 17p. 8 refs.
AD-130 601.
Order from LC mi$2.40, ph$3.30 PB 147 925

Detailed measurements were made on a surface-wave turnstile antenna to obtain data for optimizing antenna design. These measurements are the reduction in phase velocity along the antenna structure versus both the length and the cross-sectional area of the elements, and the attenuation along the structure versus the number of elements. Results indicated that a reduction in phase velocity along the antenna structure of more than 3% is necessary for reasonable efficiency. This 3% reduction requires 44 elements (11 wavelengths) to achieve a 9-db gain; about 66% of the input power is lost in the termination. The larger the reduction in phase velocity along the antenna, the greater is the radiating efficiency. An increase in the reduction of phase velocity is possible by choosing the proper length and diameter of elements and by increasing the number of elements per wavelength. The analytical solution of the surface wave turnstile antenna shows promise. (See also PB 147 924)

Wisconsin U., Madison.
SURFACE WAVE AND ANTENNA ENGINEERING RESEARCH STUDY, by Elmer H. Scheibe. Quarterly progress rept. no. 5, 1 Jan-31 Mar 57, on Contract DA 36-039-sc-71158. 30 Apr 57, 25p. 8 refs.
Order from LC mi$2.70, ph$4.80 PB 147 926

Measurements are presented of the gain, beam width, reduction in phase velocity, pattern, and attenuation of a turnstile type of surface wave antenna. It appears that sufficient data on this antenna has now been obtained to make possible an optimum design. (Author) (See also PB 147 925)

Wisconsin U., Madison.
SURFACE WAVE AND ANTENNA ENGINEERING RESEARCH STUDY, by Elmer H. Scheibe. Quarterly progress rept. no. 6, 1 Apr-30 June 57, on Contract DA 36-039-sc-71158. 31 July 57, 70p. 20 refs.
AD-139 776.
Order from LC mi$3.90, ph$10.80 PB 147 927

An analysis was made of the surface wave turnstile antenna. The analysis does not permit a complete antenna design since the attenuation of the wave along the structure cannot be predicted with reasonable accuracy. The calculations are based on the assumption that a line loaded with radial elements behaves like a surface wave line. Phase velocity reduction calculations are limited to cases in which the element diameter does not exceed the length. Gain and phase velocity reduction calculations agree well with the measured values. Measurements indicate that the highest gains are obtained for a small reduction in phase velocity of the surface wave along the antenna structure. When the required reduction is determined for an antenna design, the element size can be obtained by measurements or calculations. The surface wave turnstile antenna is mechanically simple to construct. The radiating elements are automatically phased by their position along the antenna structure. The antenna bandwidth is about 8% of the center frequency and is comparable to other arrays which it might replace. (See also PB 147 926)

Wisconsin U., Madison.
SURFACE WAVE AND ANTENNA ENGINEERING RESEARCH STUDY, by Elmer H. Scheibe. Quarterly progress rept. no. 7, 1 July-30 Sep 57. on Contract DA 36-039-sc-71158. 31 Oct 57, 21p. 12 refs.
Order from LC mi$2.70, ph$4.80 PB 147 928

Measurements were begun on a dielectric disc surface wave antenna. The measurements made were of a preliminary nature in an attempt to discover the factors which are important in determining the gain and pattern shape of this antenna. Two reflector type surface wave antennas were also tried. Both antennas operate on the same principle, but one has horizontal and the other vertical polarization. Patterns of these antennas have been obtained. (Author) (See also PB 147 927)

Wisconsin, U., Madison.
SURFACE WAVE AND ANTENNA ENGINEERING RESEARCH STUDY, by Elmer H. Scheibe. Quarterly progress rept. no. 8, 1 Oct-31 Dec 57, on Contract DA 36-039-sc-71158. 31 Jan 58, 50p. 13 refs.
Order from LC mi$3.30, ph$7.80 PB 147 929

A surface wave dielectric disc antenna was studied analytically and experimentally. Pattern and gain measurements agreed with predicted values when good surface wave launching efficiency was obtained. Gains of 7.5 db were obtained for reasonable size antenna structures. (Author) (See also PB 147 928)

Wisconsin U., Madison.
SURFACE WAVE AND ANTENNA ENGINEERING RESEARCH STUDY, by Elmer H. Scheibe. Final rept. for 1 Jan 56-31 Mar 58 on Contract DA 36-039-sc-71158. 30 Apr 58, 93p. 26 refs. AD-158 454.
Order from LC mi$5.40, ph$15.30 PB 147 930

The engineering research study was concentrated on 4 types of surface wave (SW) antennas: the SW turnstile antenna, the SW dielectric disk antenna (SWDDA), the SW cone, and SW reflector antennas. The SW turnstile antenna was unidirectional in the horizontal plane and capable of high gain. An approximate analysis was successful in predicting the gain and reduction in phase velocity along the structure. The SWDDA has a unidirectional pattern in the horizontal plane and has moderate gain. An analysis of an ideal SWDDA was successful in guiding the design and experimental measurements. Theoretically, high gain is possible, but because of low SW launching efficiency the maximum gain achieved was 7.5 db for a disk diameter of 24 in. at 9360 mc. The thinner the dielectric, the higher the gain. The cone antenna has a circular horizontal pattern, vertical polarization, and very low gain. The conversion of the SW field to a radiation field was not very efficient. The reflector antennas had considerable less directivity than expected. In actual tests, the antennas showed low gain and poor directivity. A proper combination appeared possible of the horizontal and vertical polarization types of reflector antennas to give circular or elliptical polarization. The SW turnstile antenna was the most successful of all the antennas studied. (Author) (See also PB 147 929)

AER, Inc. [Pasadena, Calif.]
GROUND INTERFERENCE EFFECTS ON BODIES MOVING THROUGH A COMPRESSIBLE FLUID AND THEIR APPLICATIONS TO SHORT SLED DESIGNS, by T. Y. Wu. Rept. on Contract N123-60530s-4595A. 1 July 58, 111p. 19 refs. NOTS 2118; NAVORD rept. 6420; AD 206 530.
Order from LC mi$6.00, ph$18.30 PB 147 595

Ground interference effects on the pressure distribution and lift, drag, and moment coefficients for various simple 2- and 3-dimensional bodies used in high-speed rocket-test sleds are theoretically determined for the subsonic and supersonic speed flow-regimes. The families of 2-dimensional bodies considered are: (a) single wedges, flat afterbody; (b) double-wedge sections; (c) biconvex sections; (d) thin wings, circulation present; and (e) circular cylinders. Included in the analysis for 3-dimensional bodies in subsonic flow are: (a) slender, pointed, cone-cylinders; (b) slender, pointed ogive-cylinders; (c) double ogives; and (d) finite-span lifting wings. Detached shock wave flows on 2-dimensional bodies (horizontal wedge with a flat afterbody, and upper-sided wedge with a bump on the lower surface) were also considered. This latter analysis indicates that, under certain conditions, pressures of the order of 14 atmospheres may be exerted on the underside of a rocket test sled. Various design plots are also included. APPLICATION OF TRILATERATION TECHNIQUE TO DETERMINE POSITION OF SATELLITE OR MISSILE IN SPACE, by Lee R. Avery. May 58, 11p. WADC-TN-58-141; AD-155 572.
Order from OTS $0.50 PB 151 136

The trilateration technique described herein provides an extremely accurate method for obtaining a three-dimensional location in space of satellites and other man-made vehicles. It is shown herein that a root mean square accuracy of ±160 feet in space position is obtainable. The timing circuits in the suggested method of measuring require fractional-microsecond accuracy. The achievement of these timing accuracies at widely separated points could impose requirements which would be too severe; however, a time-sharing adaptation of the proposed method could reduce the stringency of this requirement. If the accrual of scientific data requires greater positional accuracy than the present state-of-the-art allows, the satellite-positioning technique described herein is proposed. (Author)

A BEST ESTIMATE OF TRAJECTORY USING REDUCED DATA FROM VARIOUS INSTRUMENTS AT A SINGLE POINT IN TIME, by Harold L. Dibble and Charles L. Carroll, Jr. May 60, 41p. RCA Quality Analysis Technical rept. no. 10; AFMTC-TR-60-12.
Order from LC mi$3.30, ph$7.80 PB 148 061

The mathematical theory of a single point-in-time method of computing a "Best Estimate of Trajectory" utilizing reduced x, y, z data from two or more instruments is developed using the minimum variance criterion. A technique which has proven adequate for estimation of systematic errors and obtaining an estimate of the best position and best velocity data from several instrumentation systems is discussed. Related topics such as editing of input data, reduction to common tracking point and accuracy of the method are also included. (Author)

LAUNCHING OF AIRBORNE MISSILES UNDERWATER. PART III. NOTE ON LATERAL HYDRODYNAMIC FORCES DUE TO THE FREE SURFACE, by Theodore R. Goodman. Rept. on Contract Nonr-2343(00). 1 Aug 59, 10p. 1 ref. Document no. ARA-653; AD-219 758.
Order from LC mi$1.80, ph$1.80 PB 147 711

When an airborne missile is propelled from a submerged submarine it must pass from the air environment of the submarine into the water environment of the sea. Subsequently, it must pass from the sea to the atmosphere. Both as it enters and as it leaves the sea it passes through a free surface. The hydrodynamic coefficients and the buoyancy are constant when the missile is fully submerged, but are time-dependent when the missile is in the neighborhood of the free surface. It is the objective of this note to discuss when free surface effects are significant and to derive the variation in the hydrodynamic coefficients during that time. (See also PB 144 117)

A MULTIPURPOSE OPTICAL TRACKING AND RECORDING INSTRUMENT, by S. M. Lipton. May 53, 20p. 1 ref. Memo. rept. no. 688; AD-18 420.
Order from LC mi$2.40, ph$3.30 PB 148 645

A new tracking telescope type of optical recording instrument was developed for missile programs. The instrument consists of a telescopic main optical system, a motion picture camera, auxiliary guiding telescopes, a mount which moves the telescopes and camera in azimuth and elevation, and auxiliary electrical and electronic equipment. The mount must be capable of 360° azimuth rotation and slightly more than 90° elevation rotation. The instrument may be used as a cinetheodolite of moderate precision since the design and construction of the basic mount provide sufficient accuracy.

Ballistic Research Labs., Aberdeen Proving Ground, Md.
ORBITAL DATA HANDLING AND PRESENTATION, by R. E. A. Putnam. Rept. no. 3 on ARPA Satellite Fence Series. June 59, 12p. BRL Technical note no. 1265.
Order from LC mi$2.40, ph$3.30 PB 146 116

The problem of detecting dark (passive) satellites, utilizing doppler techniques, is accompanied by a need for early satellite identification. The latter requirement necessitates an expeditious handling and classification of orbital data, and a presentation of results in ways that facilitate positive and immediate identification of "strange" satellites. This report is the result of a preliminary study of prospective data handling and presentation procedures. Its purpose is to present the relative merits and limitations of various alternatives proposed, to indicate the particular methods worthy of serious consideration and further study, and to outline the time factors and development costs likely to be involved in procuring prototype equipment. Discussion is limited to a general, rather than to a specific treatment of the subject. (Author)

PRECISION CRYSTAL UNITS FOR SATELLITE USE, by J. M. Wolfskill and R. T. Schlaudecker. Quarterly progress rept. no. 2, 1 Oct-31 Dec 59, on Contract DA 36-039-sc-84556. [1959] 28p.
Order from LC mi$2.70, ph$4.80 PB 147 975

Development of designs for Phase I experimental units. 5th, 7th, 9th overtone units at 100 Mc Double "V" ribbon channel mounting arrangement. Comparison of gold plated and aluminum plated crystals. (Author)

Defense Metals Information Center, Battelle Memorial Inst., Columbus.
WELDED FABRICATION OF STEEL SOLID-PROPELLANT ROCKET-MOTOR CASES, by M. D. Randall, R. E. Monroe, and P. J. Rieppel. 31 May 60, 29p. 28 refs. DMIC memo. 56.
Order from OTS $0.50 PB 161 206

The purpose of this report is to present information in summary form that deals exclusively with solid-propellant rocket-motor cases, and to make recommendations for the welding of these cases. The materials, joint designs, welding processes, welding conditions, and inspection techniques used to fabricate solid-propellant rocket-motor cases will be discussed. This report is limited to: (1) Unclassified information, (2) Information available at the Defense Metals Information Center prior to February 29, 1960, (3) Full-size production or prototype motor cases. As a result of these limitations, some omissions resulting from the unavailability of specific data are probable.

Diamond Ordnance Fuze Labs., Washington, D. C.
180-HOUR AIRBORNE TIMER, by David S. Bettwy, Rai R. Mamoer, and John Furlani. 4 Mar 60, 22p. 1 ref. Technical rept. TR-767.
Order from LC mi$2.70, ph$4.80 PB 147 784

A lightweight program timer was developed for use in the Army lunar probe missiles. The features of this timer include (1) at least 99-percent accuracy for 180-hr operation; (2) programming of switching functions for two independent circuits; (3) operation under 1000-rpm spin; (4) operation after 100-g launching acceleration; and (5) lightweight (0.41 lb). The minimum accuracy of 99 percent was achieved in laboratory tests at room temperatures. Flight tests in a gravity-free environment would be necessary to determine if the timer can operate properly in space. (Author)

Diamond Ordnance Fuze Labs., Washington, D. C.
AN OPTICAL CAVITY TRIGGERING SCREEN, by Reinhard R. Ulrich. 20 Dec 59, 16p. 2 refs. TR-654.
Order from LC mi$2.40, ph$3.30 PB 146 341

An optical triggering screen suitable for establishing a precise time and position reference to a point on the trajectory of a projectile in flight has been designed and proved effective. By applying an adaptation of the quasi-parallel light principle, a narrow optical detection region of a uniform width of only 1/8 in. was achieved. The detector is a photomultiplier which looks into a light trap cavity. The output pulse produced by the reflection of light off a projectile as it passes through the detection region may serve to trigger a counter, an oscilloscope or another device. The positional reference can be achieved to an accuracy better than ± 0.05 in. regardless of the velocity of the projectile. (Author)

Diamond Ordnance Fuze Labs., Washington, D. C.
PRELIMINARY STUDY OF A BALLISTIC RANGING SYSTEM, by O. Dellasanta and D. L. Hamilton. 19 May 60, 24p. TR-840.
Order from LC mi$2.70, ph$4.80 PB 147 163

A preliminary investigation has been made of a ballistic ranging system using a small caliber rifle and associated optical and electronic equipment. Range finding is accomplished by utilizing bullet ballistics; that is, for a given target range a bullet will require a specific time to reach the target. The bullet flight time is determined by magnetically sensing the bullet as it leaves the gun and optically detecting a flash produced by a spotting charge within the bullet as it strikes the target. Tests indicate that the system should give an accuracy of ± 1 yd at a range of 600 yd and that the spotting charge flash can be detected at distances well over a mile. For many range finding applications the system would be limited only by the operator's ability to hit a target. (Author)

General Electric Co. [Schenectady, N. Y.]
ANALYSIS OF "BOILER" LOX TANK PRESSURIZATION MEANS FOR THE HA-3B, by W. W. Fischer. 10 Apr 53, declassified. 10p. Proj. Hermes Heat Trans. memo. no. 73A.
Order from LC mi$1.80, ph$1.80 PB 147 480

The additional data are the results of thermodynamic calculations. They are presented as a series of tables. Time is utilized as the parameter common to all these tables. The pressurizing gaseous O_2 leaves the vent line and enters the oxidizer tank at the boiler outlet temperature of 290°F.

General Electric Co. [Schenectady, N. Y.]
ANALYSIS OF "BOILERLESS" LOX TANK PRESSURIZATION MEANS FOR THE HA-3B, by Henry J. Sneck and W. W. Fischer. 18 Feb 53, declassified. 20p. Proj. Hermes Heat Trans. memo. no. 72.
Order from LC mi$2.40, ph$3.30 PB 147 478

The calculated thermodynamic data are presented as a series of curves. Included, also, is an approximate comparison of total weight of the systems.

General Electric Co. [Schenectady, N. Y.]
ANALYSIS OF HA-3B OXIDIZER TANK PRESSURIZATION UTILIZING A 0.6 #/sec., 150°F. BOILER OUTPUT, by W. W. Fischer and Nancy D. Fitzroy. 7 Aug 53, declassified. 30p. Proj. Hermes Heat Trans. memo. no. 73B.
Order from LC mi$2.70, ph$4.80 PB 147 481

Object of research was to present the results of a detailed thermodynamic analysis of the Hermes A-3B oxidizer tank pressurization system. Analysis includes prelaunch and powered flight phases of the trajectory. The effects of condensation on the oxidizer tank walls and in the vent line are included as well as the effect of cooling of the pressurizing gas as it flows through the lox vent line from the boiler to the oxidizer tank. Conduction along the oxidizer tank wall and to the forward head, and transient temperature distributions in the tank walls and in the forward head are also included.

THE EQUATIONS OF MOTION OF A TUMBLING RE-ENTRY BODY, by E. F. Dobies. Rept. on Contract DA 04-495-ORD-18. 22 Nov 57, 15p. Progress rept. no. 20-339; AD-159 890.
Order from LC mi$2.40, ph$3.30 PB 148 384

A set of equations are presented which may be used to describe the re-entry trajectory of a coasting tumbling rocket. The equations of motion are kept as general as possible, with the exception that the azimuth coordinate is linearized, and coriolis and magnus forces are neglected. (Author)

Lockheed Aircraft Corp., Sunnyvale, Calif.
MINIMUM TRANSFER TIME FOR A POWER-LIMITED ROCKET, by George Leitmann (U. of California). Technical memo. 14 Aug 59, 38p. 41 refs. LMSD-49769; AD-225 924.
Order from LC mi$3.00, ph$6.30 PB 147 680

The problem considered is that of determining the acceleration program leading to minimum transfer time for a power-limited rocket moving between prescribed positions and velocities in a constant gravitational field. It is found that flight must take place at maximum power and that the acceleration components are linear functions of time. The case of rectilinear transfer between positions of rest is treated in detail, and the results are compared with those previously obtained for a constant acceleration transfer. (Author)

Marine Corps Development Center, Quantico, Va.
4.2 INCH MORTAR KIT FOR LVTP6; TEST OF, by A. J. Honeycutt. 2 Dec 57, 16p. MCEB Proj. no. ET-1211; AD-149 141.
Order from LC mi$2.40, ph$3.30 PB 148 253

During the initial firing tests, the following deficiencies occurred: loss of torque in the beam and platform bolts, enlarged traverse lock ring holes, and failures in the block clamp assembly. The deficiencies necessitated temporary suspension of the service test and return of the carrier and the test kit to the contractor for modifications to correct the deficiencies. Subsequent to the modifications being made, engineer tests conducted at Yuma Test Station, Arizona, encountered the same deficiencies that existed during the service test. (Author)

Naval Ordnance Test Station, China Lake, Calif.
PERIODIC SURFACES AND SATELLITE ORBITS, by Stephen P. Diliberto. 1 May 59, 99p. 4 refs. NOTS TP-2153; NAVORD rept. 6445; AD-220 842.
Order from LC mi$5.40, ph$15.30 PB 148 042

A mathematical study of conservative dynamical systems is presented. For the types of systems under consideration the problem studied is that of determining integrals in addition to the energy integral - or equivalently of reducing the order of the equations. A new technique for determining a suitable coordinate system is developed. When applied to the problem of satellite orbits it is shown that certain earlier conclusions are true, but for a wider class of orbits than previously considered. (Author)

Naval Research Lab., Washington, D. C.
THE ACOUSTICAL SPECTRUM AS A TOOL FOR INVESTIGATING THE IMPACT SENSITIVITY OF EXPLOSIVES, by R. C. Bowers and J. B. Romans. Final rept. 9 May 60, 10p. 12 refs. NRL rept. 5466.
Order from LC mi$1.80, ph$1.80 PB 145 242

It has been found possible to use the acoustical spectrum as a tool to distinguish quantitatively between detonation and failure of certain explosive compositions in an impact-sensitivity test machine. The greater resolution obtained by this method is particularly useful when partial decomposition results in low-order explosions that make detection by presently used methods most difficult. Because of the superior resolving power of the method employed, RDX explosive compositions will appear to be more sensitive than when determined by conventional methods. The apparatus consisted primarily of a microphone, an oscilloscope, a sweep-timing mechanism, a sound-conducting tube, and a camera for permanently

recording the sound spectra. Successful use of the apparatus in a study of the mechanisms involved in the the desensitization of RDX explosive compositions revealed that it was possible to make measurements of the time delay between impact and explosion, to record instantaneous sound pressures, and also to estimate the propagation rate of decomposition of the explosive. Study of these properties in greater detail and an investigation of the ultrasonic spectrum would be possible by modifying the apparatus. (Author)

Naval Research Lab., Washington, D. C.
MINITRACK DATA FOR THE ARTIFICIAL EARTH SATELLITES 1958 ALPHA AND 1958 BETA FROM 7 MAY 1958 TO 20 MAY 1958, by W. M. Hocking. Project Vanguard rept. no. 32, Minitract rept. no. 5. 22 Sep 58, 47p. NRL rept. 5198.
Order from LC mi$3.30, ph$7.80 PB 146 092

The information necessary to permit satellite orbit computations from raw Minitrack data is given, and the Minitrack data on the satellites 1958 Alpha and 1958 Beta for the period 7 through 20 May 1958 are presented in appendixes. It is intended that the use of these data will encourage and facilitate the development of new computation techniques. The basic Minitrack measurement and the data message itself are described, and a discussion is made of the handling and preparation of the data message for the Vanguard IBM 704 computer.

Naval Supersonic Lab., Mass. Inst. of Tech., Cambridge.
THE DESIGN OF INFRARED EQUIPMENT FOR SATELLITE DETECTION, by Carl F. Borchert. Scientific rept. no. 1 on Contract AF 19(604)4547. Sep 59, 67p. 3 refs. Technical rept. 379; AFCRC-TN-60-255.
Order from LC mi$3.90, ph$10.80 PB 147 907

The problem of observing satellite vehicles with an infrared detector is discussed with emphasis on the design of an optimum ground based detection system. Near infrared radiation due to the passage of a satellite is assumed. Theoretical considerations for obtaining the maximum signal-to-noise ratio from the detecting element are presented with a preliminary comparison of several methods of attack. Consideration is also given to optical systems with large collector diameters and large fields of view. Some preliminary experiments are described. (Author)

Rock Island Arsenal Lab., Ill.
CHARACTERISTICS OF VCI MATERIALS WHEN APPLIED AS PACKAGING MEDIA, by Linden H. Wagner. 6 Apr 60, 18p. Rept. no. 60-1051.
Order from LC mi$2.40, ph$3.30 PB 147 431

This report covers results observed during final examination of Cal. .30 M1 Carbines and component parts after three years in open exposure (tarpaulin covered). These carbines had been packaged in four different volatile corrosion inhibitor materials meeting the requirements of Military Specification MIL-P-3420. There was no evidence of rust on the metallic surfaces of the carbines, slings, magazines, and the oilers. The VCI materials afforded adequate protection during the exposure periods. Each weapon was in a "ready to issue" condition. (Author)

Rock Island Arsenal Lab., Ill.
INVESTIGATION OF HYDROPNEUMATIC RECOIL MECHANISM PACKING SPRING LOADS, by L. R. Raisbeck. 14 Apr 60, 33p. 6 refs. Rept. no. 60-1149.
Order from LC mi$3.00, ph$6.30 PB 147 730

Conventional packings for the 75 MM Pack, 105 MM, 155 MM and 8 Inch Howitzer Hydropneumatic Recoil Mechanism floating pistons were tested in a laboratory fixture to determine the relationship between axial packing load and radial packing pressure at sub-zero, normal, and elevated temperature. Tests were conducted with leather-silver-rubber and Teflon-aluminum-rubber packings. Both types of packings were tested in a 105 MM Howitzer Hydropneumatic Recoil Mechanism to determine the relationship between Belleville spring load and their sealing effectiveness at sub-zero, normal and elevated temperatures under dynamic conditions.

Underwater Explosives Research Lab., Woods Hole Oceanographic Institution, Mass.
PHOTOGRAPHY OF UNDERWATER EXPLOSIONS, II. SUPPLEMENT: PHOTOGRAPHIC STUDIES OF SMALL CHARGES OF BLASTING GELATIN, by J. C. Decius and Elijah Swift, Jr. 15 Sep 47, 13p. 5 refs. NAVORD rept. 416.
Order from LC mi$2.40, ph$3.30 PB 148 667

Both single picture and motion picture techniques have been employed in these experiments. The equipment has been described in previous reports, the only important modifications being the omission of the flash-charge illumination in the case of the single photographs and the use of the motion picture rig at a greater depth than any previously attained. This latter depth was about 900 ft.

Virginia Agricultural Experiment Station, Blacksburg.
MULTIVARIATE SEQUENTIAL PROCEDURES FOR TESTING MEANS, by J. E. Jackson and R. A. Bradley. Technical rept. no. 10 on Development of Statistical Methods for Experimental Designs in Quality Control and Surveillance Testing, Contract Nonr-2352(01). Aug 59, 136p. 51 refs. AD-225 594.
Order from LC mi$6.90, ph$21.30 PB 148 193

Multivariate sequential inspection schemes are derived for the characteristic averages both for the case where the population variance-covariance matrix is known or assumed to be known, and where it must be estimated from the sample. When the covariance matrix is known, a sequential X^2-test is developed; when the covariance matrix is estimated from the sample, a sequential T^2-test is developed. A review is given of the pertinent literature concerning sequential analysis, the X^2- and T^2-distributions, and some hypergeometric functions. The sequential X^2- and T^2-tests are derived and the related mathematical proofs dealing with the existence and termination of these procedures are given. Some general discussions are given of topics associated with applications of the methods, i.e., the expected sample size required for the procedures, the extension of these procedures to some other multivariate situations, and the problem of relating tolerances to the specifications of the procedures. (Author)

Watertown Arsenal Labs., Mass.
CORRELATION OF TOUGHNESS BETWEEN H-PLATE AND CHARPY IMPACT TESTS, by W. P. Hatch, Jr. Sep 59, 32p. 4 refs. WAL TR 112/96; AD-225 832.
Order from OTS $1.00 PB 151 850

This report covers a post-ballistic metallurgical examination of a series of H-plates made from high and low harndess armor plate of different chemistries. Examination included chemical analyses, macro and microexamination, hardness surveys, and Charpy V notch transition tests of the armors both welded and unwelded. A correlation between transition data and ballistic performance of the H-plates is indicated. (Author)

DEVELOPMENT OF A UNIT FOR RECOVERY OF WATER AND DISPOSAL OR STORAGE OF SOLIDS FROM HUMAN WASTES. PART I. THE STUDY PHASE, by J. D. Zeff and R. A. Bambenek. Rept. on Contract AF 33(616)5783. Nov 59, 55p. 19 refs. WADC Technical rept. 58-562(I).
Order from OTS $1.50 PB 161 809

This report summarizes the results of a laboratory evaluation utilizing known techniques of water purification. Urine and feces were introduced as raw material, and the recovered water was analyzed for solid content, presence of bacteria, color turbidity, pH, and odor. Results of the water analyses indicate that techniques employing a change of phase are best for recovering water from human wastes. A design evaluation of the most successful laboratory techniques was then undertaken. The design considerations indicate that a vacuum distillation system is advantageous on a weight basis, providing the duration of flight is longer than three days and the number of crew is not more than two men. Compression distillation was found to be advantageous if the number of crew was larger than two and the duration of flight longer than seven days. It was found that vacuum distillation can utilize the excess heat of the cabin as energy, whereas the compression distillation energy requirement is ten watts of electrical energy per man per day. SELECTION OF AN ALGA FOR A PHOTOSYNTHETIC GAS EXCHANGER, by R. J. Benoit, F. Trainor, and A. Bialecki. Rept., Phase I, 16 Mar-15 July 59, on Equipment for Life Support in Aerospace, Contract AF 33(616)6344. Feb 60, 36p. 16 refs. WADD Technical rept. 60-163.
Order from OTS $1.00 PB 161 806

A detailed survey of the plant kingdom and an examination of the requirements for an effective photosynthetic gas exchanger for closed-cycle ecological systems reveal that the unicellular nonmotile (coccoid) algae stand out above all other plant forms for use in an apparatus employing a suspension of cells in a liquid growth medium. The possibility of the effective use of a system in which plants are grown on moist surfaces is explored. Of the few strains or species of coccoid algae that are well studied, a thermophilic strain of Chlorella seems to have the best combination of desirable characteristics for the closed cycle application. Nevertheless, an intense industrial-scale screening program for the discovery of even better strains of algae is suggested. (Author)

A NEW METHOD OF WASTE DISPOSAL FOR ISOLATED SITES IN THE ARCTIC. II, by John A. Logan. Rept. for 30 Sep-31 Dec 58 on Contract AF 41(657)207. May 59, 10p. Technical note AAL TN-59-6; AD-230 844.
Order from LC mi$1.80, ph$1.80 PB 146 118

Burner tests were conducted to determine requirements for a prototype oil carriage waste disposal unit. A metering system incorporating a positive displacement pump with a variable speed control was designed to replace the pressurized orifice metering system. The new system was operated for 6 hr with the sludge-oil slurry. The sludge-paper-oil slurry was burned for 5 hr at concentrations from 2 to 25% waste. The rotary cup tended to clog within about 15 min when concentrations approaching 20% were used. Fibrous waste components which accumulated behind the impeller and in the cup were easily removed. The fibrous accumulation appeared only with high concentrations, but the runs were of short duration. At low concentrations (10% or less) the oil appeared to scavenge the cup completely. Six hours running at these low concentrations seemed to indicate that clogging did not occur. Combustion appeared to be no problem with ground garbage.

EXPERIMENTAL PACKAGING FOR PROJECT MASS, by T. R. Eiler. 26 Jan 60, 37p. Rept. 1617-TR.
Order from LC mi$3.00, ph$6.30 PB 147 845

The following conclusions are applicable to the packaging of CE small repair parts for supply to troops in Europe by a MASS type of operation: (a) compared to present overseas packaging practice, only minimum preservation is required for MASS operations; (b) significant economy and simplification of packaging

An optical triggering screen suitable for establishing a precise time and position reference to a point on the trajectory of a projectile in flight has been designed and proved effective. By applying an adaptation of the quasi-parallel light principle, a narrow optical detection region of a uniform width of only 1/8 in. was achieved. The detector is a photomultiplier which looks into a light trap cavity. The output pulse produced by the reflection of light off a projectile as it passes through the detection region may serve to trigger a counter, an oscilloscope or another device. The positional reference can be achieved to an accuracy better than ± 0.05 in., regardless of the velocity of the projectile. (Author)

Diamond Ordnance Fuze Labs., Washington, D. C.
PRELIMINARY STUDY OF A BALLISTIC RANGING SYSTEM, by O. Dellasanta and D. L. Hamilton. 19 May 60, 24p. TR-540.
Order from LC mi$2.70, ph$4.80 PB 147 163

A preliminary investigation has been made of a ballistic ranging system using a small caliber rifle and associated optical and electronic equipment. Range finding is accomplished by utilizing bullet ballistics; that is, for a given target range a bullet will require a specific time to reach the target. The bullet flight time is determined by magnetically sensing the bullet as it leaves the gun and optically detecting a flash produced by a spotting charge within the bullet as it strikes the target. Tests indicate that the system should give an accuracy of ± 1 yd at a range of 600 yd and that the spotting charge flash can be detected at distances well over a mile. For many range finding applications the system would be limited only by the operator's ability to hit a target. (Author)

General Electric Co. [Schenectady, N. Y.]
ANALYSIS OF "BOILER" LOX TANK PRESSURIZATION MEANS FOR THE HA-3B, by W. W. Fischer. 10 Apr 53, declassified. 10p. Proj. Hermes Heat Trans. memo. no. 73A.
Order from LC mi$1.80, ph$1.80 PB 147 480

The additional data are the results of thermodynamic calculations. They are presented as a series of tables. Time is utilized as the parameter common to all these tables. The pressurizing gaseous O_2 leaves the vent line and enters the oxidizer tank at the boiler outlet temperature of 290°F.

General Electric Co. [Schenectady, N. Y.]
ANALYSIS OF "BOILERLESS" LOX TANK PRESSURIZATION MEANS FOR THE HA-3B, by Henry J. Sneck and W. W. Fischer. 18 Feb 53, declassified. 20p. Proj. Hermes Heat Trans. memo. no. 72.
Order from LC mi$2.40, ph$3.30 PB 147 478

The calculated thermodynamic data are presented as a series of curves. Included, also, is an approximate comparison of total weight of the systems.

General Electric Co. [Schenectady, N. Y.]
ANALYSIS OF HA-3B OXIDIZER TANK PRESSURIZATION UTILIZING A 0.6 #/sec., 1500F BOILER OUTPUT, by W. W. Fischer and Nancy D. Fitzroy. 7 Aug 53, declassified. 30p. Proj. Hermes Heat Trans. memo. no. 73B.
Order from LC mi$2.70, ph$4.80 PB 147 481

Object of research was to present the results of a detailed thermodynamic analysis of the Hermes A-3B oxidizer tank pressurization system. Analysis includes prelaunch and powered flight phases of the trajectory. The effects of condensation on the oxidizer tank walls and in the vent line are included as well as the effect of cooling of the pressurizing gas as it flows through the ion vent line from the boiler to the oxidizer tank. Conduction along the oxidizer tank wall and to the forward head, and transient temperature distributions in the tank walls and in the forward head are also included.

THE EQUATIONS OF MOTION OF A TUMBLING RE-ENTRY BODY, by E. F. Dobies. Rept. on Contract DA 04-495-ORD-18. 22 Nov 57, 15p. Progress rept. no. 20-339; AD-159 890.
Order from LC mi$2.40, ph$3.30 PB 148 384

A set of equations are presented which may be used to describe the re-entry trajectory of a coasting tumbling rocket. The equations of motion are kept as general as possible, with the exception that the azimuth coordinate is linearized, and coriolis and magnus forces are neglected. (Author)

Lockheed Aircraft Corp., Sunnyvale, Calif.
MINIMUM TRANSFER TIME FOR A POWER-LIMITED ROCKET, by George Leitmann (U. of California). Technical memo. 14 Aug 59, 38p. 41 refs. LMSD-49769; AD-225 924.
Order from LC mi$3.00, ph$6.30 PB 147 680

The problem considered is that of determining the acceleration program leading to minimum transfer time for a power-limited rocket moving between prescribed positions and velocities in a constant gravitational field. It is found that flight must take place at maximum power and that the acceleration components are linear functions of time. The case of rectilinear transfer between positions of rest is treated in detail, and the results are compared with those previously obtained for a constant acceleration transfer. (Author)

4.2 INCH MORTAR KIT FOR LVTP6, TEST OF, by A. J. Honeycutt. 2 Dec 57, 16p. MCEB Proj. no. ET-1211, AD-149 141.
Order from LC mi$2.40, ph$3.30 PB 148 253

During the initial firing tests, the following deficiencies occurred: loss of torque in the beam and platform bolts, enlarged traverse lock ring holes, and failures in the block clamp assembly. The deficiencies necessitated temporary suspension of the service test and return of the carrier and the test kit to the contractor for modifications to correct the deficiencies. Subsequent to the modifications being made, engineer tests conducted at Yuma Test Station, Arizona, encountered the same deficiencies that existed during the service test. (Author)

PERIODIC SURFACES AND SATELLITE ORBITS, by Stephen P. Diliberto. 1 May 59, 99p. 4 refs. NOTS TP-2153; NAVORD rept. 6445; AD-220 842.
Order from LC mi$5.40, ph$15.30 PB 148 042

A mathematical study of conservative dynamical systems is presented. For the types of systems under consideration the problem studied is that of determining integrals in addition to the energy integral - or equivalently of reducing the order of the equations. A new technique for determining a suitable coordinate system is developed. When applied to the problem of satellite orbits it is shown that certain earlier conclusions are true, but for a wider class of orbits than previously considered. (Author)

Naval Research Lab., Washington, D. C.
THE ACOUSTICAL SPECTRUM AS A TOOL FOR INVESTIGATING THE IMPACT SENSITIVITY OF EXPLOSIVES, by R. C. Bowers and J. B. Romans. Final rept. 9 May 60, 10p. 12 refs. NRL rept. 5466.
Order from LC mi$1.80, ph$1.80 PB 145 242

It has been found possible to use the acoustical spectrum as a tool to distinguish quantitatively between detonation and failure of certain explosive compositions in an impact-sensitivity test machine. The greater resolution obtained by this method is particularly useful when partial decomposition results in low-order explosions that make detection by presently used methods most difficult. Because of the superior resolving power of the method employed, RDX explosive compositions will appear to be more sensitive than when determined by conventional methods. The apparatus consisted primarily of a microphone, an oscilloscope, a sweep-timing mechanism, a sound-conducting tube, and a camera for permanently

recording the sound spectra. Successful use of the apparatus in a study of the mechanisms involved in the the desensitization of RDX explosive compositions revealed that it was possible to make measurements of the time delay between impact and explosion, to record instantaneous sound pressures, and also to estimate the propagation rate of decomposition of the explosive. Study of these properties in greater detail and an investigation of the ultrasonic spectrum would be possible by modifying the apparatus. (Author)

Naval Research Lab., Washington, D. C.
MINITRACK DATA FOR THE ARTIFICIAL EARTH SATELLITES 1958 ALPHA AND 1958 BETA FROM 7 MAY 1958 TO 20 MAY 1958, by W. M. Hocking. Project Vanguard rept. no. 32, Minitract rept. no. 5. 22 Sep 58, 47p. NRL rept. 5198.
Order from LC mi$3.30, ph$7.80 PB 146 092

The information necessary to permit satellite orbit computations from raw Minitrack data is given, and the Minitrack data on the satellites 1958 Alpha and 1958 Beta for the period 7 through 20 May 1958 are presented in appendixes. It is intended that the use of these data will encourage and facilitate the development of new computation techniques. The basic Minitrack measurement and the data message itself are described, and a discussion is made of the handling and preparation of the data message for the Vanguard IBM 704 computer.

Naval Supersonic Lab., Mass. Inst. of Tech., Cambridge.
THE DESIGN OF INFRARED EQUIPMENT FOR SATELLITE DETECTION, by Carl F. Borchert. Scientific rept. no. 1 on Contract AF 19(604)4547. Sep 59, 67p. 3 refs. Technical rept. 379; AFCRC-TN-60-255.
Order from LC mi$3.90, ph$10.80 PB 147 907

The problem of observing satellite vehicles with an infrared detector is discussed with emphasis on the design of an optimum ground based detection system. Near infrared radiation due to the passage of a satellite is assumed. Theoretical considerations for obtaining the maximum signal-to-noise ratio from the detecting element are presented with a preliminary comparison of several methods of attack. Consideration is also given to optical systems with large collector diameters and large fields of view. Some preliminary experiments are described. (Author)

Rock Island Arsenal Lab., Ill.
CHARACTERISTICS OF VCI MATERIALS WHEN APPLIED AS PACKAGING MEDIA, by Linden H. Wagner. 6 Apr 60, 18p. Rept. no. 60-1051.
Order from LC mi$2.40, ph$3.30 PB 147 431

This report covers results observed during final examination of Cal. .30 M1 Carbines and component parts after three years in open exposure (tarpaulin covered). These carbines had been packaged in four different volatile corrosion inhibitor materials meeting the requirements of Military Specification MIL-P-3420. There was no evidence of rust on the metallic surfaces of the carbines, slings, magazines, and the oilers. The VCI materials afforded adequate protection during the exposure periods. Each weapon was in a "ready to issue" condition. (Author)

Rock Island Arsenal Lab., Ill.
INVESTIGATION OF HYDROPNEUMATIC RECOIL MECHANISM PACKING SPRING LOADS, by L. R. Raisbeck. 14 Apr 60, 33p. 6 refs. Rept. no. 60-1149.
Order from LC mi$3.00, ph$6.30 PB 147 730

Conventional packings for the 75 MM Pack, 105 MM, 155 MM and 8 Inch Howitzer Hydropneumatic Recoil Mechanism floating pistons were tested in a laboratory fixture to determine the relationship between axial packing load and radial packing pressure at subzero, normal, and elevated temperature. Tests were conducted with leather-silver-rubber and Teflon-aluminum-rubber packings. Both types of packings were tested in a 105 MM Howitzer Hydropneumatic Recoil Mechanism to determine the relationship between Belleville spring load and their sealing effectiveness at sub-zero, normal and elevated temperatures under dynamic conditions.

Underwater Explosives Research Lab., Woods Hole Oceanographic Institution, Mass.
PHOTOGRAPHY OF UNDERWATER EXPLOSIONS, II. SUPPLEMENT: PHOTOGRAPHIC STUDIES OF SMALL CHARGES OF BLASTING GELATIN, by J. C. Decius and Elijah Swift, Jr. 15 Sep 47, 13p. 5 refs. NAVORD rept. 416.
Order from LC mi$2.40, ph$3.30 PB 148 667

Both single picture and motion picture techniques have been employed in these experiments. The equipment has been described in previous reports, the only important modifications being the omission of the flash-charge illumination in the case of the single photographs and the use of the motion picture rig at a greater depth than any previously attained. This latter depth was about 900 ft.

Virginia Agricultural Experiment Station, Blacksburg.
MULTIVARIATE SEQUENTIAL PROCEDURES FOR TESTING MEANS, by J. E. Jackson and R. A. Bradley. Technical rept. no. 10 on Development of Statistical Methods for Experimental Designs in Quality Control and Surveillance Testing, Contract Nonr-2352(01). Aug 59, 136p. 51 refs. AD-225 594.
Order from LC mi$6.90, ph$21.30 PB 148 193

Multivariate sequential inspection schemes are derived for the characteristic averages both for the case where the population variance-covariance matrix is known or assumed to be known, and where it must be estimated from the sample. When the covariance matrix is known, a sequential X^2-test is developed; when the covariance matrix is estimated from the sample, a sequential T^2-test is developed. A review is given of the pertinent literature concerning sequential analysis, the X^2- and T^2-distributions, and some hypergeometric functions. The sequential X^2- and T^2-tests are derived and the related mathematical proofs dealing with the existence and termination of these procedures are given. Some general discussions are given of topics associated with applications of the methods, i.e., the expected sample size required for the procedures, the extension of these procedures to some other multivariate situations, and the problem of relating tolerances to the specifications of the procedures. (Author)

EFFECT OF REPEATED FREEZING AND THAWING ON "C" RATIONS, by Jack D. Douglas. May 59, 7p. Technical note AAL-TN-59-7; AD-230 845.
Order from LC mi$1.80, ph$1.80 PB 146 117

A pilot study was undertaken to determine the extent of damage to C ration cans incurred during the process of freezing and thawing. Results indicated that the freezing of C ration components does not produce mechanical damage to the cans in which these components packed. Freezing does produce a physical breakdown in the components which results in a ration of lowered palatability. It was felt that freezing per se of C rations did not create a hazard to health. The physical changes produced when coupled with improper handling of the rations could facilitate bacterial action.

Naval Supply Research and Development Facility, Bayonne, N. J.
EFFECT OF COOKING AND BAKING PROCESSES ON THE STERILIZATION OF FOOD CONTAMINATED WITH BACTERIAL SPORES, by Richard R. Barton. Final rept. on Shipboard Subsistence, Proj. NT002024(CR53-89). 10 Aug 53, 43p.
Order from LC mi$3.30, ph$7.80 PB 148 038

The object of the work is to determine the ability of standard cooking procedures to sterilize foods contaminated with spores of the non-toxic bacteriological warfare simulant, Bacillus globigii. Modifications of standard cooking procedures will be developed for those foods which cannot be sterilized with standard procedures.

Vanderbilt U. School of Medicine, Nashville, Tenn.
LONG-TERM DOG FEEDING EXPERIMENT ON IRRADIATED CHICKEN, BEEF, AND JAM, by Frank R. Blood, William J. Darby and others. Progress rept. no. 1, 1 Feb 57-17 Mar 58, on Contract DA 49-007-MD-779. [1958] 14p. 3 refs.
Order from LC mi$2.40, ph$3.30 PB 148 056

Forty AKC registered beagle puppies were obtained from the Harris Hill Kennels, Elmira, New York. Seven male and seven female puppies were received 7 November 1957 and thirteen males and thirteen female puppies 13 November 1957. After a period of acclimation, the dogs were randomly divided into nine groups with two females and two males in each group; four animals were held for replacement. Feeding consists of a diet containing 35% solids of chicken, beef, or jam irradiated at 2.79×10^6 rads (X-irradiation), 5.58×10^6 rads (2 X-irradiation), and non-irradiated (control) incorporated with Purina laboratory meal. The feeding is in its twelfth week and no effects due to toxicity of the irradiated foods have been noted. (Author)

THE DYNAMIC PERFORMANCE OF EFT-B CLIMATIC PRESSURE CONTROL SYSTEMS, by W. K. McGregor, Jr. and L. F. Burns, Jr. Rept. on ARO, Inc., Contract 40(600)700 S/A 13(59-1). Nov 58, 55p. 2 refs. AEDC TR-58-11; AD-204 622.
Order from LC mi$3.60, ph$9.30 PB 146 114

The transient performance of the climatic pressure control systems of the Engine Test Facility, Basic Plant, has been analytically and experimentally defined and found to be in close agreement. The closed loop frequency response at any operating point of the air side pressure system exhibits an amplitude ratio down 3 db at 2.5 rad/sec and the exhaust pressure system down 3 db at 4 rad/sec. The maximum rates of change of pressures available for trajectory testing are dependent upon engine weight flow and can be calculated. Agreement of the calculation with experimental values is demonstrated, and an expedient method is devised to predict these rates. Typical maximum rates for a 200 lb/sec engine are exhaust pressure rate +1.5 and -2.1 psi/sec and air side pressure rate +0.5 and -0.4 psi/sec. Either inlet or exhaust pressure systems are capable of recovering to within two percent of setpoint in less than 10 sec in the case of instantaneous simulated engine flow changes up to 140 lb/sec. For small changes which do not cause the valves to travel to their extreme positions, the recovery time is about 2 sec. Typical engine accelerations introduce transient deviations as high as 2 percent while deviations for instantaneous disturbances may be as high as 20 percent. (Author)

HEAT TRANSFER EFFICIENCY OF AUTOMOTIVE ENGINE COOLANTS, by Halkey K. Ross. 17 Mar 60, 26p. 8 refs. Rept. no. CCL-90.
Order from OTS $0.75 PB 161 476

This report investigates the heat transfer properties and thermal capacities of several selected liquid mixtures and explores the possibilities of improving the presently used engine coolants with reference to cooling efficiency. A special calorimeter was constructed and specific heats of glycol-water mixtures, methanol-water mixtures, and methyl ethyl ketone-water mixtures were determined. An apparatus based on the method described by Hutchinson was built and thermal conductivities of these selected mixtures were determined. There is no promising indication that any worthwhile improvement can be made over presently used coolants with respect to heat transfer efficiency, and no mixture approaches the efficiency of water in the range of operating temperatures in the present internal combustion engines. It is recommended that improvements in heat dissipating efficiency of internal combustion engines be sought in radiator and heat exchanger designs. It may be necessary to make radical departures from the present design of radiators, both in detail and overall configuration and location in the vehicle. The greatest benefit would be realized if a substantial improvement in the thermal efficiency of the engine itself could be realized. (Author)

TURBOJET THRUST AUGMENTATION: FLIGHT TEST RESULTS FROM A REHEAT SYSTEM EMPLOYING FUEL INJECTION UPSTREAM OF A TWO-STAGE TURBINE, by E. P. Cockshutt, D. F. Daw and others. Jan 60, 59p. 12 refs. Aeronautical rept. LR-272.
Order from LC mi$3.60, ph$9.30 PB 147 735

The system was fitted to an Orenda 14 engine installed in a Sabre 6 aircraft. The reheat system was stable over the range of conditions explored, and operated satisfactorily at the ceiling of the aircraft with a tail-pipe static pressure of 3.85 p.s.i.a. A net thrust boost of 32 percent was obtained at a flight Mach number of 0.82. Combustion efficiency decreased slowly from 86 percent at sea level static to 79 percent at 50,000 feet. With the fixed oversize reheat nozzle, consistent relights were obtained up to 45,000 feet (corresponding to an altitude of 52,000 feet with a variable area nozzle in the closed position). Above 45,000 feet, results were erratic. No serious mechanical or performance troubles attributable to pre-turbine injection of the reheat fuel were experienced. (Author)

GAS DYNAMIC PROCESSES INVOLVING SUSPENDED SOLIDS, by S. L. Soo. Rept. on Project Squid, Contract Nonr-1858(25). Aug 59, 43p. 9 refs. Technical rept. PR-99-P; AD-227 904.
Order from LC mi$3.30, ph$7.80 PB 147 704

Basic gas dynamic equations involving suspended solid particles were formulated. Considerations include momentum and heat transfer between the gaseous phase and the solid phase. Significance of these contributions was illustrated with the case of expansion through a de Laval nozzle. Duct flow and normal shock problems were also discussed. Extent of earlier methods of approximation were pointed out. (Author)

HEAVY PARTICLE PROPULSION RESEARCH, by Raymond E. Weich, Jr. Rept. for 1 July-31 Dec 59 on Contract AF 49(638)657. [1960] 67p. 4 refs. Rept. RMD-1155-S2; AFOSR-TR-60-48.
Order from LC mi$3.90, ph$10.80 PB 147 519

Earlier work was primarily concerned with the generation of charged heavy particles from the liquid state. Various particle generator cells were tried, all of which performed the dual operation of charge and spray. The experimental work was limited to the generation of charged heavy particles from the solid state. The general problems of particle charging mechanisms and the effect of charge-to-mass ratio distribution upon power-plant performance were theoretically investigated. Based upon theoretical conclusions, an experimental steady flow unit was constructed. The approximate characteristics of the research unit are: mass flow rate $\doteq$ 1 milligram/sec, thrust $\doteq$ 50 to 150 dynes (voltage sensitive), performance $\doteq$ 100 sec (voltage sensitive), and a propellant of iron powder (300 Angstrom mean diameter).

RESISTANCE HOT PRESSING. Technical rept. on Contract Nonr-2407(00). Aug 59, 30p. 4 refs.
Order from LC mi$2.70, ph$4.80 PB 147 689

Resistance hot pressing of multi-component systems of metals, intermetallics and oxides has been developed as a very successful method of producing dense materials. Two types of resistance furnaces have been utilized: one is a water-cooled, metal-enclosed assembly for very rapid pressing in graphite resistance dies; the other uses graphite resistance dies, insulated with ceramic products, and will form much larger specimens. In many aspects, resistance hot pressing offers definite advantages over sintering methods and induction hot pressing. (Author)

DEVELOPMENT OF HIGH TEMPERATURE DIE MATERIALS (HOT DIE MATERIALS) by H. R. Nichols W. H. Graft and others. Final technical engineering rept. for 15 Oct 57-15 June 59 on Contract AF 33(600)35914. Oct 59, 133p. 29 refs. AMC Technical rept. 59-7-579; AD-232 717.
Order from OTS $2.50 PB 161 779

Precision, thin-walled, high-strength steel forgings for high performance aircraft and missiles can be quickly and economically forged in hot dies of Inconel 713-C using a potassium iodide-graphite lubricant-parting agent. The nickel-base casting alloy, (Inconel 713-C) proved superior to a cobalt-base alloy (HE 1049) and four other basic alloy families in oxidation resistance, hot strength stability on aging, hot wear resistance, and compressive deformation strength at temperatures as high as 1600°F. The four other alloy families were ferritic, Fe-Co-W; austenitic, Fe-Cr-W-Ni; austenitic with vanadium, columbium or tungsten carbide; and a superlattice aluminum-bearing austenite. A lubricant-parting agent, powdered potassium iodide and graphite in a ratio of 1:2, increased forging reduction and permitted metal flow at the die-work interface at die temperatures up to 1600°F. Approximately 200 test forgings of one-half of an H-beam section were produced which had a projected area of 25 square inches, including flash. Marked increases in die filling took place as the die temperature increased from 300°F to 1600°F. (Author)

Armour Research Foundation, Chicago, Ill.
METHODS AND CONTROLS FOR PRODUCING CASTABLE DIES FOR FORGING STEEL AND TITANIUM ALLOYS, by Andrew H. Murphy, Harry P. Nichols, and Paul R. Gouwens. Final technical engineering rept. for 10 June 57-10 Mar 59 on Contract AF 33(600)35530. Apr 59, 104p. 49 refs. AMC Technical rept. 59-7-578; AD-227 751.
Order from OTS $2.50 PB 161 778

High performance aircraft forgings of high-strength steels, with long, thin sections, can now be produced with a minimum of costly and time consuming machining. Forging dies capable of operating at 1600°F can be cast with cavities which require no machining. Casting molds made of special graphite mixtures provide excellent surface finish, close dimensional tolerance, finer cast grain size and good internal soundness of the high temperature resistant forging dies. These cast dies can be maintained at operating temperatures up to 1600°F and at pressures up to 80,000 psi. Die filling ability increased as the die temperatures increased, with the most favorable results occurring in the 1200°F to 1600°F temperature range. (Author)

BERYLLIUM JOINING; RAD SPONSORED PROGRAM, by J. B. Cohen. Rept. for July 58-Oct 59 on Contract AF 33(616)5913. Apr 60, 45p. 23 refs. WADC Technical rept. 59-695, Pt. I.
Order from OTS $1.25 PB 161 830

New brazing techniques are described for joining beryllium to itself. A Be-20 a/o Ag brazing alloy developed under this program is shown to yield joint strengths at room temperature of 60 percent (30,000 psi) of that of the base metal. In the temperature range of 700 to 1450°F, the joint strength is 80 percent that of the base metal. Twenty-four hour exposures at these temperatures did not affect the room temperature strength. Similar strengths are achieved by brazing with pure silver, if a continuous interface of silver in the joint is absent. This is readily accomplished by heat treatment because of the rapid intergranular penetration of silver into beryllium. The resulting thick joint is not deleterious, since it is shown that a two phase silver beryllium alloy with a silver network is ductile. As in the above case, long time exposure (24 hrs) at temperatures above 1300°F did not affect the room temperature joint strength. Spreading of liquid silver on beryllium is not appreciable, probably because of its rapid intergranular penetration. (Author)

Avco Corp., Wilmington, Mass.
BERYLLIUM JOINING; WADC SPONSORED PROGRAM, by E. M. Passmore. Rept. for June 58-Oct 59 on Metallic Materials, Contract AF 33(616)5913. Apr 60, 127p. 25 refs. WADC Technical rept. 59-695, Pt. II.
Order from OTS $2.75 PB 161 831

Joining of beryllium plates and rods by braze welding, fusion welding, and pressure welding was investigated, with the objective of developing improved methods for applications at both room and elevated temperatures. From the work described in this report, it can be concluded that braze welding with silver filler metal and pressure welding without filler offer the most promise as useful joining techniques for beryllium. PROBLEMS WITH RESTRAINT IN HEAVY WELDMENTS, by Glenn E. Faulkner. 29 Apr 60, 10p. DMIC memo. 54.
Order from OTS $0.50 PB 161 204

One of the important phases of research to evaluate thick titanium plate for use in deep-diving submarines is the evaluation of welded joints in thick titanium-alloy plates. As part of the weld-evaluation program, procedures will be developed for welding 2-inch-thick plates. These plates will be 30 inches long. Restraint in weldments of this size is high. Restraint in welding is the restriction of expansion and contraction during the heating and cooling cycles of welding operations.

Denver Research Inst., Colo.
SURVEY OF THE BROACHING PROCESS, by Bruce Hanna and Charles E. Eppinger. Final technical engineering rept. for Mar-Dec 59 on Contract AF 33(600)39008. Jan 60, 126p. 205 refs. AMC Technical rept. 60-7-645.
Order from OTS $2.75 PB 161 776

An extensive survey of the broaching process was performed to determine current status, problem areas, current efforts at resolution of problems, and needed developments. In addition to a survey of broaching literature, fifty-one organizations were contacted for information. The effect of broach gullets on cutting action and certain characteristic economic considerations were treated analytically. Broaching has been developed into a highly efficient method of metal removal with inherent accuracy and efficiency. Difficult-to-machine high temperature alloys have created broaching problems of which short tool life is the most serious. Current efforts toward resolution are limited in extent. Improved tool materials, broach design information, and comprehensive broach life data are needed. (Author)

FUNDAMENTAL MODE FILTER CRYSTALS, by F. Earle Clark. Quarterly progress rept. no. 3, 21 Nov 57-21 Feb 58, on Contract DA 36-039-sc-73234. 20 June 58, 19p. H. E. Proj. no. F-297.
Order from LC mi$2.40, ph$3.30 PB 147 984

Final development of a spurious mode identification and mapping device is described. Data on both circular and triangular AT plates gathered with the mode mapping device as well as with conventional techniques is presented. Physically identical crystals show individual characteristics to an unexpected degree. Conclusions based on the data are presented including some ideas on the behavior of triangular crystals. Triangular crystals have more freedom from spurious modes than equivalent circular crystals. Reduction of electrode size on both circular and triangular crystals removes some of the drive from spurious modes. (Author) (See also PB 140 600)

Naval Ordnance Test Station, China Lake, Calif.
THE EXPLOSIVE WORKING OF METALS, by John Pearson. 4 Feb 60, 54p. 47 refs. NOTS TP 2421; NAVORD rept. 7035.
Order from OTS $1.50 PB 161 828

Many metal working operations such as the forming, sizing, shaping, cutting, compacting, and welding of parts can now be performed by the energy released from either a detonating or deflagrating explosive. Several of these basic types of operations are currently in use on a production basis, the others are still in the applied research area of investigation. Both open and closed systems are employed with "standoff" and "contact" charges used to develop working pressures ranging from a few thousand to several million psi. Fundamental aspects of pressures, forces, and velocities pertinent to explosive metal working operations are discussed. Material behavior patterns are briefly considered. Several of the above operations are described in some detail. (Author)

THE CONCEPTS OF NOTIONAL SHIP AND NOTIONAL VALUE IN LOGISTIC CAPABILITY STUDIES INVOLVING MERCHANT SHIPS, by Ralph B. Hunt and Erling F. Rosholdt. Rept. on Logistics Research Project, Contract Nonr-761(05). 21 Aug 59, 12p. Serial T-103/59; AD-225 901.
Order from LC mi$2.40, ph$3.30 PB 148 156

A primary logistic planning operation is described for determining how many ships are required to transport a given quantity of cargo (dry, liquid, or human) from one point to another according to a particular lift requirement schedule. For studies involving ships, the concepts of a notional ship and of a

notional value of an actual ship are considered. The procedures for determining the number of notional ships for a given lift requirement schedule were previously described (AD-217 232). It is necessary to convert the number of notional ships required over each route to the number of actual ships required. The total actual ship requirements are obtained by applying the concept of the notional value of an actual ship which is a function of the distance (route) over which the ship operates. This factor may be handled 2 ways: (1) to determine the notional value of each actual ship for every route for which the number of notional ships needed were determined, and (2) to decide on a standard reference distance (notional distance) and convert the notional ship requirements, as calculated for the different routes, to the notional ship equivalent at the notional distance selected. An example is worked out using these concepts.

Universal Molded Products Corp., Bristol, Va.
ENGINEERING INVESTIGATION OF RUBBER OR PLASTIC MATERIAL FOR TRUCK COMPONENTS, by LeRoy R. Boggs. Final rept. on Contract DA 20-089-ORD-37127. 20 June 56, 16p. AD-202 133.
Order from LC mi$2.40, ph$3.30 PB 147 593

An engineering investigation was conducted of rubber, reinforced rubber, plastics, reinforced plastics or other materials as superior substitute for metal in the construction of various body parts for the 3/4 ton, 4 x 4 truck. Specified evaluation criteria were as follows: (a) resistance to atmosphere exposure, (b) resistance to fungi, (c) resistance to impact, (d) resistance to flame, (e) lightweight, (f) ease of field repair, (g) production efficiency, and (h) ease of initiating new production. Fiberglass reinforced polyester plastic was the best substitute for metal as a material for typical body components of tactical vehicles such as the M-37 truck. To best utilize the desirable properties of this material, the fundamental design of the application should be made around these properties. For example, if original design of a body component takes into account the low elastic modulus, the fabrication liberties of form, shape and local integral reinforcement and the other unusual properties of this material, then a much more efficient design will result than if a mere material substitution is made in a design originally intended for an entirely different material such as steel. Under such favorable design conditions, there are many applications in which this material would be clearly superior to steel or any other known material. Production of truck body components of this material is feasible in a wide range of quantities. Techniques used in this project represent moderate quantity methods but higher production rates appear equally feasible. (Author)

PLASTIC-GLASS FIBER REINFORCEMENT FOR REINFORCED AND PRESTRESSED CONCRETE, by Bryant Mather and R. V. Tye. Summary of information available to 1 July 55. Nov 55, 62p. 78 refs. Technical Memo. no. 6-421, rept. 1.
Order from LC mi$3.90, ph$10.80 PB 148 085

Information on use of glass and reinforcement in concrete is summarized and evaluated. Solid strip glass was studied in Europe in the 1930's but probably is not currently practical. Since 1951 promising studies have been made of glass fiber reinforced plastic rods as prestressing. Glass with relatively low modulus of elasticity, high tensile strength, and low specific gravity should be superior to steel if these properties can be employed conveniently, safely, and consistently. (Author)

Army Engineer Waterways Experiment Station, Vicksburg, Miss.
PLASTIC-GLASS FIBER REINFORCEMENT FOR REINFORCED AND PRESTRESSED CONCRETE, by Leonard Pepper and Bryant Mather. Summary of Information Available 1 July 55-to 1 Jan 59. Nov 59, 23p. 19 refs. Technical memo. no. 6-421, rept. 2.
Order from LC mi$2.70, ph$4.80 PB 148 086

Reports of work in Germany and Russia involving fiber glass and information obtained from domestic and foreign agencies, companies, and scientific organizations concerning use of fiber-glass reinforcing and prestressing elements for concrete are summarized. This information suggests the present availability of fiber glass possessing the mechanical characteristics necessary for a prestressing element. However, fiber glass cannot be used for this purpose without adequate protection from surface attack by the environment, and the available fiberglass-reinforced plastic systems do not possess the mechanical characteristics necessary for a prestressing element. Additional experimental work along lines that can now be described should provide the necessary background for specification of fiberglass-reinforced plastic units as an alternate to steel in prestressed-concrete construction. (Author)

Ceramics and Refractories

Armour Research Foundation, Chicago, Ill.
INVESTIGATION OF GRAPHITE BODIES, by Samuel W. Bradstreet, Leon M. Atlas and others. Rept. for 1 Oct 58-1 Nov 59 on Ceramic and Cermet Materials, Contract AF 33(616)6143. Apr 60, 116p. WADC Technical rept. 59-706.
Order from OTS $2.50 PB 161 802

In investigating the influence of composition and processing variables on certain properties of small, molded multicrystalline graphite, non-impregnated specimens have been made at densities above 1.8 gm/cc to exhibit flexural strengths in excess of 350(psi at 20°C and 8000 psi at 2250°C. Concomitant studies have involved techniques of differential thermal analysis and dilatometry in binder investigation, a novel method of measuring tensile strength in brittle ring specimens, measurement of strengths and moduli to temperatures above 2850°C, and additions of a thermal carbon to coke flour as an inter-packing aggregate. The value of furfuryl alcohol polymer as a binder is confirmed. (Author)

Cornell Aeronautical Lab., Inc., Buffalo, N. Y.
AN INVESTIGATION OF THE THEORETICAL AND PRACTICAL ASPECTS OF THE THERMAL EXPANSION OF CERAMIC MATERIALS. VOLUME ONE. LITERATURE SURVEY, by Raymond H. Stutzman, John R. Salvaggi and Henry P. Kirchner. Summary rept. for 1 July 58-31 Aug 59 on Contract NOrd-18419. 31 Aug 59, 162p. 954 refs. Rept. no. PI-1273-M-4; AD-220 685.
Order from OTS $3.00 PB 161 826

A literature survey was conducted on the reversible thermal expansion of crystalline ceramics, rocks and minerals, glasses, cermets, intermetallic compounds salts, cements, glazes, enamels and ceramics combined with other types of materials. Approximately 1200 references were collected of which 954 are assembled in a bibliography. 523 of the articles and reports were reviewed in detail and the results of thermal expansion measurements are published in tabular form (Author)

LOW-TEMPERATURE BRITTLENESS OF REFRACTORY METALS, by H. W. Schadler and J. R. Low, Jr. Annual summary rept. for 15 June 58-31 July 59 on Contract Nonr-2614(00). Aug 59, 43p. 34 refs. AD-226 968.
Order from LC mi$3.30, ph$7.80 PB 147 720

Dislocation etch pits in tungsten: A study was made of the dislocation etch-pitting technique of Wolff (Acta Met., 6:559, 1958). The study showed that this technique reveals dislocation reproducibly, and that no decoration of the dislocations is required. An etch-pitting technique was developed that employes a stainless steel sheet cathode, and an NaOH electrolyte with the specimen as anode. Electron beam melting: Equipment was constructed for the zone purification of refractory metals; it was used to melt W, Ta, Fe, and Ni. Measurements of electrical resistivity and mechanical properties of W single crystals indicated that purification is accomplished both by vacuum distilling and by zone refining. Deformation behavior of zone-melted W single crystals: Tungsten single crystals grown by electron bombardment floating zone refining were strained 2% in tension and bending at 298°, 77°, and 20°K to determine the modes and crystallography of the plastic deformation. The temperature dependence of the yield strength of W single crystals: The temperature dependence of the yield of W was measured using single crystals of zone-refined W of a variety of orientations. To eliminate the crystal orientation as a variable, the tensile yield strength was converted to a resolved shear stress on slip systems of the type (011) [111]. The average values of the resolved shear stress were a linear function of reciprocal absolute temperature as the theory of Fisher (Trans. Am Soc Metals, 47:451, 1955) predicts.

Georgia Inst. of Tech. Engineering Experiment Station, Atlanta.
INVESTIGATION OF HIGH TEMPERATURE RESISTANT MATERIALS, by J. D. Walton and C. R. Mason, Quarterly rept. no. 11, 1 Feb-31 Apr 58, on Contract NOrd-15701. [1958] 35p.
Order from LC mi$3.00, ph$6.30 PB 148 455

Zirconium-carbide- and titanium-carbide-forming thermite reactions were studied with regard to throttling materials (alumina versus kaolin, EPK), binders (core oil versus a saturated solution of aluminum hydroxide), carbon source for carbide-forming (graphite versus lampblack), and various shrouding techniques during ignition. Nozzles fabricated using the thermite reaction between fused silica and aluminum, with fused silica as the throttling material, were too weakly bonded to withstand the physical shock of the start cycle on the small rocket test stand. Nozzles fabricated using the zirconium-carbide-forming thermite reaction with EPK as the throttling material melted rapidly when tested on the small rocket motor. Erratic results were found to be caused by discrepancies in fabricating techniques.

Illinois U., Urbana.
NONDESTRUCTIVE TESTS FOR CERAMIC, CERMET AND GRAPHITE MATERIALS, by Julian H. Lauchner. Dwight G. Bennett, and George L. Morgan. Rept. for 1 July 58-30 June 59 on Materials Analysis and Evaluation Techniques, Contract AF 33(616)5687. Nov 59, 61p. 41 refs. WADC Technical rept. 59-412.
Order from OTS $1.75 PB 161 815

A feasibility study of several nondestructive tests as methods for predicting performance characteristics of ceramic, cermet and graphite materials was carried out. Radiographic identification of internal flaws, penetrant identification of external flaws, density measurements, and residual stress analyses were

employed in nondestructive evaluation. In the absence of viscous or plastic flow, external flaws were found to markedly affect material strength, whereas internal flaws were, in some cases, found to be of secondary importance. Residual stress developments in composite bodies were analyzed. Thermal expansion, elastic moduli, shape factors and heat treatments were employed. Such residual stress was observed to be a first order factor in predicting performance characteristics. Static strengths of alumina bodies correlated well with particle sizes as determined by X-ray back reflection. (Author)

RESEARCH INVESTIGATION TO DETERMINE THE OPTIMUM CONDITIONS FOR GROWING SINGLE CRYSTALS OF SELECTED BORIDES, SILICIDES AND CARBIDES, by A. D. Kiffer. Rept. for Mar 59-Feb 60 on Ceramic and Cermet Materials, Contract AF 33(616)6326. Apr 60, 31p. 8 refs. WADD Technical rept. 60-52.
Order from OTS $1.00 PB 161 792

This work was undertaken to produce selected crystals in the refractory hard metals class for mechanical and other property determinations. A Verneuil-type process using an arc heat source and argon shield gas was employed. Single crystal boules of titanium diboride and tungsten disilicide, 1/4-inch diameter and up to 4-1/2-inches long, were made. Most of them cracked upon cooling. The largest single crystal pieces recovered were 1/4-inch diameter and over 1/2-inch long. Dimolybdenum carbide boules had large sections of a "single crystal" Mo_2C matrix containing about 10% by volume of another phase distributed uniformly through it. No Mo_2C single crystal pieces free from this phase were made. In very limited work with ditungsten pentaboride only polycrystalline boules were produced. A major problem was encountered in getting powders suitable for Verneuil-type crystal growth. Best results were obtained from compounds prepared by fusing together commercially available pure elements and crushing the lumps into a suitable particle size fraction. Process improvements and purer powders are required to produce better quality TiB_2 and WSi_2 crystals. More experimental information is required on the molybdenum-carbon and the tungsten-boron systems. (Author)

AMMONIUM NITRATE FUEL BLOCKS, by Edward P. Cole. Rept. for Mar 54-Mar 55. Feb 60, 26p. Special Pub. 1-10; AD-234 129.
Order from LC mi$2.70, ph$4.80 PB 147 626

The object of the work described in this report was to determine whether the physical variables inherent in the procedure for loading AN-M7 smoke-pot fuel blocks had any noticeable effect on the observed tendency of the blocks to swell during storage. No relationship was found between consolidation pressure, ram dwell time, or the presence of a cellulose-nitrate disk seal, and the tendency of fuel blocks to swell. There was a correlation between slight swelling and (1) the addition of 2% water to the fuel mixtures prior to consolidation and (2) consolidation of the fuel mixture in one increment instead of two. It was also found that the starter mixture showed signs of swelling, that blocks having a concave top surface swelled, and that "fast" (MIL-STD-545) fuel mixtures showed considerably greater swelling than pure ammonium nitrate blocks. All the miniature fuel blocks used in the experiments swelled after storage. No change in the physical variables inherent in the loading procedure of fuel blocks is capable of completely eliminating the tendency of ammonium nitrate fuel blocks to swell. (Author)

THE APPARENT ORDER OF HETEROGENEOUS SPRAY REACTIONS, by F. A. Williams. [Technical] rept. no. 27 on Contract DA 04-495-ORD-446. Sep 58, 7p. 5 refs. AD-203 812.
Order from LC mi$1.80, ph$1.80 PB 138 160

The order and rate of a heterogeneous reaction involving liquid or solid particles in a gaseous medium are sometimes measured in devices which produce a steady flow of the heterogeneous mixture. It is proposed to show that the apparent order of the reaction (with respect to the material composing the particles) obtained in this manner is primarily a function of the particle size distribution and is largely independent of the single-particle reaction order.

HYDROGEN PEROXIDE LABORATORIES, by W. C. Schumb and C. N. Satterfield. Quarterly periodic status rept. on Contract Nonr-1841(11). 30 June 59, 14p. AD-220 223.
Order from LC mi$2.40, ph$3.30 PB 146 281

Stability studies: A study of the decomposition rates of dilute solutions of H_2O_2 was begun in an attempt to establish the true shape of the decomposition rate vs concentration curve; principal consideration was given to the 5 to 30% concentration range. Although a moderate variance in results occurred, a gradual increase in decomposition rate was indicated as the H_2O_2 concentration decreased. H_2O_2 decomposition flame at subatmospheric pressures: The best cleanliness, mechanical flexibility, and temperature controllability of the boiler flask was obtained with a 6-ft, 108-w heating tape. There were no marked improvements in preventing ignitions of the solution in the boiler, nor in the behavior of the boiler flask system. A ground, jointed Y-connection was added to the side arm of the boiler flasks to decrease the pressure fluctuations in the boiler. Porous-walled reactor studies: Carbon dioxide was more effective than N as an injectant into the H_2O_2 decomposition system. The surface rate constant for H_2O_2 decomposition ranged from 1.6 to 2.2×10^{-4} g mol/sq cm(min) (atm) when CO_2 and N, respectively, were used as carrier gases with no injections. Decomposition of H_2O_2 vapor on catalytic surfaces: Two sets of runs were made to determine the combinations of temperature, velocity, and H_2O_2 concentration under which mass transfer is not controlling on an active catalyst surface (silver). At 50°C the ratio of experimental rate to that for the mass transfer which was controlled averaged 0.46; at 40°C the average was 0.27. One-fourth of the H_2O_2 entering the tube decomposed. (See also PB 139 967)

Materials Lab., Wright Air Development Div., Wright-Patterson AFB, Ohio.
STORAGE STABILITY OF FLUIDS AND LUBRICANTS. PART II. ROOM TEMPERATURE STORAGE OF AIRCRAFT GREASES, by John B. Christian. Rept. for June 55-June 57 on Transmission Technology. Apr 60, 20p. 5 refs. WADC Technical rept. 58-287, Pt. II.
Order from OTS $0.50 PB 161 808

Eleven greases qualified under Military Specifications MIL-G-3278, MIL-L-3545, MIL-L-4343, MIL-G-7421, and MIL-L-7711, and supplied by various manufacturers were placed in storage at room temperature for two years. The greases were examined periodically to determine if storage had affected any of their properties. At the termination of two years of storage, it was discovered large changes in consistency had occurred in three out of four Specification MIL-L-7711 greases. The properties of these greases were no longer within specification limitations. All other greases maintained minimum requirements. (Author)

EVALUATION OF "COSAG" FUELS, by H. E. Meyer. Evaluation rept. 20 Feb 58, 40p. NBTL Test P-305; AD-205 997.
Order from LC mi$3.00, ph$6.30 PB 146 292

Twenty-two distillate type fuels were subjected to laboratory examination; three of these fuels to full scale boiler tests. The laboratory results showed that all fuels were adversely affected by sea water contamination; some indications of incompatibility also were encountered. Meter and pump failures and sprayer plate erosion represent the principal difficulties requiring design studies before the adoption of such fuels for naval use. A specification for ash-free fuels suitable for under boiler service was formulated

Radiation Effects Information Center, Battelle Memorial Inst., Columbus, Ohio.
THE EFFECT OF NUCLEAR RADIATION ON LUBRICANTS AND HYDRAULIC FLUIDS, by S. L. Cosgrove. Rept. on Contract AF 33(616)5171. 30 Apr 58, 80p. 50 refs. REIC rept. no. 4; AD-154 432.
Order from LC mi$4.50, ph$12.30 PB 147 102

This report presents the state of the art of the effect of nuclear radiation on aircraft lubricants and hydraulic fluids from 1955 through 1957. A brief review of the mechanism by which organic materials degrade chemically under the influence of nuclear radiation is followed by a discussion of the radiation stability of current aircraft lubricants and hydraulic fluids. In general, military-specification aircraft lubricants and hydraulic fluids show inadequate radiation stability for projected ANP purposes. The incorporation of antirads into these materials does not provide the necessary additional stability. Aromatic compounds, specifically alkyl biphenyls, and substituted aromatic ethers, show the most promise as radiation-resistant base stocks. In most cases their performance properties have yet to be fully evaluated, especially under in-source, or dynamic irradiation, conditions. Lubricants are categorized by function; radiation-resistant lubricant and hydraulic-fluid development programs are reviewed by chemical species rather than by the contracting agency responsible for their development. The appendixes contain selected tabular data showing the effects of radiation on both conventional materials and those developed for projected ANP use. (Author)

Radiation Effects Information Center, Battelle Memorial Inst., Columbus, Ohio.
THE EFFECT OF NUCLEAR RADIATION ON LUBRICANTS AND HYDRAULIC FLUIDS (FIRST ADDENDUM) by S. L. Cosgrove. Rept. on Contract AF 33(616)5171. 31 Mar 59, 51p. 42 refs. REIC rept. no. 4 (Addendum); AD-210 760.
Order from LC mi$3.60, ph$9.30 PB 147 102-S-1

This report reviews publications, reports and other communications received during 1958. Those basic radiation studies on organic compounds of significance to lubricant and hydraulic fluid development are reviewed, and their significance is discussed. Radiation-resistant gas-turbine-lubricant development during the past year has centered around the expanded study of polyphenyl ethers and alkylated aromatic ethers. Meta-linked polyphenyl ethers (uninhibited) show promise for use in the 0 to 700 F range and at exposures up to 1×10^{11} ergs g^{-1}(C). Alkylated aromatic ethers (containing antioxidants) are somewhat less radiation stable, but show a useful temperature range of approximately -35 to 600 F. Alkylated diphenyl ethers and diaryl alkanes show the most promise for use in conventional hydraulic systems under irradiation conditions. In hydraulic systems which would tolerate high pour points (about 5F) and marginal high-temperature viscosity, unsubstituted polyphenyl ethers could be used to advantage. The combination of radiation-stable fluids and modified soap (terephthalamates) or nonsoap thickeners has resulted in greases of adequate radiation stability for anticipated ANP needs. Likewise, commercially available dry-film lubricants show adequate radiation stability for anticipated ANP applications. (Author) (See also PB 147 102)

Rock Island Arsenal Lab., Ill.
A STUDY OF THE LUBRICITY OF A SULFURIZED COATING, by G. P. Murphy and F. S. Meade. 26 Apr 60, 10p. 2 refs. Rept. no. 60-1308.
Order from LC mi$1.80, ph$1.80 PB 147 731

Test specimens were sulfurized by a commercial firm. The lubricity of the coating was evaluated both dry and with a mineral oil. The coating was also evaluated as a pretreatment for resin bonded dry lubricants. When the sulfurized specimens were evaluated dry for wear resistance and antiseizure, it was determined that the sulfurized coating offered no improvement in wear resistance and only slight improvement in antiseizure when compared with plain steel specimens. However,

as a pretreatment for both oil and resin bonded dry lubricants, the sulfurized coating was superior to both plain steel and zinc phosphated (MIL-C-16232, Type Z) steel with regard to wear resistance. The antiseizure characteristics of the sulfurized coating was superior to the plain steel and equivalent to zinc phosphated steel. (Author)

TRAINING COURSE AND INSTRUCTIONS FOR FOAMING-IN-PLACE AND THERMAL-FORMING REPAIR OF FOAMED STRUCTURES, by H. R. Moore and R. A. Coen. 8 Feb 55, 23p. 10 refs. Rept. no. NADC-EL-54151; AD-126 873.
Order from LC mi$2.70, ph$4.80 PB 138 073

This report was prepared to describe a training course and the necessary instructions on foaming-in-place and thermal-forming techniques for repairing the two main classifications of damage encountered by foamed structures, namely: (1) Damage to core accompanied by rupture of one or both skins. (2) Delamination of core from skin, not requiring replacement of skin or core by patching.

Army Engineer Research and Development Labs., Fort Belvoir, Va.
EFFECT OF AN EMBOSSED PATTERN ON THE RIGIDITY OF PLASTICS, by Paul A. Signet. 15 Oct 58, 10p. Rept. no. 6126-3; AD-211 690.
Order from LC mi$1.80, ph$1.80 PB 146 279

This report covers an investigation of the effect of vacuum forming sheets of polyvinyl chloride in accordance with a pattern reported to have no axes of weaknesses. An aluminum mold was used to vacuum form the sheets. Specimens were cut and tested in bending at angles of 30, 60, 90, 120, and 150 degrees to an arbitrarily chosen axis. Combinations of two sheets were tested to determine if an increase in rigidity could be obtained. These included bonding together of two sheets with no special attempt at alignment, and bonding together of two sheets with an alignment of the pattern. It is concluded that the effect of embossing the sheet with the pattern resulted in a sheet with no axis of weakness and a great increase in rigidity.

Army Engineer Waterways Experiment Station, Vicksburg, Miss.
EPOXY RESINS FOR USE ON CIVIL WORKS PROJECTS, by Leonard Pepper. Summary of data available as of 1 Mar 59. Aug 59, 55p. 39 refs. Technical rept. no. 6-521, rept. 1.
Order from LC mi$3.60, ph$9.30 PB 148 089

This report reviews the available literature and manufacturers' publications to determine the potential uses of epoxy resins on Civil Works projects. These possible uses fall into three general categories: adhesives, fillers, and coatings. Specific applications that have proved successful include: (a) bonding hardened concrete to hardened concrete; (b) bonding freshly mixed concrete to hardened concrete; (c) sealing cracks in concrete; (d) filling voids, pop-outs, and spalls in concrete; (e) refacing worn concrete or steel surfaces; (f) coating concrete or other surfaces for resistance to chemical attack; (g) protecting electrical components; and (h) bonding attached or embedded items such as dowels, reflector buttons, traffic bars, etc., to concrete. It is recommended that investigations of epoxy-resin systems be continued to: (1) define the uses that are most economically attractive; (2) develop specific performance specifications applicable to such uses; and (3) develop application procedures and information on performance in service. (Author)

Emerson and Cuming, Inc., Canton, Mass.
DEVELOPMENT OF INORGANIC FOAM MATERIAL OF CONTROLLED DIELECTRIC PROPERTIES FOR HIGH TEMPERATURE SERVICE. Final rept. 5 Nov 56-15 Dec 58 on Contract NOas-57-357-c. 18 Dec 58, 26p. AD-211 222.
Order from LC mi$2.70, ph$4.80 PB 146 291

A low density (18 to 30 lbs. per cubic foot) fine grained structural material capable of withstanding 900°F has been developed by autogenous bonding of tiny glass bubbles. Research on bonding techniques including silicone resin bonds, as well as the autogenous bond is described.) This structural material has been modified by additions of aluminum flake or titanium dioxide powder to give controlled dielectric constant structures having relatively low dielectric loss. Increase in service temperature range of these materials by 500 to 1000°F is believed possible by chemical modification of the Eccosphere glass composition.

National Research Labs., Ottawa (Canada).
A TECHNIQUE FOR PRODUCING GLASS-REINFORCED FOAM-FILLED PLASTIC MODEL PROPELLER BLADES, by A. J. Bowker and L. A. J. Pelland. Jan 60, 31p. 12 refs. Aeronautical rept. LR-273.
Order from LC mi$3.00, ph$6.30 PB 147 734

A procedure for making foam-filled glass-reinforced model plastic propeller blades is described in some detail, and the resulting blade is compared with similar blades of wood and aluminum. The plastic blade compares favourably to wood and aluminum in all respects except strength, where aluminum proves more advantageous. Also, extremely thin blades might be difficult to fabricate accurately in plastic. It would appear, with regard to strength, rigidity, duplicability, dimensional accuracy and stability, that the wood is always inferior and that the expense involved in reproducing aluminum blades is warranted only when excessive stresses or very thin sections are involved. (Author)

Springfield Armory, Mass.
INVESTIGATION OF HIGH DENSITY RIGID FOAMS, by K. A. Jorczak. Rept. on Research of Materials for High Temperature Uses. 20 Nov 59, 10p. SA-TR18-1068.
Order from LC mi$1.80, ph$1.80 PB 146 944

An investigation was conducted to obtain data to ascertain whether urethane foam materials (20 lb/cu ft)

can be increased to higher densities and to determine the practicality of using fiber glass as a filler. Results indicate that rigid urethane foams of a density greater than 20 lb/cu ft can be molded and that fiber glass filler does not influence significantly the physical properties of the foams. Test procedures are given, and results discussed. (Author)

Rubber and Elastomers

Naval Ordnance Lab., White Oak, Md.
DEVELOPMENT OF AN OZONE RESISTANT SYNTHETIC RUBBER COMPOUND FOR LOW TEMPERATURE SERVICE, by Doris V. Steele and H. E. Mathews, Jr. 4 Dec 58, 25p. 6 refs. NAVORD rept. 6241; AD-214 482.
Order from LC mi$2.70, ph$4.80 PB 146 289

A program to develop rubber diaphragms for the Hydrostatic Switch XH-46C was carried out. Various formulations based on a styrene-butadiene polymer were compounded and evaluated for low temperature flexibility, aging, and ozone resistance under outdoor and accelerated laboratory environmental conditioning.

Rubber Lab., Mare Island Naval Shipyard, Vallejo, Calif.
DEVELOPMENT OF METHOD FOR DETERMINING RESISTANCE OF RUBBER TO ABRASION BY SAND-BLAST, by J. Oser. 11 May 59, 14p. 4 refs. Rept. no. 31-5; AD-215 666.
Order from LC mi$2.40, ph$3.30 PB 146 283

An apparatus and a method were developed for quantitative evaluation of the relative abrasion resistance of vulcanizates to sandblast. A Hevea gum vulcanizate, and two Hevea vulcanizates containing 40 and 50 parts, respectively, of carbon blacks were tested by means of the apparatus. The gum vulcanizate exhibited a higher abrasion resistance than the two black-loaded vulcanizates. The abrasion resistances of all of the vulcanizates decreased as the impact angle of the abrasive was reduced.

Trionics Corp., Madison, Wis.
HEAT RESISTANT-ELASTOMERIC MATERIAL COMBINATIONS AND FORMS, by Robert E. Stapleton and James Pappis. Final rept. on Contract NOas-58-437-c. 30 Jan 59, 44p. 167 refs. AD-229 209.
Order from OTS $1.25 PB 161 813

Plasticizing of glass: A glass composition of 23.8% arsenic, 42.8% thallium and 33.4% sulfur, by weight, was prepared. A very plastic product was formed upon rapid or slow cooling of a heated composition of 60% sulfur and 40% glass. Centrifuging the product resulted in a brittle glass phase and a plastic sulfur phase. Irradiation polymerization of inorganic polymers: Phosphonitrilic chloride was prepared by the reaction of tetrachloroethane with phosphorus pentachloride and the polymerization of the resultant mixture of trimer and tetramer compounds by heat treatment. Phosphonitrilic chloride was very elastic below 300°C but gradually lost its elasticity and decomposed above this temperature. Ductile silver compounds: Rods and sheets of silver chloride were slowly bent through an angle of 90° without breaking. The ductility of the silver chloride appeared to decrease with time when the cast and pressed specimens were exposed to light after forming.

ALTERNATIVE SEQUENCES OF SAMPLING RATES FOR TIGHTENED MULTILEVEL CONTINUOUS SAMPLING PLANS, by Donald Guthrie and M. V. Johns, Jr. Technical rept. no. 36 on Contract N6onr-25126. 18 Feb 58, 29p. 3 refs.
Order from LC mi$2.70, ph$4.80 PB 138 268

The purpose of this report is to propose a new scheme for selecting the sequence of levels to be used in tightened multi-level continuous sampling plans of the type MLP-T given by Derman, Littauer, and Solomon (Annals of Mathematical Statistics, 28(1957)395-404). Certain advantages of the new levels are exhibited when k , the number of levels, is infinite and a criterion for comparison of the two schemes is proposed for the case of finite k . In addition, AOQ and AFI functions are given and contours of constant AOQL are plotted for the two schemes.

EXTENSIONS TO THEORY OF TIME SERIES ANALYSIS, by W. Freiberger. Quarterly rept. no. 5, 1 Aug-31 Oct 59, on Contract DA 36-039-sc-78130. [1959] 11p. 3 refs. AD-233 473.
Order from LC mi$2.40, ph$3.30 PB 147 414

The present study has concentrated on the case of a stochastic process where the sample values are uncorrelated (i.e., $Ex_\nu x_\mu = \sigma_{\nu\mu}$), with a flat spectral density. This would correspond either to white noise or to bandlimited noise with a correlation function $(\sin \pi t)/\pi t$, sampled at the zeros (i.e., $t = 1, 2, \ldots$).

Bureau of [Naval Weapons] Washington, D. C.
TABLE OF CIRCUMFERENCES AND AREAS. 21 Mar 47, 103p. NAVORD OD. 5797.
Order from LC mi$5.70, ph$16.80 PB 148 651

The computations are based on the value of π to eight significant figures, with a partial adjustment for the rounding error in π. The tabulated values of the Circumference and Area are in error by at most one unit in the last place. (Author)

California U. [Berkeley].
SYSTEMS OF DIFFERENTIAL FORMS, INCLUDING KURANISHI'S THEORY OF TOTAL PROLONGATIONS, by Harold H. Johnson. Technical rept. no. 2 on Contract DA 04-200-ORD-456. [1953] 84p. 6 refs. OOR rept. no. 1503.2; AD-138 694.
Order from LC mi$4.80, ph$13.80 PB 147 859

E. Cartan's theory of differential forms and their integral manifolds is outlined. Systems of differential forms are studied on a real analytic n-dimensional abstract manifold V. All the results are local so an assumption is made that V is a ball in Euclidean n-space. The fundamental concepts, which include contact elements, systems of differential forms, polar equations, independent variables, and prolongations, are explained. The Cartan-Kähler theorem and the Cauchy-Kowalewski theorem, and the systems in involution are discussed. An exposition of Kuranishi's theory of prolongation is presented in detail.

Carnegie Inst. of Tech., Pittsburgh, Pa.
AN EXTENSION OF THE CONCEPT OF THE MINIMUM IN CALCULUS, AND THE CALCULUS OF VARIATIONS, by A. Bomberault and E. Saibel. Technical rept. no 9 on Contract DA 36-061-ORD-495. [1952] 28p. 8 refs. CIT-ORD-15A-TR7; OOR rept. no. 1156.11; AD-155 100.
Order from LC mi$2.70, ph$4.80 PB 147 864

Analogs to the minimum problem of the calculus and calculus of variations are stated which may have use in describing interacting physical systems. The authors obtain necessary conditions that such generalized minima, which are called "polyminima", exist. Existence theorems which depend strongly upon fixed point theorems are also proved. Approximation methods corresponding to Rayleigh Ritz and finite difference methods are suggested. Plans are being made to give an application of the theory developed here to a physical problem. INVESTIGATIONS IN ABSTRACT ANALYSIS, by Irving E. Segal. Final rept. on Contract N6ori-02053. [1959] 4p. 13 refs. AD-225 006.
Order from LC mi$1.80, ph$1.80 PB 147 700

The project has been generally oriented towards the mathematical formulation of quantum field and elementary particle theory, and related purely mathematical questions in operator theory, harmonic analysis, and the theory of functional integration.

Chicago U., Ill.
SEMI-SIMILARITY INVARIANTS FOR SPECTRAL OPERATORS ON HILBERT SPACE, by Alvin N. Feldzamen. Technical note no. 1 on Contract AF 49(638)693. May 60, 78p. 34 refs. AFOSR TN-60-506.
Order from LC mi$4.50, ph$12.30 PB 148 091

This report presents in detail the beginnings of an equivalence theory for operators on Hilbert and Banach spaces patterned after a complete finite-dimensional theory.

[Columbia U., New York.]
A CLASS OF SMOOTH BUNDLES OVER A MANIFOLD, by James Eells, Jr. [Rept. on Contract Nonr-266(57).] [1959] 22p. 10 refs.
Order from LC mi$2.70, ph$4.80 PB 147 702

This paper illustrates certain constructions of importance in the geometry of smooth manifolds. It is proved that a homogeneous space B of a connected Lie group G can always be represented as a homogeneous space of a contractible Lie group E, necessarily of infinite demension in general. An examination is made of relations between the Lie algebra of G and that of E (this latter being a Banach-Lie algebra), in case G is compact and semi-simple.

Columbia U., New York.
THE CONTENT OF A DAM AS THE SUPREMUM OF AN INFINITELY DIVISIBLE PROCESS, by J. Gani and R. Pyke. Rept. on Contract Nonr-266(59). [1959] 23p. 16 refs. CU-7-59-Nonr-266(59)MS; AD-219 929.
Order from LC mi$2.70, ph$4.80 PB 147 693

The relation is discussed between the content of a dam and the supremum of a certain infinitely divisible process. The fact is pointed out that the distribution functions of the supremum over time $0 \leq t \leq T$ of a Poisson process with shift, and the content at time T of a dam with Poisson inputs and a constant release rate have identical forms. The backward Kolmogorov equation of the first process is shown to be identical with the forward equation of the second. A closer relation between the 2 processes is proved to exist, and a new definition for dam processes in discrete time is given. This is generalized to dam processes in continuous time whose net inputs are from a wide class of infinitely divisible processes. The distribution function of the total time during which such dams are empty and non-empty is found. A simplification of the double Laplace transform is obtained for the distribution function of the supremum over $0 \leq t \leq T$ of certain infinitely divisible processes with positive jumps. (Author)

A MINIMAX TEST OF FIT, by Lionel Weiss. Rept. on Contract [Nonr-266(04)]. [1959] 15p. 2 refs.
Order from LC mi$2.40, ph$3.30 PB 146 050

Two things are noted, first, limiting attention to the class of density functions which consist of horizontal line segments is not too great a restriction, since any density function satisfying mild regularity conditions can be arbitrarily closely approximated by a density function in our class. Second, our definition of distance is a rather peculiar one. Its purpose is to guarantee that the alternatives to the hypothesis differ from the uniform density function over a long enough interval to give us some chance of detecting the difference.

Georgia U., Athens.
CENTRALLY TRUNCATED SAMPLES FROM A NORMAL DISTRIBUTION, by A. Clifford Cohen, Jr. Final rept. for 1 Oct 52-31 Dec 58 on Estimation from Restricted Samples, Contracts DA 01-009-ORD-288 and DA 01-009-ORD-463. 15 Jan 59, 12p. 18 refs. AD 212 023.
Order from LC mi$2.40, ph$3.30 PB 147 871

An investigation is presented concerning the maximum likelihood estimation of the mean μ and the standard deviation σ of a complete normal distribution for which the probability density function is $f(x) = (\sigma\sqrt{2\pi})^{-1} \exp -(x-\mu)^2/2\sigma^2$, $-\infty \quad x \infty$, when samples are centrally truncated (when they are selected only from the remainder of the distribution after removal of the center section). Estimators are derived using the procedures of singly and doubly truncated samples.

Hebrew U. (Israel).
THE PRODUCT OF SUMMABILITY METHODS: NEW CLASSES OF TRANSFORMATIONS AND THEIR PROPERTIES, by Amnon Jakimovski. Technical Scientific note [no. 2, pt. 2] on Contract AF 61(052)187. Aug 59, 77p. 20 refs. AFOSR-TN-59-816; AD-232 071. AD-232 071.
Order from LC mi$4.50, ph$12.30 PB 146 101

Two new classes of transformation, which might be looked upon, respectively, as the sequence-to-function analogues to the generalized (and quasi-) Hausdorff transformations are defined and investigated. (Author)

A MEASURE OF ASYMMETRY FOR CONVEX SURFACES, by E. Asplund, G. Bredon and B. Grünbaum. Rept. on Contract AF 49(638)253. Apr 60, 4p. 2 refs. AFOSR-TN-60-403.
Order from LC mi$1.80, ph$1.80 PB 147 518

Generalizing results of G. v. Sz. Nagy it is proved that the surface centroid of any convex body K in E^n, $n \geq 2$, divides the distance between any pair of parallel supporting hyperplanes of K in ratio less than 2n-1, this being the best possible bound. (Author)

Institute for Advanced Study, Princeton, N. J.
ON A MEASURE OF ASYMMETRY OF CONVEX BODIES, by E. Asplund E. Grosswald, and B. Grünbaum. Rept. on Contract AF 49(638)253. Mar 60, 7p. 9 refs. AFOSR-TN-60-359.
Order from LC mi$1.80, ph$1.80 PB 147 516

A new measure of asymmetry of convex bodies in Euclidean spaces is defined and some of its properties established. As far as is known, this is the first measure according to which the n-dimensional simplex is not the most asymmetric n-dimensional convex body for $n \geq 3$. (Author)

A SPECIAL HILL'S EQUATION WITH DISCONTINUOUS COEFFICIENTS, by Harry Hochstadt. Rept. on Contract AF 49(638)229. Mar 60, 19p. 5 refs. Research rept. no. BR-32; AFOSR-TN-60-322.
Order from LC mi$2.40, ph$3.30 PB 147 560

The equation
$y'' + \lambda^2 \rho(x) y = 0$
$\rho(x) = 1 \qquad |x| \leq 1$
$= a^2 \qquad 1 < |x| < L$
is investigated. $\rho(x)$ is taken as a periodic function of period 2L and defined as above in the interval (-L, L). The nature of the characteristic values λ for which the equation has solutions of period L and 2L is investigated. Stability charts are drawn showing for which values of a^2 and λ all solutions are bounded, and for which some solutions are not bounded. (Author)

A TABLE OF PROBABILITY DISTRIBUTIONS USEFUL IN WAR GAMES AND OTHER COMPETITIVE SITUATIONS, by H. L. Toothman. Final rept. 16 May 60, 92p. 1 ref. NRL rept. no. 5480.
Order from LC mi$5.40, ph$15.30 PB 145 721

A formula for a probability distribution has been computed and tabulated by a digital computer in terms of its four arguments. The formula gives the probability

of t successes, if each of m players making r successive plays has probability p_1 of success in each play, and probability of p_2 of being eliminated from subsequent play. The argument p_1 ranges from .01 to .95, p_2 ranges from .00 to .90, and m and r range from 1 to 4. The competitive situation can also be described in terms of a random walk on three points with two absorbing barriers.

THE ABSOLUTE CONVERGENCE OF CERTAIN LACUNARY FOURIER SERIES, by Siobhan O'Shea. Technical note no. 6 on Contract AF 61(514)1399. [1956] 13p. 2 refs. AFOSR-TN-59-883; AD-226 388.
Order from LC mi$2.40, ph$3.30 PB 146 100

Let f(x) be measureable and periodic with period 2π, and satisfy a uniform Lipschitz condition of order $\alpha(0<\alpha\leq 1)$ in every finite interval. Let the Fourier series of f be $\frac{1}{2}a_0 + \sum_1^\infty (a_n \cos nx + b_n \sin nx)$. Results for the cases $0<\alpha\leq\frac{1}{2}$ are interpolated between the following 2 theorems: (1) if $\alpha>\frac{1}{2}$, then $\sum (|a_n|+|b_n|)<\infty$; and (2) if $\alpha=0$ and $a_n=b_n=0$ except possibly for $n=n_k$, where $\{n_k\}$ is a sequence of positive integers satisfying $\liminf_{k\to\infty} \frac{n_{k+1}}{n_k} > 1$, then $\sum (|a_n|+|b_n|)<\infty$ is true.

TWO-WAY RANK-SUM TESTS FOR DISPERSIONS, by A. R. Ansari and R. A. Bradley. Technical rept. no. 9 on Development of Statistical Methods for Experimental Designs in Quality Control and Surveillance Testing, Contract Nonr-2352(01). Aug 59, 31p. 14 refs. AD-225 593.
Order from LC mi$3.00, ph$6.30 PB 148 190

Non-parametric 2-sample tests are investigated on dispersions. X- and Y-samples of m and n independent observations are considered from population with continuous cumulative distribution functions F(u) and G(u). For the basic test, the difference in locations of the 2 populations are known and the 2 samples are adjusted to have equal locations. Taking these location parameters to be zero, the hypothesis $G(u)\equiv F(u)$ is tested against alternative of the form $G(u)\equiv F(\Theta u)$, where $\Theta\neq 1$. The 2 samples are ordered in a single joint array, and ranks are assigned from each end of the joint array towards the middle. The statistic used is W, the sum of ranks for the X-sample. The distribution of W is studied, the first 4 moments of W are developed, a normal approximation to the null distribution of W is devised, and large-sample properties of the W-test are considered. Other non-parametric tests of dispersions are reviewed. A modified test is suggested where the difference in population locations is not known. Its properties are investigated for a limited sampling study. The study indicates there is no great difference in the moments of W for either test.

EXPLICIT PERTURBATION FORMULAE AND CONVERGENCE THEOREMS, by F. H. Brownell. [Rept. on Contract Nonr-477(20)]. [1958] 28p. 4 refs. AD-214 098.
Order from LC mi$2.70, ph$4.80 PB 146 295

Perturbation theory is developed for a λ in the point spectrum with finite multiplicity m of a Banach or Hilbert space linear operator by giving explicit formulas for the eigenvalue and the eigenvector series covering all possible splitting cases. The convergence of these series is proved by using majorants, and error estimates are given under suitable boundedness assumptions for a few special splitting cases. These arguments can be carried over to any given splitting case. An example is given of a nonisolated λ_0 for which the boundedness and other assumptions hold.

ON AXIOMATIC APPROACH TO HOMOLOGY THEORY WITHOUT USING THE RELATIVE GROUPS, by Sze-Tsen Hu. Technical note no. 8 on Contract AF 49(638)179. Apr 60, 18p. 5 refs. AFOSR-TN-60-371.
Order from LC mi$2.40, ph$3.30 PB 148 023

Recently, D. Puppe proposed a new axiomatic approach to homology theory without using the relative groups. Since he used a base point in each space throughout his approach, he can prove the uniqueness theorem only for connected CW-complexes. In the present note, Puppe's axiomatic approach is improved by removing the base point. After the base point has been removed from the theory, it turns out that the uniqueness theorem can be proved for all CW-complexes. (Author)

ALGEBRAS OF LINEAR TRANSFORMATIONS, by R. Creighton Buck. Technical rept. no. 4 on Representation and Characterization Problems for Analytic Functions, Contract DA 11-022-ORD-1851. Nov 56, 20p. 6 refs. OOR rept. 1406.4M.
Order from LC mi$2.40, ph$3.30 PB 138 139

One definition of harmonic analysis is that it is the study of a group in terms of the function spaces defined on it. In the present paper, he shall describe a general approach which is based upon a shift in the point of view, accompanied by an elaboration of the underlying structure.

Wisconsin U., Madison.
FUNCTIONS OF RESTRICTED VARIATION, by Preston G. Hammer. Technical rept. no. 8 on Studies in Numerical Analysis, Contract DA 11-022-ORD-2301. Mar 58, 26p. 15 refs. OOR rept. no. 1626.9; AD-137 081.
Order from LC mi$2.70, ph$4.80 PB 147 870

A detailed analysis is made of the oscillations or real-valued functions defined on a simply ordered set. A new class of functions, those of restricted variation, is singled out which include the class of functions of bounded variation. The concept of a function of restricted variation is a generalization of the concept of a Cauchy sequence. The concept of the k-variations of functions is introduced. This concept is derived from the restriction of the number of points in a partition to a most k and is essential to the definition of the restrictedness of variation. The syntonicity of function pairs is defined in order to obtain necessary and sufficient conditions that the total variation of a sum of two functions is the sum of their total variations. The syntonicity concept is required to obtain the full converse to the theorem giving the usual decomposition of a function of bounded variation.

PLASTIC NEURONS AS MEMORY ELEMENTS, by D. G. Willis. Technical rept. June 59, 29p. 14 refs. LMSD-48432-1; AD-219 839; Supersedes LMSD-48432; AD-217 265.
Order from LC mi$2.70, ph$4.80 PB 147 670

A study was conducted that defines precisely a class of plastic neuron models, determines their information storage capacity, and shows the mechanism by which information can be read into and out of a system of such neurons on a random access basis. The neuron model investigated has an arbitrary number n of input leads and one output lead. At any time step the ith input lead will have some synaptic value s_i associated with it, and will be carrying some signal e_i, which is either 1 or 0 (firing or not firing). The neuron will fire and produce a 1 signal on its output lead if, at the previous time step, $\sum_n e_i s_i \geq T$ where T is some threshold value. The synaptic value s_i will increase, decrease, or remain unchanged at each time step depending upon the firing condition of the neuron and the signal just carried by the ith lead. The storage capacity of this neuron model is determined principally by the long term stability of the s values, and for any reasonable number of inputs appears to be compatible with the requirements for human memory. Two demonstrations are presented showing the read-in-read-out properties of a system of 288 plastic neurons simulated on a digital computer. An expression is derived for the output of a plastic neuron as a function of its previous history. (Author)

DESIGN OF A SAMPLED DATA CONTROLLER USING TRANSISTOR LOGIC, by M. Cavestany. Rept. on Contract Nonr-225(24). 13 Aug 59, 51p. 9 refs. Technical rept. no. 2100-1; AD-225 011.
Order from LC mi$3.60, ph$9.30 PB 147 692

The design and construction of a digital controller for use in the study of sampled-data control systems is discussed. The device is a hybrid computer combining digital and analog techniques to take advantage of the special properties of each. The device was designed to permit the introduction of a digital controller in an analog computer simulation which would be simpler and more flexible to use than is possible with conventional analog or digital components alone. Analog methods are used to produce sums and products, and digital methods are used to store the samples of data. A novel feature of this controller is the use of special modulators to convert the analog voltages to frequency information which is the form in which the data is

stored on a magnetic drum. An exposition of the principles of digital compensation in sampled-data systems is made, and the different steps leading to the conception and utilization of a digital controller are covered. The system is based on the utilization of a magnetic drum as data hold, storage, and delay element, with transistor digital logic circuits to perform the necessary switching. (Author)

ON THE VIBRATION OF THERMALLY STRESSED PLATES IN THE PRE-BUCKLING AND POST-BUCKLING STATES, by Yechiel Shulman. Rept. on Contract Nonr-1841(22). Jan 58, 53p. 8 refs. Technical rept. 25-25.
Order from LC mi$3.60, ph$9.30 PB 138 252

The free vibration characteristics of thermally stressed plates have been obtained in the pre-buckling and post-buckling states. The results are valid for uniformly heated plates with two opposite edges simply supported and with generalized support conditions on the other two edges. A numerical example has been worked out.

Aeroelastic and Structures Research Lab., Mass. Inst. of Tech., Cambridge.
RESEARCH PROGRAM ON STRUCTURAL DYNAMICS AND THERMO ELASTICITY PROBLEMS, by T. H. H. Pian. Summary rept. on Contract Nonr-1841(22). Jan 58, 18p. 31 refs. Technical rept. 25-27.
Order from LC mi$2.40, ph$3.30 PB 138 251

The initial phase of the program consisted only of problems related to responses of structures to shock and impact. Since September 1952, the problem of transient stresses due to aerodynamic heating was added to the research program. During the last year the field of study has been limited only to problems related to structure under thermal environment.

American Machine and Foundry Co., Alexandria, Va.
ULTRA-SHORT-TIME CREEP RUPTURE EQUIPMENT MANUAL, by Joseph S. Ives, Jr. Rept. for 1 Mar 58-31 Mar 59 on Materials Applications, Contract AF 33(616)5557. Apr 60, 52p. WADC Technical rept. 59-762, Pt. I.
Order from OTS $1.50 PB 161 789

The purpose of this program was to develop a method of heating a sample of sheet metal to a pre-determined temperature in a short period of time and to measure the creep characteristics of this material at the developed temperature. Described in this report are the special equipments designed to carry out the work together with the necessary operating instructions. Also included are the drawings required to produce the equipment at the contractor's facilities. (Author)

THE LOAD-CARRYING CAPACITY OF WIDE BEAMS AT FINITE DEFLECTIONS, by R. M. Haythornthwaite and W. E. Boyce. Technical rept. no. 32 on Contract Nonr-562(10). Feb 58, 30p. 10 refs. C11-32.
Order from LC mi$2.70, ph$4.80 PB 138 131

Estimates of the post-yield carrying capacity of laterally loaded plates may be obtained conveniently from the velocity fields associated with either the limit load or the membrane solution. The latter can be used even when the limit load is not known. As an illustration, an approximate membrane solution is found for a centrally loaded rectangular plate, rigidly clamped along two opposite sides and free along the other two. The velocity field includes both a local circular symmetric deformation near the load and also a general beam bending mechanism. The rate of deflection is computed and the field is also used to obtain an upper bound to the limit load. Comparison is made with the results of tests of six steel beams of various widths. (Author)

Illinois Inst. of Tech., Chicago.
PLASTIC ANALYSIS OF CIRCULAR CONICAL SHELLS, by Philip G. Hodge, Jr. Rept. on Contract Nonr-1406(04). Aug 59, 25p. 6 refs. DOMIIT rept. no. 1-8.
Order from LC mi$2.70, ph$4.80 PB 147 724

A right circular conical shell of edge angle α is subjected to a concentrated load Q directed along the axis. The collapse load is found to be $Q = 2\pi M_0 \cos^2 \alpha$, independently of the size or support conditions of the shell. Some solutions are also obtained for the case where the load is distributed over a finite area. Bounds are found on the collapse load of a general rotationally symmetric shell under a concentrated load. (Author)

Israel Inst. of Tech., Haifa.
BUCKLING OF CONICAL SHELLS UNDER EXTERNAL PRESSURE AND THERMAL STRESSES, by Nicholas J. Hoff (Stanford U.) and Josef Singer. Technical final rept. on Contract AF 61(052)123. Dec 59, 83p. 21 refs. AFOSR-TR-59-203.
Order from LC mi$4.80, ph$13.80 PB 147 497

Simplified differential equations governing the deformations of deep thin circular conical shells subjected to arbitrary loads and arbitrary temperature distributions are derived by the principle of the minimum total potential energy. The equations reduce to Donnell's equations (extended to include an arbitrary

temperature distribution) when the cone angle approaches zero. An asymptotic solution of these simplified equations is obtained for a truncated conical shell subjected to an axisymmetrical temperature distribution. The equations are extended to include problems of elastic stability.

Lockheed Aircraft Corp., Sunnyvale, Calif.
BUCKLING OF A CYLINDRICAL SHELL SUBJECTED TO A SADDLE-TYPE LOAD, by B. O. Almroth. Apr 60, 37p. LMSD-288 242.
Order from LC mi$3.00, ph$6.30 PB 148 078

This report presents a buckling analysis for a circular cylindrical shell subjected to external lateral pressure over a portion of the cylinder length. The results are useful for determining allowable loads in motor cases and other thin-walled structures during handling and storage. The method uses a stability criterion based on the principle of minimum potential energy. The Rayleigh-Ritz procedure is used to expand the displacement components in trigonometric series.

Materials Lab., Wright Air Development Div., Wright-Patterson AFB, Ohio.
CYLINDRICAL SANDWICH CONSTRUCTION DESIGN, by Sidney Allinikov. Rept. on Materials Application. Feb 60, 277p. 14 refs. WADD Technical rept. 60-133.
Order from OTS $4.00 PB 161 793

This report is a compilation of papers which present a comprehensive treatment of the theories and parameters associated with the design of cylindrical sandwich constructions. Many of the formulas developed are applicable to a wide variety of core and facing combinations. Experimental data on flat and curved sandwich sections are furnished to support the theoretical solutions related to the design of these structures. (Author)

EXPERIMENTAL MEASUREMENT OF MECHANICAL IMPEDANCE, by J. W. Young, Jr. and R. O. Belsheim. 24 May 60, 25p. 9 refs. NRL rept. 5458.
Order from LC mi$2.70, ph$4.80 PB 144 639

A mechanical impedance head and measuring system for experimentally determining mechanical impedance are described, following a brief review of the basic concepts. The system incorporates commercially available equipment for excitation, observation, and analysis of measurements. In order to check the measuring techniques, and to gain experience in the use of the equipment, solid blocks as well as a realistic structure were tested. The results for the various size blocks and for the structure were compared with the expected theoretical results. It is concluded that the system could be used to measure mechanical impedance over a frequency range of 10 to 500 cps. A flaw in the present system is that point-by-point measurements are required, whereas continuous measurements over the frequency range are essential for extensive measurements. The necessary revisions are feasible. (Author)

Stanford Research Inst., Stanford U., Calif.
ATTENUATION OF THE SHOCK WAVE PRODUCED IN A SOLID BY A FLYING PLATE, by G. R. Fowles. Rept. on Contract AF 49(638)625. 20 Aug 59, 30p. 11 refs. SRI Project GU-2912; AFOSR-TN-59-1281.
Order from LC mi$2.70, ph$4.80 PB 147 684

The attenuation of the plane shock wave produced in a solid by a flying plate of the same material is treated neglecting dissipative processes and effects of material rigidity. Explicit formulas for the position of the shock front and the shape of the pulse as functions of time are obtained by application of Friedrich's method. A numerical example for an aluminum target and projectile is presented to illustrate some of the features of the calculation, and an experiment is proposed to test the theory. The experiment should also allow a reasonably precise measurement of sound velocity immediately behind the shock front to be obtained. This possibility applies equally well to the case of target and projectile of different materials. (Author)

Watertown Arsenal Labs., Mass.
A CONCEPT OF FATIGUE DAMAGE, by Joseph I. Bluhm. June 58, 20p. 24 refs. WAL Technical rept. 893/202; AD-162 567.
Order from LC mi$2.40, ph$3.30 PB 148 053

The behavior of a simple conventional model of material subjected to fatigue is described and qualitatively related to the magnitude of loads. This is shown to lead to a quantitative damage concept for fatigue based upon the absolute strain in excess of the current endurance limit. This is distinct from previous suggestions for damage based upon the plastic strain. The latter criterion is shown to fail for the low stress level at which plastic flow is known to occur. (Author)

Watertown Arsenal Labs., Mass.
STRESS ANALYSIS OF A THIN STRIP CONTAINING A LARGE HOLE, by E. W. Ross, Jr. Apr 60, 52p. 3 refs. Technical rept. WAL TR 811.8/1.
Order from LC mi$3.60, ph$9.30 PB 146 163

This report treats the problem of finding the elastic strain and stress distribution around a hole in a thin strip under uniaxial tension. The hole is assumed to have two axes of symmetry, parallel and perpendicular to the direction of the applied force, and to be centrally located. In particular, a method is given for finding the limiting stress and strain distribution near the minimum sections (and so the maximum stress-concentration factors) as the hole width approaches the strip width. SIMILARITY LAWS REQUIRED FOR EXPERIMENTAL AEROTHERMOELASTIC STUDIES, by John M. Calligeros and John Dugundji. Rept. on Contract Nonr-1841(46). May 59, 82p. 28 refs. Technical rept. 75-1; AD-219 760.
Order from LC mi$4.80, ph$13.80 PB 146 102

The similarity laws for the study of aeroelastic phenomena in the presence of aerodynamic heating are derived. The parameters for the general aerothermoelastic problem are obtained by nondimensionalizing the governing equations relating to the external aerodynamic flow, heat conduction to the interior of the structure, and the thermal stresses and external loads applied to the structure. The investigation is limited to moderate temperatures (below about 1000°F-i.e., $M \leq 3.5$) and considers only elastic behavior of the material. Certain conflicts inherent in the general problem permit similarity only for length-scale ratios of 1. The primary conflict is found to be between the free stream Reynolds number Re, Mach number M, and the basic aeroelastic parameter $\bar{P}\mu/Eo$. Three methods of dealing with this basic conflict are presented, and in each case the importance of the similarity parameters is discussed. (Author)

AN INVESTIGATION OF THE MODEL BLOCKAGE FOR WIND TUNNELS AT MACH NUMBERS 1.5 TO 19.5, by C. J. Schueler. Rept. on ARO, Inc., Contract AF 40(600)800. Feb 60, 19p. 5 refs. AEDC-TN-59-165; AD-232 492.
Order from LC mi$2.40, ph$3.30 PB 146 115

An experimental investigation of the test section flow blockage characteristics was conducted in the 12- x 12-in. supersonic wind tunnel. The purpose of the tests was to determine whether a method of predicting the maximum size model which will permit the establishment of supersonic flow, based on the model frontal area and bow shockwave strength, is applicable over a wide range of Mach numbers. The tests were conducted over the Mach number range from 1.5 to 5 using test models consisting of 15°, 20°, and 28° half-angle cones, cone-cylinder combinations, and a series of discs. The inadequacy of the one dimensional, normal shock theory for predicting allowable model sizes was reconfirmed. A correlation based on shock wave strength and model frontal area was found to be suitable only over a limited range of Mach numbers. Permissible hemisphere-cylinder model sizes from several wind tunnels covering the Mach number range from 1.5 to 19.5 are also presented. (Author)

Arnold Engineering Development Center, Tullahoma, Tenn.
ON BASE PRESSURES AT HIGH REYNOLDS NUMBERS AND HYPERSONIC MACH NUMBERS, by Jack D. Whitfield and J. Leith Potter. Rept. on ARO, Inc., Contract AF 40(600)800. Mar 60, 21p. 3 refs. AEDC TN-60-61; AD-234 477.
Order from LC mi$2.70, ph$4.80 PB 146 332

A tentative method for estimating base pressures at hypersonic Mach numbers and at large Reynolds numbers is described. Both blunt and sharp nosed shapes are treated. The procedure is based on existing empirical methods but modifications are made in order to deal with short, blunt bodies. A tendency for base pressure ratios on conical or other flared bodies to increase with Mach number in the hypersonic regime is illustrated. This trend is dependent on body shape and is strengthened by nose bluntness. Refinement and definition of the limitations on the method must await the receipt of experimental data covering a greater range of variables. (Author)

Arnold Engineering Development Center [Tullahoma, Tenn.]
TESTING TECHNIQUE USED FOR FLUTTER TESTS OF MIT SEMI-SPAN WING MODELS AT SUPERSONIC SPEEDS, by L. K. Ward. Rept. on ARO, Inc., Contract AF 40(600)800. July 59, 13p. 2 refs. AEDC TN-59-74; AD-218 737.
Order from LC mi$2.40, ph$3.30 PB 147 600

A description of the testing technique used for flutter tests of cantilevered semi-span wings at high supersonic speeds is presented. Injecting the models into the airstream after the desired tunnel flow was established permitted testing of the necessarily low strength wings at high supersonic Mach numbers ($M = 1.5$ to 5.0). THERMO-ELASTIC EQUATIONS APPLICABLE TO THICK-WALL, POINTED SHELLS OF REVOLUTION, by R. D. Sutherland and R. G. Shook. Rept. on Contract AF 49(638)592. Nov 59, 31p. 4 refs. TM-349-14; AFOSR TN-59-1274; AD-233 395.
Order from LC mi$3.00, ph$6.30 PB 146 439

The thermo-elastic equations necessary to define the stress distribution in a thick-wall, pointed shell of revolution are presented. A coordinate system based on the classic ogive shape which is applicable to a variety of low aerodynamic drag shapes is utilized in

the analysis. Stress functions equations are derived in these ogive coordinates. Techniques are presented for use at the boundaries of the shells of revolution and at the axis of revolution. The equations presented can be solved by numerical methods and are a basis for further work in obtaining analytical solutions to the stresses in thick-wall, pointed shell of revolution. (Author)

ON THE TURBULENT BOUNDARY LAYER WITH FLUID INJECTION, by Donald L. Turcotte. Rept. on Contract AF 18(600)1523. July 59, 10p. 6 refs. AFOSR-TN-59-874.
Order from LC mi$1.80, ph$1.80 PB 147 634

By introducing a sublayer region in which the intensity of turbulence grows at a prescribed rate, the reduction in wall shear stress due to fluid injection is found for a turbulent boundary layer. With the decrease in wall shear stress expressed as a function of the ratio of the injection velocity to the friction velocity, the form of the solution is particularly simple. The theory provides a free parameter which can be determined such that the available experimental data are excellently correlated. (Author)

POTENTIAL FLOWS IN THE APPROXIMATION OF VISCOUS ACOUSTICS, by William Joseph Rae. Rept. on Contract AF 18(600)1523. June 60, 114p. 18 refs. AFOSR-TN-60-409.
Order from LC mi$6.00, ph$18.30 PB 147 644

Steady, irrotational flows are studied in a linearized approximation, retaining the effects of dispersion and attenuation due to viscosity in the region outside the boundary layer. The differential equation for the velocity potential in this approximation is derived and discussed, and formal solutions for the flow around non-lifting two-dimensional and axisymmetric bodies are found. Approximate evaluations of the formal solution then reveal that throughout all of the subsonic, and most of the supersonic flow field, the inviscid solution is altered by a correction that is first-order in a viscosity parameter. In the supersonic cases, the familiar inviscid wave pattern tends to be dispersed in the vicinity of the body, and at great distances from the body, all disturbances decay. The rates of decay of pressure disturbances at these distances are found, and their relation to the inviscid, nonlinear treatment of the same problem is discussed. In the course of the Fourier analysis of the problem, a Fourier transform which is not listed in any of the standard tables is evaluated, and this provides a closed-form solution to a boundary-value problem involving a certain third-order partial differential equation. Both of these results are thought to be new. (Author)

PRELIMINARY STUDIES ON BOUNDARY-LAYER TRANSITION CAUSED BY A THIN TRANSVERSE WIRE FLOATING FROM SURFACE, by Francis R. Hama. Rept. on Contract AF 49(638)645. Apr 60, 27p. 8 refs. Technical note BN-208; AFOSR-TN-60-505.
Order from LC mi$2.70, ph$4.80 PB 147 487

It is found that a thin wire, which is incapable of tripping the flow when it is attached to the surface, can cause transition if it is raised from the surface. A rough criterion of provoking transition at the wire is about 200 - 300 for the Reynolds number based upon the velocity at the top of the wire and the distance of the top of the wire from the surface, although it depends on the combination of the wire diameter and the raised distance from the surface. This criterion is approximately the same as that for the conventional trip wire attached to the surface. But a possible merit as a tripping device is that a thick wire is not required to block the entire height. The Reynolds number based upon the velocity at the top and the wire diameter can be as small as 75 to trip the flow at the wire. Important mechanics involved in this arrangement is the following: the flow underneath the wire tends to separate from the surface immediately behind the wire and to break up three-dimensionally resulting in the formation of longitudinal vortices. Transition is provoked by the coupling between the longitudinal vortices and the two-dimensional vortices formed behind the wire. (Author)

Institute of Engineering Research, U. of California, Berkeley.
THE SURFACE ABLATION OF FIBER REINFORCED PLASTICS PARALLEL TO AN OXYACETYLENE FLAME, by Robert B. Greene. Rept. on Contract DA 04-200-ORD-776. 25 Feb 60, 67p. 20 refs. Technical rept. HE-150-179; Series no. 128, issue no. 4.
Order from LC mi$3.90, ph$10.80 PB 148 008

The present study was initiated to provide some of the information required for selection and design of ablating heat shields at moderate heating rates. Specimens of twelve different fiber reinforced plastics were subjected to flat plate turbulent heating from an oxy-acetylene flame. It was found that when exposed to heating in the 20 to 40 BTU/ft^2 sec range, reinforced phenolic and melamine resins are subject to an unsteady state ablation process characterized by a charred layer of appreciable thickness. This charred layer was found to increase in thickness at a rate of 0.07 to 0.10 inches/min. The thermal diffusivities as a function of temperature were calculated from test data, and found to show a sharp decrease during the initial temperature rise. After the initial decrease the values of the diffusivities generally remained in a range of 0.4×10^{-6} to 2×10^{-6} ft^2/sec.

TABLE OF PRESSURE RATIOS P_i/P_c AND P_c/P_a vs. MACH NUMBER FOR A 15° RIGHT CIRCULAR SUPERSONIC CONE ($\gamma = 1.405$) by N. W. Spencer. Scientific rept. no. ES-3 on Contract AF 19(604)1948. Sep 58, 106p. 4 refs. 2597-7-S; AFCRC-TN-58-622.
Order from LC mi$5.70, ph$16.80 PB 137 829

This report presents a table of pressure ratios to be found on a 15° right circular cone tabulated versus the free-stream Mach number. The pressure ratios are given to five significant figures against 0.001 increments of the argument. The argument ranges from $M_1 = 1.048$ to $M_2 = 3.895$. Given are the ratio of total head pressure (P_i) to the cone-surface pressure (P_c) and the ratio of the cone-surface pressure (P_c) to the free-stream static pressure (P_a). With these tables and two pressures on a right circular cone, it is possible to determine the free-stream Mach number and the free-stream static pressure. By measuring the free-stream velocity (or the velocity of the cone throught the media if that is the situation) in addition, it is possible to compute free-stream static temperatures and densities. OPTICAL BIREFRINGENCE INDUCED BY SHEAR WAVE PROPAGATION IN AQUEOUS MILLING YELLOW SOLUTIONS, by George B. Thurston, Logan E. Hargrove, Jr. and Marvin Y. Edmison. Technical rept. no. 4 on Research in Nonlinear Properties of Fluid Flow Through Circular Orifices, Contract DA 23-072-ORD-583. June 57, 74p. 27 refs. OOR rept. no. 1336.4; AD-135 029.
Order from LC mi$4.50, ph$12.30 PB 147 857

The optical interference patterns observed in a flow-birefringent fluid when viewed between crossed plane-polarizing plates are related to the fluid motion. This work is a study of the observed optical interference patterns caused by an oscillating plane in a flow-birefringent fluid, an aqueous solution of milling yellow dye. Optical and hydrodynamic theory is reviewed and experimental methods and results are presented. It is found that the optical interference patterns exhibit wave properties which are related to the wave of transverse fluid vibrations. Properties of the optical interference patterns are presented as a function of phase, velocity amplitude, and frequency. The effects of geometry of flow facility, optical system alignment, and edge effects are discussed. Consideration is given the optical and rheological properties of the fluid. (Author)

ANALYTIC SOLUTIONS OF PLANAR REENTRY TRAJECTORIES WITH LIFT AND DRAG, by Kenneth Wang and Lu Ting. Rept. on Contract AF 49(638)445. Apr 60, 75p. 7 refs. PIBAL rept. no. 601; AFOSR-TN-60-508.
Order from LC mi$4.50, ph$12.30 PB 148 088

The method of Lees, Hartwig, and Cohen is modified, so that the gravitational and the centrifugal terms in the equation of motion normal to the trajectory can be retained. Analytic solutions for planar shallow reentry trajectories are obtained. For constant lift and drag coefficients, algebraic relationship between the local inclination and the density or elevation and that between the velocity and density are obtained. The first relationship is independent of the drag coefficient; therefore the result of the first relationship can be tabulated for various values of lift coefficient only. If the lift and drag coefficients are given functions of elevation, similar analytic relationships can be obtained by simple quadratures. The analytic solutions are employed to determine the acceleration, in particular the maximum acceleration, along the trajectory. As applied to the skip trajectories, the minimum elevation and the exit condition of each skip are determined. (Author)

THE UNSTEADY LAMINAR BOUNDARY LAYER ON A FLAT PLATE, by Sin-I Cheng and David Elliott. Rept. on Contract AF 18(600)498. Sep 55, 103p. 16 refs. Princeton rept. no. 318; AFOSR TN-56-115; AD-82 511.
Order from LC mi$5.70, ph$16.80 PB 148 037

The unsteady laminar boundary layer on a flat plate moving with an arbitrary velocity $U_\infty(t)$ into an in-

compressible fluid at rest has been investigated in this paper. The motion is taken to start from rest at a time $t = 0$ with $U_\infty(t)$ continuous at $t = 0$ and infinitely differentiable for all $t > 0$. Under these conditions a solution is constructed which is valid for all t and x, where x is the distance from the leading edge of the plate. The solution is also shown to be valid for the flow after a long time when $U_\infty(t)$ does not satisfy the above conditions. Finally, the effect of compressibility for small Mach numbers has been discussed briefly. (Author)

SOME EFFECTS OF SURFACE CURVATURE ON THE LAMINAR BOUNDARY LAYER FLOW, by K. Toba. Rept. on Contract AF 49(638)23. Mar 60, 28p. 5 refs. TR AE 5904; AFOSR-TN-60-448.
Order from LC mi$2.70, ph$4.80 PB 147 754

In a recent report (PB 136 251) K. T. Yen presented a new theory of laminar boundary layer flow. By adopting the natural coordinates the boundary layer approximation is made so that surface curvature effects are taken into account. In this report, further elaboration of the proposed formulation is made and the effects of surface curvature are evaluated for a family of surfaces which yield similar solutions. Numerical results for the velocity profiles and the wall skin friction distribution obtained by means of a high speed computer are presented and analyzed. (Author)

LAMINAR SEPARATION IN SUPERSONIC FLOW WITH EMPHASIS ON THREE-DIMENSIONAL PERTURBATIONS AT REATTACHMENT, by Jean J. Ginoux. Final rept. on Contract AF 61(514)993. Feb 60, 44p. 7 refs. TCEA Technical note 3; AFOSR-TN-60-237.
Order from LC mi$3.30, ph$7.80 PB 147 503

Regular and repeatable span-wise flow perturbations exist in the reattachment region of a laminar supersonic boundary-layer on a two-dimensional backward-facing step model. The model span and leading-edge thickness, when below 0.1 mm, had no effect on the wave-length of the flow perturbations. On backward facing-steps, at a Mach number of 2.16, the ratio of wave-length of the flow perturbations to boundary-layer thickness was a function of the ratio of step-height to boundary-layer thickness. Similar perturbations were found at the reattachment region of a laminar boundary-layer on forward-facing steps, on compression-corners, on rectangular cavities and in the case of interaction between a shock-wave and the boundary-layer. They were also detected in unseparated boundary-layers. The presence of three-dimensional perturbations seems to be related to the general question of boundary-layer stability. (Author)

OBSERVATIONS ON BUBBLE GROWTHS IN VARIOUS SUPERHEATED LIQUIDS, by Paul Dergarabedian. Rept. on Contract N123s91875. 26 Jan 56, 19p. 5 refs. NAVORD rept. 5009.
Order from LC mi$2.40, ph$3.30 PB 148 378

Experimental data are presented for the growth of vapor bubbles in various superheated liquids, such as carbon tetrachloride, benzene, ethyl alcohol, and methyl alcohol. These data are compared with the theoretical results obtained by Plesset and Zwick who derived these results by taking into account the heat diffusion across the bubble boundary. The agreement in all cases between experiment and theory is found to be good. The growth of vapor bubbles in slightly superheated water is also presented in the form of experimental data for bubbles just beginning to grow from a point of equilibrium which is presumed to be dynamically unstable. The radii corresponding to the points of equilibrium are of the same order of magnitude as predicted by theoretical considerations. (Author)

A MODEL OF TURBULENCE DISPLAYING AUTONOMOUS OSCILLATIONS, by R. J. Dickson. Technical memo. 25 Mar 59, 24p. 4 refs. LMSD-48466.
Order from LC mi$2.70, ph$4.80 PB 147 671

This report presents the results of the attempt to find and treat simplified examples of problems governed by nonlinear space-time systems. The introduction sketches the general setting of a "Model of Turbulence" in the sense of J. M. Burgers, and directs attention to the character of the particular problem considered here. Section 2 introduces a special class of nonlinear ordinary differential equations and explains its relationship to a partial differential system studied by Burgers. Section 3 takes the first step in a detailed study of this class of equations.

INTERNAL FRICTION OF FeAl ALLOYS DUE TO SOLUTE ATOM PAIRS. REMARKS ON THE THEORY OF THE EFFECT, by Guiseppe Biorci, Andrea Ferro, and Giorgio Montalenti. Technical note 4a on Contract AF 61(514)1331. Jan 60, 56p. 42 refs. AFOSR-TN-60-495.
Order from LC mi$3.60, ph$9.30 PB 147 501

The internal friction due to directional short range order in Fe Al alloys has been studied. At the frequency of about 1 cps the effect appears at about 510°C with a relaxation time corresponding to a process of substitutional diffusion. The intensity of the effect increases rapidly for concentrations above 10%, and then drops to low values in the region of Fe_3 Al, where the order occurs. Hence the curve of the intensity of the effect as a function of concentration is, with fairly good agreement, proportional to the number of solute Al pairs, as deduced from X rays results of Bradley and Jay. However some deviation from ideality seems to be present also at low concentrations. (Author)

SELF-DIFFUSION OF IRON AND SULFUR IN FERROUS SULFIDE, by Ralph H. Condit and C. Birchenall. Rept. on Contract AF 49(638)533. Mar 60, 126p. 67 refs. Metallurgy rept. no. 24; AFOSR-TN-60-245.
Order from LC mi$6.30, ph$19.80 PB 147 772

Measurements of the self-diffusion of iron and sulfur in ferrous sulfide single crystals are reported as a function of temperature, deviation from stoichiometric composition, and crystallographic direction. Iron self-diffusion is primarily by a vacancy mechanism, the vacancies being provided by the iron deficit plus a small intrinsic disorder. Details of the diffusion mechanism are discussed, and it is concluded that direct jumps between normal sites aligned along the c-axis are favored over jumps from normal to interstitial sites which might then be followed by later jumps into new normal sites. However, the Bardeen-Herring correlation factor appears to operate in such a way that the rate limiting step for diffusion in both crystallographic directions is the jump from normal to interstitial sites.

MACHINING CHARACTERISTICS OF HIGH STRENGTH THERMAL RESISTANT MATERIALS. ITEM V, PART II:, MACHINING CHARACTERISTICS OF MOLYBDENUM - 0.5% TITANIUM ALLOY, by Leonard J. Nowikowski. Rept. for 1 Jan-30 Apr 60 on Subcontract to Contract AF 33(600)35967. 6 May 60, 75p. Wright Aeronautical serial rept. no. MP.00-210.
Order from OTS $2.00 PB 161 775

A study of the machining characteristics of a molybdenum alloy containing 1/2 percent titanium (Mo-1/2% Ti) has been conducted for turning, face milling, drilling, reaming and tapping operations. The data for the various machining tests is presented in graphical form to show the relationships between tool life, cutting speed, feed, tool geometry, tool material and cutting fluids. Grinding tests were conducted to determine the effect of grinding wheel grade, wheel speed, down feed, cross feed, and table speed on grinding ratio (G) and surface finish. The data for these studies is presented in graphical form to show G ratio as a function of grinding variables. Results of individual tests including surface finish data are shown in tabular form. Force measurements were made for turning and drilling the molybdenum alloy. The data is shown in graphical form to indicate the effect of machining variables on unit power, coefficient of friction and tool forces. (Author)

INFLUENCE OF THERMAL CYCLING ON THE BRITTLE TRANSITION TEMPERATURE OF LOW-CARBON STEEL, by Harry Majors, Jr. Technical rept. no. 2 on Contracts DA 01-009-ORD-396 and DA 01-009-ORD-454. Oct 57, 21p. 8 refs. OOR rept. no. 1230.3; AD-146 076.
Order from LC mi$2.70, ph$4.80 PB 147 861

The effects of thermal cycling on the brittle transition temperature of low carbon steels were investigated. Grooved-tension impact specimens of 2 steels were fully annealed and subjected to the following thermal cycling treatments (1) 300° to 1000° to 300°F and (2) 1000° to 1500° to 1000°F. Heating from 300° to 1000°F required 2 min and cooling from 1000° to 300°F required 45 sec. Quenching from 1500° to 1000° required 3 min. No changes in hardness (69 Rockwell B) and no alteration in grain size were effected by the 300° to 1000°F cycling. The average hardness was 75 Rockwell B with a refinement of grains after the 1000° to 1500°F cycling treatment. Tension impact tests were conducted between -100° and +90°F in a Baldwin Sountag model S1-1 testing machine. Some preliminary conclusions were (1) that thermal cycling across the thermal critical point lowered the brittle transition temperature, and at all temperatures down to -100°F there was some macroscopic plastic flow, and (2) that thermal cycling in the region of 300° to 1000°F tended to broaden the range of temperature transition from brittleness (0.00 in./in. true plastic fracture strain) to large ductility (0.35 in./in. true plastic fracture strain).

HEAT TREATMENT OF Mn-V-Mo AGE-HARDENING AUSTENITIC STEEL, by N. C. Howells and E. A. Lange. Interim rept. 16 May 60, 10p. 2 refs. NRL rept. 5464.
Order from OTS $0.50 PB 161 370

The age-hardening characteristics of Mn-V-Mo austenitic steels have been determined as a function of the temperature of the solution treatment. The optimum condition for developing the full age-hardening potential of an alloy is 1/2 hour at 2100°F followed by a water quench. Subsequent aging treatments required for maximum-hardness levels are: 1 hour at 1400°F, 6 hours at 1300°F, or 16 hours at 1200°F. An aging temperature between 1200°F and 1300°F is optimum for controlling the balance between yield strength and ductility. The yield strength of metals in the fully-aged condition is directly proportional to Brinell hardness, ranging from 80,000 to 150,000 psi for the compositions investigated. (Author)

Watertown Arsenal Labs., Mass.
CIRCULAR-PATCH TEST FOR EVALUATING ARMOR CRACK-SUSCEPTIBILITY, by Laurence E. Poteat and Richard W. Jones. May 60, 37p. 10 refs. WAL TR 710/1075.
Order from OTS $1.00 PB 161 822

An investigation was conducted to determine the effect of different procedures on the effectiveness of the circular-patch test specimen in the evaluation of plate crack susceptibility and to determine conditions suitable for a standard test. A test procedure was selected and used on several different heats of armor steel. Evaluation of these heats by this procedure placed the heats in the correct order of crack susceptibility as determined from the known fabrication history of the heats. (Author)

EXOTHERMIC RISERING EFFECTS ON PROPERTIES OF CAST ARMOR STEEL, by John M. Ingraham. June 60, 35p. 6 refs. WAL TR-616.1/1.
Order from OTS $1.00 PB 161 698

This is a limited study of the effects of the use of exothermic riser sleeves on the physical and mechanical properties of a cast armor test plate. The work reported herein consists of studies to determine hardness, macro- and microstructure, tensile and impact properties in areas adjacent to and removed from the riser area. (Author)

Watertown Arsenal Labs., Mass.
FORGING EFFECTS ON THE MECHANICAL PROPERTIES OF THREE BORON-TREATED STEELS, by Eugene DiCesare. July 59, 48p. 2 refs.
WAL TR 312/80; AD-219 749
Order from OTS $1.25 PB 151 814

Steel alloys 14B35, 14B50, and 10R70 containing boron and rare earth were hot forged (2250°F) by upsetting and drawing out (swaging) with reduction ratios up to 8 to 1 and 13 to 1, respectively. Longitudinal and transverse tensile and Charpy specimens, and micro and macrospecimens were tested and examined in the as-forged and in the heat-treated condition. Heat treatment resulted in optimum tensile properties and toughness in both the upset-forged and the drawnout, or swaged, ingots, at approximately 66% reduction for the swaged ingots, 50% reduction for the upset-forged 14B35 alloy, and 0% reduction for the upset-forged 14B50 and 10R70 alloys. HIGH STRENGTH STEEL: EFFECT OF VARYING COMPOSITION TO A TARGET HARDENABILITY, AND AN EXPERIMENTAL SILICON-RICH BORON-TREATED LOW ALLOY STEEL, by S. V. Arnold.

Oct 59, 39p. 11 refs. WAL TR 320.1/1; AD-226 966.
Order from OTS $1.00 PB 161 007

The tensile, notched tensile and impact properties of a number of experimental 0.30% carbon nickel-chromium-molybdenum steels, made to target composition of calculated 15" DI hardenability, were determined after quenching and tempering at 450°F. Tensile notched tensile and impact properties of an experimental 0.33% carbon silicon-rich boron-treated steel with moderate amounts of chromium and molybdenum, when quenched and tempered within the range 450°-700°F, were exceptionally good. (Author)

Watertown Arsenal, Mass.
OBTAINING LEAST-COST FURNACE INPUT MIXES BY LINEAR PROGRAMMING, AND SOME INVENTORY IMPLICATIONS, by Gideon I. Gartner. July 59, 77p. 13 refs. Management Science rept. no. MS-1; AD-233 226.
Order from LC mi$4.50, ph$12.30 PB 146 836

Many combinations of furnace input materials exist, which will meet a set of given furnace output requirements. The linear programming technique can be used to choose that feasible material combination whose material cost is a minimum. The technique can be used to calculate optimal prescriptions for individual heats, or to determine which materials to buy to stock in inventory. While previous work has been done on the individual heat problem, this project is concerned with the "what to buy" decision. Several possible management policies which concern the extent to which linear programming might be used are described as are the implications of a linear programming based system to economic lot size determination. To justify the use of L. P. in this application as well as to illustrate several points, a number of problems, hypothetical and real, were solved on the IBM 704. (Author)

Watertown Arsenal Labs., Mass.
RISIDUAL TENSILE STRESS CONCENTRATIONS AND TENSILELY-STRESSED CRACKS VERSUS TOUGHNESS OF HEAT-TREATED AISI 4340 STEEL, by S. V. Arnold. May 60, 18p. 2 refs. Technical rept. no. WAL TR 834.21/1.
Order from LC mi$2.40, ph$3.30 PB 147 506

By bending standard Charpy V impact specimens over a fulcrum placed against the mouth of the notch, altered specimens were obtained with angles of permanent set ranging from a fraction to several degrees. The metal at the base of the Charpy notch underwent permanent compressive deformation and then, upon release of load, this metal was placed in residual tension by elastic recovery of the specimen. Incipient cracks formed at the base of the notch. Specimens were tested in impact over a range of temperatures to determine the effect of such alterations upon energy level and transition behavior of AISI 4340 steel quenched and tempered to various strength levels. (Author)

Watertown Arsenal Labs., Mass.
SPECTROCHEMICAL DETERMINATION OF ACID-SOLUBLE ALUMINUM IN LOW-ALLOY STEELS BY THE ROTATING-DISC METHOD, by F. G. Howell. June 59, 20p. 16 refs. Technical rept. WAL TR 804/19; AD-217 440.
Order from OTS $0.75 PB 151 812

A spectrographic method for the determination of acid-soluble aluminum in low-alloy steels was developed using a solution technique with a rotating graphite disc and a high-voltage alternating current spark. The method is rapid compared to chemical analysis, permitting a considerable saving in time. Of the common alloying elements used in low-alloy steels, only tungsten interferes. The method applies to samples containing 0.02% to 0.25% acid-soluble aluminum. This range includes most of the samples submitted for analysis. (Author)

THE DEVELOPMENT OF MINIMUM DESIGN DATA ON THE NEW TITANIUM ALLOYS BEING CONSIDERED IN THE TITANIUM SHEET-ROLLING PROGRAM, by W. W. Breindel, C. L. Seale and others. Quarterly rept. no. 4 on Contract NOas 57-148-C. 20 Feb 58, 17p. 4 refs; AD-158 618.
Order from LC mi$2.40, ph$3.30 PB 147 733

The effect of the ratio of the pin diameter to sheet thickness on the bearing strength is discussed. The decision was made to investigate this relationship for heat-treated 6 Al-4V Ti alloy. The use of the single shear-type specimen is illustrated by the presentation of additional data. Compression test procedures are described, and data are presented on annealed 6 Al-4V Ti alloy at testing temperatures of 80°, 400°, 600°, 800°, and 900°F. A tension apparatus was evaluated which permits the use of the same extensometer as that used for compression tests.

METALLURGICAL AND MECHANICAL CHARACTERISTICS OF HIGH-PURITY TITANIUM-BASE ALLOYS, by Richard W. Douglass, Frank C. Holden and others. Rept. for 15 Feb 58-15 Aug 59 on Metallic Materials, Contract AF 33(616)5462. Mar 60, 154p. 15 refs. WADC Technical rept. 59-595.
Order from OTS $3.00 PB 161 817

The relationships between mechanical properties, alloy composition, microstructure, and thermal history have been studied for high-purity titanium-base alloys. The alloy systems investigated include Ti-V, Ti-Cr, and Ti-W binary alloys, and Ti-Al-V, Ti-Al-Cr, Ti-O-V, Ti-O-Cr, and Ti-O-Mn ternary alloys. Mechanical-property data include tensile and flow properties, impact behavior, hardness, aging, and cooling-rate data. The effects of dispersions on the creep of Ti-W, Ti-Cu, and Ti-Si alloys were investigated. The metallurgical principles involved here and in previous work are discussed. (Author)

BERYLLIUM: A SEARCH OF THE LITERATURE 1957-1959, by Kenneth D. Carroll. Technical rept. Jan 60, 116p. 349 refs. LMSD-288190.
Order from OTS $2.50 PB 161 811

The broad field of beryllium metallurgy, crystallography, fabrication methods, and the application of Be to the aircraft and missile fields has been reviewed. References to the use of Be in nuclear reactors, nuclear fuels, and the effects of radiation have been omitted. There are references included as to the toxicology of Be, its hazard limits, and means of detection; however, this phase was of tangental interest and the references are not exhaustive. References to Cu-Be alloys have been omitted, but abstracts are included covering other Be alloys. The majority of the items cited have been abstracted; however, various annual reviews and progress reports were not. (See also PB 161 012)

A bibliography of reports listed in the two OTS monthly abstract journals: U. S. Government Research Reports and Technical Translations. Reports are arranged in categories as follows: beryllium metals and alloys; beryllium compounds, carbides, and isotopes; toxicity, safe handling of beryllium; translations on beryllium.

Watertown Arsenal Labs., Mass.
DETECTION BY NONDESTRUCTIVE TESTS OF OVERHEATING IN 2014-T6 ALUMINUM ALLOY, by Patrick C. McEleney and Everett L. Reed. May 60, 44p. 4 refs. WAL TR-140/27.
Order from OTS $1.25 PB 161 516

Ultrasonic attenuation tests have proved to be successful in the detection of "overheating" or "burning" in 2014-T6 aluminum alloy. Heretofore overheating was detected only by metallographic examination. Correlation between ultrasonic attenuation tests and metallographic studies of a series of overheated and nonoverheated 2014-T6 aluminum alloy samples has been successfully accomplished. Liquid penetrant, radiographic and electromagnetic tests can also be applied in certain instances to detect this condition. (Author)

HIGH-TEMPERATURE PROPERTIES AND ALLOYING BEHAVIOR OF THE REFRACTORY PLATINUM-GROUP METALS, by R. W. Douglass, F. C. Holden, and R. I. Jaffee. Technical phase rept. on Contract Nonr-2547(00). 14 Aug 59, 127p. 286 refs. AD-226 310.
Order from OTS $2.75 PB 161 823

A survey of the literature pertaining to the platinum-group metals and their alloys has been conducted as a part of the study of the metallurgical properties of the refractory platinum-group metals. Major emphasis was placed on the four more refractory metals: rhodium, iridium, osmium, and ruthenium. A selected bibliography and a list of references are included. (Author)

Climax Molybdenum Co. of Michigan, Detroit.
ARC-CAST MOLYBDENUM AND TUNGSTEN BASE ALLOYS (1957-1959) by M. Semchyshen and R. Q. Barr. Rept. on Contract Nonr-2390(00). 1959, 205p. 12 refs.
Order from OTS $3.50 PB 161 820

The studies can be categorized in the following manner: (1) Alloy Systems: This phase involves an investigation of molybdenum-base alloys containing substantial amounts of alloying addition. (2) Strengthening Mechanisms in Molybdenum-Base Alloys: Previous studies have shown that carbon plays a major role in the development of high temperature strength in Mo-Ti-C alloys. These studies have been continued and expanded to include Mo-Zr-C and Mo-Hf-C alloys. (3) Mechanical Properties of As-Cast Molybdenum-Base Alloys. Molybdenum-base alloys containing additions in excess of those which can be worked by presently-available facilities have demonstrated high elevated temperature hardness. (4) Evaluation of Electron-Beam Melted Molybdenum: Ingots melted by the electron-beam technique have been evaluated from the standpoint of purity and transition temperature in tension. (5) Tungsten-Base Alloys: A preliminary survey of tungsten-base alloys has been initiated. (6) Determination of Elastic Moduli of Molybdenum and Commercial Molybdenum-Base Alloys: The modulus of elasticity has been determined from tension stress-strain data for unalloyed molybdenum, Mo + 0.5% Ti, Mo + 0.5% Ti + 0.7% Zr, and Mo + 0.5% Zr over the range from room temperature to 2400 F.

Structural Metallurgy and Corrosion

Armour Research Foundation, Chicago, Ill.
PHASE RELATIONSHIPS IN SELECTED BINARY AND TERNARY VANADIUM-BASE ALLOYS SYSTEMS, by Steven A. Komjathy, Robert H. Read, and William Rostoker. Rept. for 1 May 58-31 July 59 on Solid State Research and Properties of Matter, Contract AF 33(616)5771. Jan 60, 79p. 35 refs. WADC Technical rept. 59-483.
Order from OTS $2.00 PB 161 816

In order to obtain information for the development of vanadium-base alloys, binary systems (V-La, V-Ce, V-Pr, V-Nd, V-Gd, V-Sn, V-Hf, V-Th, V-W and V-Re) and ternary systems (V-Ti-Nb, V-Ti-Mo, V-Ti-Ta, V-Ti-W, V-Ti-O, V-Ti-Si, and V-Ti-Be) were investigated for (1) the extent of the vanadium-rich solid solution between 800° and 1500°C, (2) the character of the second phase in equilibrium with the solid solution, and (3) the possible melt reaction. Metallographic examination, X-ray powder diffraction analysis, incipient melting point determination, differential thermal analysis, and microhardness tests were used as experimental technique. The experimental results are illustrated by partial phase diagrams, where it was necessary. In some cases work was done on compositions with less than 50 w/o V to resolve certain problems. Precipitation kinetics studies were carried out on selected alloy compositions in ternary systems V-Ti-O, V-Ti-Si, and V-Ti-Be. The age hardening of the alloys at 550°, 650°, and 750°C was followed by routine Vickers hardness tests. (Author)

THE EFFECT OF FOREIGN SUBSTANCES ON THE STRENGTH OF POWDER-METAL AGGREGATES, by Otto Zmeskal. Final rept. on Contract DA 01-009-ORD-439. 30 Sep 58, 119p. 1 ref; OOR rept. no. 1423.1: AD-206 839.
Order from LC mi$6.00, ph$18.30 PB 147 869

The report is divided in four parts, each dealing with a different pure metal. The metal matrices covered are copper, titanium, zirconium, and iron. The oxides were introduced by mixing the pure oxides with the pure metal powders. For each metal a program was devised to determine the optimum conditions of particle size, method of aggregation, pressing pressure, sintering atmosphere and temperature and additional pressing and sintering operations. The criteria used were density and hardness. Both cylinders and tensile bars were evaluated. The oxide added to copper was titania. This oxide was also used as the dispersed phase in titanium; to minimize oxide solubility, low temperature sintering was used with tin as the bonding agent. Zirconia was added to zirconium; both hydride zirconium and high purity zirconium metal were used, but in both instances the resultant products were very brittle. The greatest amount of work was done with carbonyl iron. The oxides added included zirconia, thoria, ceria, lanthana, aeodymia, dysprosia, and gadolinia. Lanthana was found to prevent bonding of the iron matrix, while the other oxides were found to be only slightly embrittling. The iron - gadolinia mixture offers considerable promise for a control rod material in nuclear applications. In general, the oxide additions to each metal investigated resulted in increased hardness and strength at elevated temperatures.

Georgia Inst. of Tech. Engineering Experiment Station, Atlanta.
THIN METAL FILMS AS CORROSION INDICATORS, by Richard B. Belser and Frank E. Hankinson. Rept. for 15 Nov 57-15 Nov 58 on Finishes and Materials Preservation, Contract AF 33(616)3879. May 59, 56p. 11 refs. WADC Technical rept. 59-149; AD-214 886.
Order from OTS $1.50 PB 151 974

Investigation of the corrosion behavior of thin metal films for possible utilization in economic and reliable corrosion indicators. The corrosion behavior of iron, bimetal films of iron and copper, manganese, and metal films sensitized by salts were observed in various cleaning procedures were examined. Natural corrosion of a metal film appeared to be a two-stage process. Sensitization of the metal film negates one of the steps and the film becomes primarily an integrator of the conditions of temperature and humidity to which the film is subsequently exposed. Both sensitized and unsensitized metal films may be needed to indicate corrosive conditions. (Author)

Lockheed Aircraft Corp., Sunnyvale, Calif.
ELECTRONIC STRUCTURE OF BERYLLIUM, by George C. Kuczynski. Technical memo. Aug 59, 28p. 10 refs. LMSD-288003; AD-226 302.
Order from LC mi$2.70, ph$4.80 PB 147 681

The theoretical model of beryllium proposed by Herring and Hill [Phys. Rev. 58:132, 1940] is capable of explaining most of the apparent anomalies of the physical properties encountered in this metal. The high Debye temperature is due to high binding energy not unusual in the metals of the first row of the periodic table, whose nuclei are only feebly screened by ls shell electrons. Although the crystallographic structure of beryllium is not predictable from the theory, the electron distribution within the first Brillouin zone seems to lead to a good qualitative correlation of the electrical magnetic properties. Further extension of the theory is capable of accounting for the apparently anomalous change of c/a ratio with temperature, as this report attempts to demonstrate. The only real anomaly which cannot be properly explained is a very low value of the Poisson's ratio. This may be because the present determinations of the elastic constants are not entirely trustworthy. (Author)

Massachusetts Inst. of Tech., Cambridge.
THE INITIAL STAGES OF PLASTIC DEFORMATION IN ALUMINUM AND COPPER, by A. R. Rosenfield (Master's thesis) and B. L. Averbach. Technical rept. no. 1 on Contract Nonr-1841(35). 1959, 48p. 22 refs. AD-226 097.
Order from LC mi$3.30, ph$7.80 PB 148 153

The early stages of plastic flow and microcreep in aluminum and copper have been studied with a strain sensitivity of 2×10^{-6} at temperatures ranging from 25°C (77°F) to -196°C (-321°F) as a function of composition and substructure. The temperature dependence of the elastic limit in both materials is interpreted as arising from a thermal activation of stacking faults under stress, and this model results in values of 65 and 210 ergs/cm^2 for the stacking fault energies of copper and aluminum, respectively. The effects of impurities differ in the two materials and have been ascribed to the presence of precipitates in aluminum and solid solution formation in the case of copper. The jog formation energy in both materials has been measured from an analysis of the stress-strain curve on unloading, giving a value of 0.49 e.v. for copper and 0.21 e.v. for aluminum. (Author)

National Research Labs., Ottawa (Canada).
THERMAL STRESSING DUE TO AN ARBITRARY HEAT SOURCE IN A CIRCULAR CUT-OUT, by G. R. Cowper. Mar 60, 26p. Mechanical Engineering rept. MS-101.
Order from LC mi$2.70, ph$4.80 PB 147 915

This report presents formulas for the thermal stresses and displacements in a circular elastic plate with a concentric circular cut-out due to an arbitrary but steady heat input at the edges of the plate. Formulas for thermal stresses in an infinite plate with a single circular cut-out are obtained as a limiting case. Numerical results are worked out for the case in which an arbitrary arc of the edge of the cut-out is held at a high temperature while the remainder of the edge remains cool. (Author)

INVESTIGATION OF CORROSION INHIBITORS FOR CLOSED COOLING SYSTEMS OF DIESEL ENGINES, by G. R. Garber. 11 May 55, 16p. 2 refs. Evaluation rept. 010162G.
Order from LC mi$2.40, ph$3.30 PB 148 704

A 1,000-hour laboratory test of corrosion inhibitors for closed cooling-water systems of naval diesel engines has been completed. Alkaline-chromate inhibitor containing phosphate gave best protection under the conditions of test. (Author)

Pitman-Dunn Labs. Group, Frankford Arsenal, Philadelphia, Pa.
CORROSION OF WELDED ALUMINUM ALLOYS IN INHIBITED RED FUMING NITRIC ACID, by M. S. Orysh, L. L. Gruss, and A. Gallaccio. Jan 60, 77p. 37 refs. Technical rept. R-1524.
Order from LC mi$4.50, ph$12.30 PB 147 905

An investigation was conducted to determine the resistance of six welded aluminum alloys to corrosion by inhibited red fuming nitric acid (IRFNA) for 40, 100, 180, and 360 days at -30°, 80°, 114°, and 150° F. The corrosion of the welded alloy combinations exposed to IRFNA progressed with time except when exposed at -30°F. The tensile strengths of the welds and base materials were not adversely affected by contact with IRFNA for the duration of one year at the temperatures investigated. The corrosion rates of the 3003/1100 and 5052/5052 combinations increased, whereas that of the 2014/4043 combination decreased as the water concentration of the IRFNA was increased to 7.5 percent.

[RIAS, Inc., Baltimore, Md.]
INVESTIGATION OF THE FRACTURE OF METALS, by I. R. Kramer. Final rept. on Contract Nonr-2616(00). 31 July 59, 22p. 21 refs.
Order from LC mi$2.70, ph$4.80 PB 147 077

The delay time for the initiation of plastic flow was studied in single crystals of aluminum, iron and zinc. The delay time of aluminum was found to be affected by pre-strain and orientation. Values for the "activated" volume are too small to be interpreted in terms of forest dislocation. The activated energy is found to vary with pre-strain. For iron, the activated energy compared favorably with values calculated from Cottrell's equation. The presence of nitrogen in zinc is found to increase the delay time. (Author)

Watertown Arsenal Labs., Mass.
NOTCH SENSITIVITY AND LAMINATED CHARPY IMPACT STRENGTH OF 1100-F AND 2024-T4 ALUMINUM ALLOY SIMULATED SHEET, by S. V. Arnold. Sep 59, 21p. 3 refs. WAL TR 341.5/1; AD-225 559.
Order from OTS $0.75 PB 151 898

Simulated sheet of 1100-F and 2024-T4 aluminum alloys were fashioned in 0.050, 0.080, 0.100, 0.133, and 0.200-inch gages by removing equal amounts of stock from each rolled surface of 0.250-inch plate. Laminated Charpy specimens 0.400-inch thick were assembled from this simulated sheet and tested over the range -196° to 400°C. Notched and unnotched tensile specimens were tested at room temperature. (Author)

TEMPERATURE GRADIENT: HARDNESS TECHNIQUE FOR DETERMINATION OF RECRYSTALLIZATION TEMPERATURE, by Joseph M. Dhosi and Marvin B. Pierson. May 60, 22p. WAL TR 831.1/1.
Order from OTS $0.75 PB 161 473

A technique was developed by which recrystallization temperature of alloys can be determined rapidly and with satisfactory accuracy. A 6" - 7" bar of the alloy is heated for a specific time in a specially designed gradient furnace and cooled. A hardness survey is then made along the bar and this is cross-plotted against the temperature gradient to which it had been subjected. The temperature at that point of the bar where hardness values fall off abruptly is then designated as the recrystallization temperature. (Author)

THE LATERAL DISTRIBUTION OF PENETRATING PARTICLES IN COSMIC RAY EXTENSIVE AIR SHOWERS, by James Arthur Earl. Doctoral thesis. Technical rept. no. 70 on Contract Nonr-1841(16) and National Science Foundation Grants G2055 and G3006. 31 Aug 59, 91p. 22 refs. AD-226 648.
Order from LC mi$5.40, ph$15.30 PB 147 713

The penetrating component of extensive air showers detected by the MIT air shower experiment at Harvard, Massachusetts, was observed with the aid of a large hodoscope shielded by 985 g/cm^2 of lead. The number of electrons, core location, and arrival direction of each shower were given by the air shower experiment. Mu-mesons associated with a shower could be identified by requiring the projected zenith angle as measured by the hodoscope to agree with the known arrival direction of the shower. An auxiliary detector consisting of a single heavily shielded tray of counters was operated 920 m from the center of the array. In showers with zenith angles less than 25° the density of mu-mesons is proportional to $r^{-1.0 \pm .2}$ for r between 20 and 150 m. (r is the distance from the shower core to the meson detector.) For r between 200 and 900 m the density is proportional to $r^{-2.2 \pm .1}$. The shape of the lateral distribution changes as the zenith angle of the showers is increased. The nature of this change is such that the mesons in inclined showers are more spread out than those in vertical showers. The effect of the magnetic field of the earth on the lateral distribution is small. The meson density near the core is proportional to $Ne^{-.79 \pm .05}$ where Ne is the number of electrons in the shower. For showers with a constant observed number of electrons, the meson density near the core does not change with zenith angle. (Author)

EPI-THERMAL DOSE AND ATOMIC PRODUCTION CALCULATIONS, by Walter R. Burrus. Rept. on Contract AF 33(600)32055. Jan 60, 47p. 13 refs. Nuclear rept. 40R; AD-207 003.
Order from LC mi$3.30, ph$7.80 PB 148 381

The cross sections for energy absorption were determined for several common elements as a function of energy, and average cross sections were calculated for each of 3 representative reactor neutron spectra. These average cross sections vary for different spectra, but the variations for the representative spectra selected were no larger than a factor of 2. Most of the cross sections vary from spectra to spectra in the same general manner, so comparison of one cross section with another is much more accurate that the determination of absolute value of the average cross section. The conversion of integral flux ϕ (E) (flux above energy E) to total energy flux is determined for each of the 3 representative spectra. The fraction of the absorbed dose effective in producing atomic displacements was computed for several common metals. It may be multiplied by the absorbed energy to give the energy used in formation of atomic displacements. This 2-step calculation has an advantage over a direct calculation of the number of atomic displacements in that the result is completely insensitive to the critical ionizing energy. If the displacement energy is known, the number of atomic displacements may be found by dividing the energy used in atomic displacement production by the average energy required to produce one atomic displacement, about twice the displacement energy. TIME-INDEPENDENT NON-RELATIVISTIC COLLISION THEORY, by E. Gerjuoy. Technical rept. no. 4 on Capture-Loss and Ionization Cross-Sections of Ions and Neutral Particles, Contract Nonr-624(06). Dec 57, 61p. 21 refs.
Order from LC mi$3.90, ph$10.80 PB 138 206

Arbitrarily complicated rearrangement collisions describable by the time-independent non-relativistic Schrodinger equation are treated in a wholly time-independent framework, without explicit reference to transition probabilities. Introducing a generalized probability current operator for many-particle systems, the current flow at large distances can be computed in complete analogy with one-particle scattering. This procedure leads to the same formal expressions for reaction rates as are obtained from more conventional formulations.

Texas Nuclear Corp., Austin.
ELASTIC AND INELASTIC SCATTERING OF 4.1 MEV NEUTRONS FROM Ca, Mo, Sb, AND Hg, by Lloyd D. Vincent, Ira L. Morgan and J. T. Prud'homme. Rept. for 15 Mar 59-18 Feb 60 on Contract AF 33(616)5619. Apr 60, 64p. 51 refs. WADD TR-60-217.
Order from OTS $1.75 PB 161 807

An investigation of the interaction of 4.1 Mev neutrons with calcium, molybdenum, antimony, barium, and mercury has been performed. The following determinations have been made: the angular distribution of the elastically scattered neutrons from Ca, Mo, Sb, Ba, and Hg; the angular distribution of the inelastically scattered neutrons form Mo, Sb, Ba, and Hg; energy distributions at 90° for Ca, Mo, Sb, Ba, and Hg; nuclear temperatures for the residual nucleus of Mo, Sb, Ba, and Hg; total, elastic, and non-elastic cross sections for Ca, Mo, Sb, Ba, and Hg. EXPERIMENTAL AND RESEARCH WORK IN NEUTRON DOSIMETRY, by J. E. Drennan and C. S. Peet. Quarterly progress rept. no. 1, 15 May-15 Aug 59, on Contract DA 36-039-sc-78924. 15 Aug 59, 10p. 6 refs. AD-228 397.
Order from LC mi$1.80, ph$1.80 PB 147 980

Processing techniques for the preparation of wide-base conductivity-modulated, silicon-diffused rectifiers are used for the preparation of a set of experimental units. These techniques provide a base from which any modifications can be made. A statistically designed experimental program was initiated which should be useful for determining the optimum geometry and forward voltage for the conductivity-modulated silicon diode used in neutron dosimetry. The program should also provide necessary information for the design of associated measurement circuitry. Theoretical and experimental investigations pertaining to the physical phenomena involved in the rectifier were initiated. (Author)

EXPERIMENTAL AND RESEARCH WORK IN NEUTRON DOSIMETRY, by J. E. Drennan, A. R. Zacaroli and others. Quarterly progress rept. no. 2, 15 Aug-14 Nov 59, on Contract DA 36-039-sc-78924. 15 Nov 59, 39p. 17 refs. AD-233 429.
Order from LC mi$3.00, ph$6.30 PB 147 981

Modifications in processing techniques were designed to obtain higher initial charge-carrier lifetimes, since the sensitivity of the dosimeter rectifiers to neutron exposure results primarily from a decrease in lifetime. Experiments were carried out to investigate the sensitivity of 2 sets of experimental units to pure gamma radiation and to the fast-neutron radiation in the Battelle Research Reactor. Theoretical investigations were conducted to establish the expected relative sensitivity of the dosimeter rectifiers to gamma, thermal-neutron, and fast-neutron radiation. A study of the device performance characteristics in relation to the practical read-out circuitry possibilities was conducted. The greatest sensitivity of the dosimeter rectifiers will be obtained with base widths of 0.020 in. or greater. There is evidence that gamma radiation in the dose range of practical interest will not affect the dosimeter-rectifier parameters of interest to this application significantly. Theoretical investigations indicate that the dosimeter-rectifier parameters should not be affected appreciably by either gamma or thermal-neutron radiation in the dose range of interest. DESIGN OF A DUAL SENSOR GAMMA RAY CALORIMETER, by James R. Coss and Philip B. Hemmig. Rept. for Sep 58-Jan 60 on Materials Analysis and Evaluation Techniques. Mar 60, 17p. 12 refs. WADD Technical note 60-48.
Order from OTS $0.50 PB 161 787

The theoretical and design considerations for the construction of dual sensor gamma ray calorimeter are presented. The advantages of this type of dosimetry over commonly used present day types are pointed out and justified. The small size, high reproducibility, and small expense of this instrument made it a potentially very useful tool for use in radiation effects programs. The differences in equilibrium temperature attained by two slugs, via gamma heating, is measured as a voltage by thermocouples, and this thermocouple voltage correlated to the dose rate. (Author)

MAGNETOHYDRODYNAMIC POWER GENERATION USING NUCLEAR FUEL, by Richard J. Rosa. Mar 60, 21p. 11 refs. Research rept. 87; AD-234 568.
Order from OTS $0.75 PB 161 824

A brief review is given of the basic theory of magnetohydrodynamic (MHD) power generators. The basic electrical properties of gases are reviewed briefly. Overall performance characteristics of MHD generators are presented as a function of these gas properties. This gives an indication of the future potential of MHD as a conversion technique. An experimental MHD generator which was built at the Avco-Everett Research Laboratory is described and its performance discussed. MHD power plant cycles are discussed. A cycle designed for use with a nuclear reactor is described. Some of the possibilities for the future are discussed in which more exotic forms of high temperature reactor combined with an MHD generator may make possible nuclear powered systems having, by present standards, very low cost, high efficiency, and/or light weight. NEUTRON FLUX MEASUREMENTS FOR MATERIALS IRRADIATION EXPERIMENTS AT ARGONNE NATIONAL LABORATORY, BROOKHAVEN NATIONAL LABORATORY, OAK RIDGE NATIONAL LABORATORY, AND NATIONAL REACTOR TEST STATION, by L. E. Steele and J. R. Hawthorne. Interim rept. 23 May 60, 11p. 3 refs. NRL rept. 5483.
Order from OTS $0.50 PB 161 456

In studies of the effects of nuclear radiation upon the properties of steel, a continuous effort has been made to measure accurately the neutron-flux density and energy spectrum in four research reactors. Such measurement, made with various dosimeter materials, have determined which reactor facility provides the desired nuclear environment, and have served as necessary parameters in assessing mechanical property changes in irradiated steels. Flux surveys for all reactor experiments were limited to threshold detectors with nuclear and physical characteristics suitable for extended reactor exposure under varying environmental conditions. These monitors, cobalt, cadmium-shielded cobalt, nickel, and sulfur, were utilized in flux measurements. The neutron-flux data for high-flux positions in these four research reactors show a high-degree of correlation with changes in materials properties after irradiation.

STUDY OF COKE-AGGREGATE CONCRETE AS A SHIELD TO ELECTROMAGNETIC RADIATION, by P. F. Nicholson. Interim rept. 6 May 60, 11p. NRL rept. 5473.
Order from LC mi$2.40, ph$3.30 PB 145 522

The electromagnetic behavior of a coke-aggregate concrete as a shield to radiation has been investigated. Measurements have been taken on a sample within the frequency range from 1 to 1000 Mc. The loss-versus-frequency characteristic can be predicted with reasonable accuracy by the adaptation of classical propagation theory to the transmission of electromagnetic waves through an imperfect conductor. With a knowledge of the approximate value of complex permittivity and a measurement of direct-current conductivity, substitution of these parameters into a general equation will then yield the total insertion loss at the desired frequency. THE EFFECT OF NUCLEAR RADIATION ON SEMICONDUCTOR MATERIALS, by F. J. Reid, J. W. Moody, and R. K. Willardson. Rept. on Contract AF 33(616)5171. 20 Dec 57, 48p. 44 refs. REIC rept. no. 1; AD-147 399
Order from LC mi$3.30, ph$7.80 PB 147 101

A literature survey is presented on radiation effects in semiconductor materials. Results indicate that Ge is relatively radiation resistant. For 1 to 30 ohm-cm Ge the minority-carrier lifetime and the conductivity begin to be affected at about 10^{11} fast neutrons/sqcm. Less pure Ge(<1 ohm-cm) gives greater radiation resistance. Si appears to be less radiation resistant than Ge by as much as a factor of 2.

Radiation Effects Information Center, Battelle Memorial Inst., Columbus, Ohio.
THE EFFECT OF NUCLEAR RADIATION ON SEMICONDUCTOR MATERIALS (FIRST ADDENDUM) by L. W. Aukerman. Rept. on Contract AF 33(616)5171. 31 Mar 59, 36p. 116 refs. REIC rept. no. 1 (Addendum); AD-210 758.
Order from LC mi$3.00, ph$6.30 PB 147 101-S-1

The literature on the effects of high-energy-radiation semiconductor materials received by the Radiation Effects Information Center during 1958 and 1959 has been reviewed and compared. The materials covered are germanium, silicon, and several compound semiconductors including indium antimonide, gallium antimonide, indium arsenide, aluminum antimonide, and gallium arsenide. All types of irradiation capable of producing permanent damage are considered. A rather serious discrepancy between theory and experiment appears to be present in most cases investigated. (Author) (See also PB 147 101)

Radiation Effects Information Center, Battelle Memorial Inst., Columbus, Ohio.
THE EFFECT OF NUCLEAR RADIATION ON STRUCTURAL METALS, by B. C. Allen, A. K. Wolff and others. Rept. on Contract AF 33(616)5171. 31 May 58, 43p. 62 refs. REIC rept. no. 5; AD-157 170.
Order from LC mi$3.30, ph$7.80 PB 147 103

This report presents the state of the art on the effects of nuclear radiation on structural metals from 1943 through 1957. The general effects of various types of radiation on metals are discussed and the damage mechanisms are outlined. Following this is a topical discussion of the effects of fast neutrons on the physical and electrical properties and corrosion resistance of metals. Tabular data are presented on these effects. Experimental evidence to date indicates that structural metals are quite resistant to nuclear radiation when compared to such things as organic compounds or electronic components. Fast neutrons in integrated flux levels above 10^{19} nvt represent the only reactor radiation that can significantly affect the properties of structural nonfissionable metals. (Author)

COLD WEATHER EVALUATION OF PROTECTORS, EAR, SOUND, TYPE PRU-1/P AND HELMET, SOUND PROTECTOR ACCOMMODATING, TYPE HGU-1/P, by Norman C. Van Tassel. May 59, 9p. Technical note AAL-TN-59-1; AD-230 841.
Order from LC mi$1.80, ph$1.80 PB 146 120

The HGU-1/P helmet and PRU-1/P ear protector were evaluated for use with the AF parka hood in arctic weather. The wool-backing helmet was designed to accommodate the ear protectors. The ear protectors consist of close-fitting muffs held in place over the ears by an adjustable headband. Tests indicated that the helmet and ear protector are compatible for wear with the AF parka hood. Of the 5 individuals who evaluated the helmet, 3 stated it provided adequate thermal protection at -40°F, one at -5°F, and one at 0°F. The design of the helmet and ear protector was considered satisfactory. Low-frequency sounds or (Personnel Supplies and Personal Equipment, speaking tones can be heard while wearing the helmet and ear protector. Helmet and protector did not cause any undue discomfort to the user.

Army Chemical Warfare Labs., Army Chemical Center, Md.
PHYSIOLOGICAL EVALUATION OF THE E52R26 CIVILIAN PROTECTIVE MASK, by E. G. Cummings, F. N. Craig, and W. V. Blevins. Nov 59, 26p. 14 refs. CWLR-2323.
Order from LC mi$2.70, ph$4.80 PB 146 458

Air-flow measurements by the new Gulton transducer and pressure measurements resulted in inspiratory resistance of 0.5 mm H_2O/l/min at flows of 85 l/min and expiratory resistances of 0.2 mm H_2O/l/min. Dead space, measured by continually monitoring mask CO_2 and flow, varied from 0.35 to 0.55 l, depending upon the tidal volume. The E52R26 mask does not impose excessive physiological stress on the wearer in environments tested for periods of 1 hr and under light exercise conditions. In environmental temperatures below 40°F, fogging was severe, necessitating the use of the antidim cloth in order to produce good visibility. Indications are that lens frosting may produce poor visibility when the mask is worn at temperatures below freezing. If the filter pads absorbed over 20 g, breathing became difficult, thus shortening the wearing time. In a moderate to heavy natural rain, the mask can be worn for an hour without difficulty. However, in torrential downpours (3.7 in./hr), the maximum mask-wearing time was 20 to 25 min, because of high resistance.

Quartermaster Research and Engineering Center, Natick, Mass.
AUXILIARY HEATING SYSTEMS FOR COMBAT CLOTHING, by Leo A. Spano and Theodore L. Bailey. July 59, 67p. 15 refs. Technical rept. QMRE-20 (APO-1); AD-226 500.
Order from LC mi$3.90, ph$10.80 PB 146 126

Findings revealed that: (1) auxiliary heating systems for the inactive or moderately active soldier operating in cold-dry climates are needed to compensate for the heat debt experienced by individuals clothed in the present 4.3 Clo cold-dry ensemble; (2) protection of the hands and face is presently a serious and urgent problem; (3) protection of the feet, although serious, is not as critical as that of the hands and face; and (4) no present standard combat clothing system provides or even approaches the protective requirements stipulated by the approved military characteristics covering cold-dry body clothing, handwear, footwear, and headgear. A program was undertaken to (1) develop and evaluate auxiliary heating systems for rewarming troops that have been exposed to deep cold; (2) develop auxiliary heating devices and systems for the extremities to increase the combat-effective time a soldier can be exposed to extreme cold environments; and (3) to design and develop a combat clothing ensemble provided with an integral auxiliary heating system to keep the wearer combat-effective at all times when operating in extremely cold climates.

PHYSICS

Harvard U. Div. of Engineering and Applied Physics, Cambridge, Mass.
BUCKLING OF CLAMPED SHALLOW SPHERICAL SHELLS, by Bernard Budiansky. Technical rept. no. 5 on Contract Nonr-1866(02). Aug 59, 44p. 16 refs. AD-225 640.
Order from LC mi$3.30, ph$7.80 PB 147 719

This paper is concerned with the axisymmetric buckling under uniform pressure of a shallow portion of a spherical shell, clamped along a circular boundary. The present analysis, which exploits an integral-equation formulation of the problem, should give results of uniform accuracy for all thicknesses.

National Bureau of Standards, Boulder, Colo.
A BIBLIOGRAPHY OF THE PHYSICAL EQUILIBRIA AND RELATED PROPERTIES OF SOME CRYOGENIC SYSTEMS, by Thomas M. Flynn. May 60, 126p. 681 refs. Technical note no. 56.
Order from OTS $1.75 PB 161 557

A bibliography of approximately 700 references is presented on the physical equilibria and related properties of several important cryogenic systems. The systems considered are the pure components and mixtures of: hydrogen, helium, nitrogen, carbon dioxide, carbon monoxide, methane, ethane, and propane. (Author)

STUDY OF INFLUENCE OF SOUND WAVES ON CHEMICAL REACTION RATES, by H. M. Wight. Rept. on Contract AF 49(638)311. 31 Mar 60, 49p. 37 refs. Technical rept. U-858; AFOSR-TR-60-60.
Order from LC mi$3.30, ph$7.80 PB 147 936

Within the general context of exploring possible mechanisms contributing to resonance combustion instability in rocket motors, a study has been made of the interaction of sound waves and homogeneous gas phase chemical reactions. This has involved two aspects: (1) the enhancement of reaction rates by sound waves, and (2) the amplification or absorption of a traveling sound wave by a gas phase reaction. Theoretical analysis relating to (1) and (2) indicate that gas phase enhancement and amplification are not expected to be mechanisms of major importance contributing to resonance. (Author)

Lockheed Aircraft Corp., Sunnyvale, Calif.
ON THE PROPAGATION OF ACOUSTIC WAVES IN GASES AT HIGH TEMPERATURES AND REDUCED PRESSURES, by G. L. Vick. Technical rept. 30 June 59, 31p. 16 refs. LMSD-49762; AD-228 429.
Order from LC mi$3.00, ph$6.30 PB 147 679

Thermodynamic theory is reviewed, as it applies to the propagation of acoustic waves in gases at elevated temperatures and reduced densities. The results of this study establish the applicability of acoustic methods to the measurement of gas temperature and to research on vibrational relaxation, dissociative relaxation, and viscosity phenomena under high temperature, low density conditions. It is concluded that acoustic waves will be propagated with a dispersion of less than $a/a_o = 1.1$ at frequencies below 1 mc at a temperature of 5000°K. Viscosity effects become predominant above 1 mc, resulting in greatly increased dispersion. Two absorption peaks occur at frequencies lower than 0.1 mc corresponding to vibrational and dissociative relaxation. This study of dispersion and absorption indicates that the velocity of acoustic waves may be reliably used as a measure of gas temperature at frequencies below 1 mc. This could have wide application for shock-tube instrumentation. Measurements of acoustic attenuation below 0.1 mc would yield information concerning vibrational and dissociative relaxation. Viscosity effects may be studied from acoustic wave velocity data at frequencies above 1 mc. (Author)

Watertown Arsenal Labs., Mass.
ULTRASONIC METHODS FOR NEAR-SURFACE FLAW DETECTION, by Otto R. Gericke. Nov 59, 16p. 5 refs. WAL TR-143/33; AD-229 387.
Order from OTS $0.50 PB 161 048

In order to detect near-surface defects, either extremely short ultrasonic pulses or an artificial pulse delay are required. The objective of the work covered by this report was to investigate the possibilities of pulse delay, and develop methods which can be used for practical applications. Three of the procedures which are discussed show promising experimental results. Defects as close as 0.015" to the test surface can be detected, although fairly long pulses of 3 to 10 microseconds duration are used. (Author)

ELECTRICAL AND SPECTRAL CHARACTERISTICS OF HIGH CURRENT SPARK DISCHARGES, by Leon Blitzer. Final rept. for 20 Feb 56-28 Feb 59 on

Contract DA 04-495-ORD-434. [1959] 27p. 10 refs.
OOR rept. 786-...; AD-217 573.
Order from LC mi$2.70, ph$4.80 PB 147 592

A study was made of the electrical and spectral characteristics following breakdown of high-current condensed spark discharges. The discharge current was found to be very nearly the same as in an ordinary LCR circuit. Gap voltages in all cases were observed to fall from initial high values (3.5-6.0 kv) to about 50 v in about 1.0 μsec and to decrease thereafter linearly with time. The gap resistance was found to be very small compared to the resistance of the remainder of the circuit. In general, the electrical parameters were little affected by the material of the electrode. From relative intensities of spectral lines of Fe I, Ni and Ti II a study was also made of excitation temperatures in the discharge column. In all cases the relative line intensities were consistent with a Boltzmann distribution of the atoms among the excited states. Wide variations in temperature during the history of the discharge point led to an absence of any well-defined equilibrium. At the same time no significant differences were observed from one spectrum to another, calculated temperatures being essentially in the region 6000-8000°K both for damped and oscillatory discharges. SPIN WAVE CALCULATIONS FOR FERRIMAGNETICS, ANTIFERROMAGNETICS AND FERROMAGNETICS, by Henry Unruh, Jr. Technical rept. no. 3 on Contract Nonr-1141(07). Aug 59, 88p. 21 refs.
AD-229 391.
Order from LC mi$4.80, ph$13.80 PB 147 723

The spin wave dispersion law for simple cubic and body centered cubic crystals of ferrimagnetic materials is derived. The result allows arbitrary g factors, spins, externally applied field and anisotropy fields if their interaction energy with the spins is in the cosine dependent form. If the interaction energy is in the cosine squared dependent form then the externally applied field must lie in the plane determined by the anisotropy fields on the 2 sublattices. Tables giving the integrated results for the specific heat and the deviation of the magnetization from its saturation value are given for a wide range of crystal constants and externally applied fields. EARTH CURRENT ACTIVITY AT COLLEGE, ALASKA, 1956-1958, by V. P. Hessler and E. M. Wescott. Scientific rept. no. 2 on Contract AF 19(604)3075 and NSF Grant C 4193. Feb 60, 68p. 18 refs. AFCRC-TN-60-293.
Order from LC mi$3.90, ph$10.80 PB 147 513

This report presents 3-hourly scalings of earth current activity for the entire period from January 1956 through December 1958. The data are analyzed for diurnal, seasonal, and yearly averages of activity. There is a pronounced diurnal variation in activity with a maximum at local midnight. The principal direction of the earth current disturbances at College is about N 33° W and is so constant that total activity in mv/km can be determined with sufficient accuracy from N-S records. Earth current activity has a high correlation with magnetic activity and other polar ionospheric phenomena. The average of six monthly correlation coefficients between magnetic daily A figures and earth current average daily mv/km is .948. Thus, the earth currents constitute a useful indicator of ionospheric activity. (Author) (See also PB 142 027)

MICROWAVE RESONANCE IN FERROMAGNETIC SYSTEMS AT HIGH-SIGNAL LEVELS, by J. J. Green. Scientific rept. no. 2, Series 2, on Contract AF 19(604)5487. 1 Dec 59, 122p. 48 refs. AFCRC-TN-60-367.
Order from LC mi$6.30, ph$19.80 PB 147 761

A study of ferromagnetic resonance at high-peak powers has been made in a series of rare earth garnets and in several ferrite spinel systems. The results are analyzed on the basis of a theory developed by Suhl and later modified by Schlömann. The onset to saturation observed in polycrystalline materials is in good agreement with the predictions of the modified theory. According to Suhl, the saturation at high-power levels is due to an exponential-type growth of certain spin waves. The line width of the unstable spin waves has been calculated from the slope of the saturation curve at high-power levels. The presence of rare earth impurities in YIG or cobalt in nickel ferrite leads to a rapid increase in the spin wave line width. This increase can be understood on the basis of a recent theory by Kittel. It has been observed that porosity does not affect the spin wave line width. Experiments on thin rods lead to the conclusion that the spin wave line width in YIG is a rapidly increasing function of k at X band. Numerous measurements of a fine structure in the saturation curves in YIG single crystals gave results which are in good agreement with a theory proposed by Schlömann. Investigations of single crystal GdIG revealed an anisotropy of the spin wave line width comparable to the anisotropy of the uniform mode line width. In nickel ferrite, the addition of zinc results in an increase in magnetization and a transition in the cause of resonance saturation from one type of spin wave to another.

EFFECT OF NEUTRON BOMBARDMENT ON THE MAGNETIC PROPERTIES OF IRON AND NICKEL OF VERY HIGH PERMEABILITY. III, by Giuseppe Biorci, Andrea Ferro, and Giorgio Montalenti. Final rept. (3b) on Contract AF 61(514)1331. Feb 60, 66p. 42 refs.
AFOSR-TR-60-66.
Order from LC mi$3.90, ph$10.80 PB 147 502

Several ring specimens of Cioffi-type iron and of very pure nickel have been prepared to measure the effects of neutron bombardment on the magnetic properties (magnetization curve and hysteresis loop). By proper heat treatments in hydrogen we have obtained maximum permeabilities of the order of 150.000 in iron and 5.000 in nickel. The irradiation has been made with large doses of fast neutrons (integrated flux of about 10^{19} n/cm^2 nvt). No remarkable variations in the magnetic properties of nickel have been observed after irradiation. The iron specimens have been examined before and after irradiation at fields (up to 150.000 A/m). In the region from 1.000 A/m up no appreciable variation has been observed in the curve of approach to saturation. At low fields the iron samples show a remarkable increase of coercive force and a relevant decrease (about 30%) of the maximum permeability. The conclusion is that the irradiation produces also some defects stable at room temperature whose size (or range of influence) are of the order of, or larger than, 1000 A. (See also PB 146 436)

THE MAGNETIZATION REVERSAL AND MICROWAVE RESONANCE PROGRAM DURING 1958, by R. W. Moss, C. F. Kooi and others. 26 Dec 58, 42p. 14 refs. LMSD-48359.
Order from LC mi$3.30, ph$7.80 PB 147 666

This program aims at the determination of the magnetization reversal mechanism in high-speed computer ferrites. The mechanisms, domain wall motion and domain rotation, depend on the damping parameter in different ways. Measurement of the damping parameter by microwave resonance means and by switching experiments shows that wall motion is the preferred mechanism in weak switching fields. This report also describes the experimental apparatus and the method of approach to the problem. (Author)

NON-LOCAL CURRENT-FIELD RELATIONSHIP IN METALS, by John L. Warren (Doctoral thesis) and Richard A. Ferrell. Rept. on Contract Nonr-1797(00). Aug 59, 18p. 11 refs. Physics Dept. technical rept. no. 150; AD-229 341.
Order from LC mi$2.40, ph$3.30 PB 148 180

Chamber's formula for the response of the conduction electrons of a metal to an internal transverse electric field is supplemented by a diffusion current when it is used for longitudinal fields. A new derivation of Chambers' formula is given by means of the Boltzmann transport equation, and the additional diffusion term in the current is exhibited explicitly. (Author)

THE MEASUREMENT OF MAGNETIC LOSSES BY ROTATING FIELD AND BY ROTATING SAMPLE EXPERIMENTS. by K. Atkins, H. Callen and others. Technical rept. no. 2 on Contract Nonr-551(28). [1959] 21p. 8 refs. AD-225 111 and AD-225 761.
Order from LC mi$2.70, ph$4.80 PB 147 601

Two types of experiments, designed to measure the intrinsic rotational damping in ferromagnetic materials, are discussed. The first type measures the mean angular deviation of the magnetization vector from the direction of a large applied magnetic field when the sample is rotated. The second type measures the torque on the sample when the sample is stationary but the applied magnetic field rotates. Analysis of these experiments sheds light on the physical basis of the dynamical equation, and particularly of the Landau, Lifshitz and Gilbert equations, which are equivalent in stationary-sample experiments for small damping. It is shown theoretically, and corroborated experimentally, that the losses in ferrites are too small to make a rotating sample experiment feasible with ferrite materials. A rotating sample experiment with thin metallic disks or films is theoretically feasible with the experimental set-up. (Author)

A SEARCH FOR THE IONIZATION OF H_2 ON DIFFUSION THROUGH Pd, by J. R. Radbill and R. J. Sunderland. Rept. on Contract AF 49(638)214. Feb 60, 20p. 26 refs. Aerojet rept. TN-34; AFOSR-TN-60-426.
Order from LC mi$2.40, ph$3.30 PB 147 505

A search has been made to detect the ionization of hydrogen through palladium. Using as a source a 0.005-in. palladium foil maintained at 1000°K, the mass spectrum of the emission has been determined, with and without the diffusion of hydrogen. Ions corresponding to singly charged Na^{23}, K^{39}, and K^{41} were detected with the Na^{23} mass peak predominating. No other ions were found within the mass range capability (1-240 amu) of the magnetic fields used. Our results indicate that the individual ion current densities at the emitter, due to thermally ionized hydrogen atoms or molecules, must be less than 10^{-9} amp/cm^2. (Author)

THE INFLUENCE OF THE ELECTRON VELOCITY DISTRIBUTION ON SPACE CHARGE WAVES, by Olof E. H. Rydbeck and K. H. B. Wilhelmsson. Rept. no. 3 on Contract AF 61(052)159. [1959] 26p. 3 refs. Research rept. no. 1, 1959; AFCRC-TN-60-352.
Order from LC mi$2.70, ph$4.80 PB 147 509

The purpose of this paper is to study the influence of an electron velocity distribution upon the wave propagation properties of electron beams with special regard to modern space charge wave amplifiers. The velocity distribution considered is the simplest possible one, namely a pulse of certain width and constant amplitude.

Chalmers U. of Tech. (Sweden).
OSCILLATORY PROPERTIES OF GYROMAGNETIC ELECTRONIC COLD PLASMAS WITH DRIFT MOTION. A STUDY OF CIRCULARLY BOUNDED AND INFINITELY EXTENDED MEDIA INCLUDING THE INFLUENCE OF COLLISIONS, by Hans Wilhelmsson. Rept. no. 4 on Contract AF 61(052)159. June 59, 46p. 23 refs. Research rept. no. 2, 1959; AFCRC-TN-60-353.
Order from LC mi$3.30, ph$7.80 PB 147 510

The result of a recent work by O. E. H. RYDBECK [1944] shows that radiation can be produced when space charge waves are carried by an electron beam through an ionized medium. The purpose of the present paper is to extend the treatment of the earlier publication by considering the influence of collisions. The collisional effects are described by means of effective collisional frequencies which are assumed different for the drifting electrons and for the electrons without drift motion. As in the previous investigation special attention is paid to the influence of the drift LORENTZ terms and of the relativistic corrections. Although the calculations, especially in the relativistic case, give rise to a considerable number of terms, the final expressions have a neat and concise form. The result of the investigation is that although the collisions affect the dispersion relations, the same types of waves will be excited under the same excitation conditions as in the absence of collisions. THERMIONIC THEORY AND TECHNIQUE, by John Cobb, William Cutler, and Anthony F. Dugan. Technical memo. Sep 59, 25p. 2 refs. LMSD-311695. AD-226 847.
Order from LC mi$2.70, ph$4.80 PB 147 682

The vacuum diode as a means of producing power by thermionic emission has been studied theoretically with respect to efficiency and power. Experimental results, however, indicate that no simple theory is adequate to predict the effect of interelectrode space charge. The parameters which govern the magnitude of the space charge also affect the specific power and efficiency. A simultaneous analysis of space charge, specific power, and efficiency is required to predict effectively cell performance and to facilitate cell design. If the analysis can be made to agree with the experiment, in general, a large part of the experimental program may be circumvented and more time devoted to the search for basic information concerning thermionic phenomena. This report presents the agreement already achieved between the actual experiment and a theory which embraces the cathode electron effect upon space charge. (Author)

Microwave Physics Lab., Sylvania Electric Products, Inc., Mountain View, Calif.
ELECTROMAGNETIC WAVE PROPAGATION IN THE HIGH TEMPERATURE PLASMAS, by Romayne F. Whitmer. Technical rept. on Contract AF 30(604)1944. 9 Apr 59, 46p. 5 refs. RADC-TN-59-81; AD-214 944.
Order from LC mi$3.30, ph$7.80 PB 147 027

Propagation through high temperature plasmas was studied for 2 different types of high-temperature plasmas. In the first type the electrons are at a relatively high temperature, whereas the ions and neutral particles are at, or near, room temperature. In the second type all the constituents of the plasma are at a fairly high temperature. The high electron temperature plasma can be produced by means of microwave breakdown at electron cyclotron resonance. Electrons receive energy very efficiently from the microwave field and lose energy slowly to the other particles. Hence, the neutral particles and ions remain at a relatively low temperature. The second type of plasma can be produced by means of a shock wave. In the region of the shock front all the particles are at a high temperature. Propagation studies will be performed for both types of high temperature plasmas. However, the propagation measurements reported are limited to the high electron temperature plasma. The microwave measurements include the measurement of attenuation, phase, signal distortion, and harmonic content. Both phases of this program are studied theoretically and experimentally. (Author).

Navy Electronics Lab., San Diego, Calif.
SYMPOSIUM ON TROPOSPHERIC RADIO WAVE PROPAGATION WITHIN THE HORIZON, HELD AT NAVY ELECTRONICS LABORATORY, 30 MARCH-2 APRIL, 1953. 2 Sep 53, 72p. 19 refs. Rept. no. 409.
Order from LC mi$4.50, ph$12.30 PB 148 649

The symposium covered three major topics -- terrain effects, refraction effects, and combined and other effects -- on which papers were presented by participants from the United States and several foreign countries. The present report includes these papers and on edited transcript of the summary session during which the main points of each topic session were reviewed. (Author)

UTILIZATION OF SELF-SUSTAINED ELECTRON EMISSION INVESTIGATION, by B. G. Firth and Warren C. Johnson. Rept. no. 4 (Final) 1 Oct 58-30 Sep 59, on Contract DA 36-039-sc-73051. [1959] 42p.
Order from LC mi$3.30, ph$7.80 PB 147 990

A 5 inch cathode ray tube with MgO cold cathode was made with a spot size 3 to 4 times that in a thermionic cathode tube, and a low beam current of 3 μa, operating at 3,000 volts on all high voltage elements. MgO cathode surface potentials for parallel plates 2 cm sq. and 4 mm apart have been measured in the order of 145-190 volts for plate potentials of 151-211 volts. Magnetic analysis of electron energy distribution from the MgO cathode showed a peak at 13.5 volts and 90 per cent of electrons less than 65 volts. Cold cathode emission starting and sustaining, cathode testing, and cathode current characteristics are discussed. Tests on secondary emission preamplifiers indicate that control of secondary emission rather than primary emission may be a promising method of improving both transconductance and frequency response of cold cathode tubes. A cold cathode dynatron oscillator was made to operate up to and beyond 20 mc with sufficient power and voltage for a local oscillator circuit. Audio power amplifier tubes Type DT-812B have been made to operate with dynamic Gm = 600 μmhos and 900 milliwatts audio output at tolerably low noise level and harmonic distortion. Cathode temperatures were measured within an accuracy of a few per cent by checking the resistance of the inactive heaters in them. (See also PB 147 988)

[Willow Run Labs.] U. of Michigan, Ypsilanti.
PREDICTION AND FILTERING FOR RANDOM PARAMETER SYSTEMS, by Frederick J. Beutler. Rept. on Proj. Michigan, Contract DA 36-039-sc-52654. June 58, 24p. 16 refs. 2144-259-T; AD-202 607.
Order from LC mi$2.70, ph$4.80 PB 145 972

An investigation was conducted in order to generalize the Wiener-Kolmogorov theory of optimum linear filtering and prediction of stationary random inputs. It is assumed that signal and noise have passed through a random device before being available for filtering and prediction. A random device is a unit whose behavior depends on an unknown parameter for which an a priori probability distribution is given. A number of engineering applications are cited. Two of these are worked out in some detail to illustrate the optimization procedure. (Author)

FORCE CONSTANT CALCULATIONS IN LINEAR TRIATOMIC MOLECULES FROM INFRARED AND MICROWAVE DATA, by Peter H. Verdier and E. Bright Wilson, Jr. Rept. on Contract Nonr-1866(14). [1959] 6p. 10 refs. AD-211 282.
Order from LC mi$1.80, ph$1.80 PB 146 185

Calculations of the complete quadratic potential energy function were made for the $O^{16}C^{13}S^{32}$ isotope and N_2O by using centrifugal distortion constants from microwave spectra and infrared frequencies. The potential function was $2V = f_{11}r_1^2 + 2f_{12}r_1r_2 + f_{22}r_2^2$, where r_1 and r_2 are the increases in the 2 bond lengths and the f's are the force constants. The sensitivity of the force constants was checked in each case. The sensitivity calculations indicated that corrections of vibrational frequencies to zero amplitude and for Fermi resonance and the use of equilibrium rotation constants (B_e and D_e) rather than observed values can have appreciable effects upon the computed force constants. By judicious choice of corrections to the rotational constant, B, and the stretching frequencies, force constants for N_2O can be obtained which agree with the accepted values to within 15% for the bond stretching constants and 75% for the interaction constant. The sensitivity of the calculated force constants to the value of the rotational constant, D, was determined.

Materials Research Lab., Watertown Arsenal, Mass.
A SIMPLE CORRELATED WAVE FUNCTION, by R. J. Weiss. May 60, 6p. 5 refs. MRL rept. no. 75.
Order from LC mi$1.80, ph$1.80 PB 147 484

A simple correlated ground state wave function for He like atoms is suggested. It has the proper behavior at the singularities and enables several of the observables to be evaluated analytically. (Author)

Minnesota U., Minneapolis.
STRUCTURAL INVESTIGATIONS OF LARGE MOLECULES BY X-RAY DIFFRACTION, by William N. Lipscomb. Final rept. on Contract AF 49(638)485. Oct 59, 4p. 4 refs. AFOSR-TR-60-31.
Order from LC mi$1.80, ph$1.80 PB 147 659

The three-dimensional structure, except for the absolute configuration, has been determined in an X-ray diffraction study of ψ-conhydrine hydrobromide. In agreement with recent chemical evidence, the OH and propyl groups are found to be trans to each other, and in the equatorial position relative to the saturated six-membered ring. The unit cell is orthorhombic in the space group D 4/2-P2$_1$2$_1$2$_1$, contains four $C_8H_{18}NOBr$, and has dimensions a =15.15, b=9.38, c =7.72 A.

Research Lab. of Electronics, Mass. Inst. of Tech., Cambridge.
THEORETICAL AND EXPERIMENTAL STUDY OF MOLECULAR-BEAM MICROWAVE SPECTROSCOPY, by Martin Peter and M. W. P. Strandberg. Rept. on Contract DA 36-039-sc-64637 and Technical rept. no. 1 on Contract DA 36-039-sc-73014, 25 Aug 57, 52p. 42 refs. Technical rept. 336; AD-200 421.
Order from LC mi$3.60, ph$9.30 PB 147 455

A variety of topics that bear directly upon the use of molecular-beam spectroscopic methods for precise frequency determination with the use of alkali-halide molecules are discussed. The rotational-energy spectrum, including resolvable hyperfine structure arising from quadripole and magnetic interactions, is calculated. An analysis of integrated line strength, or intensities, is presented. State selection is discussed in terms of the appropriate high-field Stark effect, for which new calculations are given. State selection with both axial and transverse-rod configurations is discussed, and trajectories for sodium chloride with the use of a transverse-rod state selector are indicated. The limitations of any selector which arise from nonadiabatic losses are analyzed. The design parameters of a microwave spectroscope, including signal-to-noise ratio and ultimate precision, are related to its geometric configuration, and a description of an apparatus that is adequate for high-resolution work is given. Related topics, such as the concept of efficiency of frequency measurements and frequency pulling, are discussed in generalized fashion. Conclusions that can be derived from this work, as to both present limitations and necessary future development, are drawn. (Author)

Space Sciences Lab., General Electric Co., Philadelphia, Pa.
THE FREE-FREE CONTINUUM OF OXYGEN, by R. G. Breene, Jr. and M. C. Nardone. Rept. on Contract AF 04(647)269. 29 Apr 60, 13p. 7 refs. Technical Information Series R60SD365.
Order from LC mi$2.40, ph$3.30 PB 147 523

Oxygen is treated in an example calculation of the free free absorption cross section. Wave functions for the free electron in the field of an oxygen atom under the assumption of no electron exchange or core polarization are calculated on the IBM 704. These wave functions are applied to the calculation of the free free absorption corresponding to a particular continuum frequency and initial state energy. In this calculation the dipole acceleration form of the matrix element is computed. The matrix element calculation is carried out on the LGP-30. These partial cross sections are smeared over a Maxwell Boltzmann distribution of initial electronic energies in order to obtain the free free cross section. The results are in approximate agreement with the familiar classical Kramers result for an effective $\bar{Z}$ of 0.31. (Author)

Tennessee U., Knoxville.
THE INFRARED SPECTRUM OF HCOF AND DCOF, by Roy F. Stratton, Jr. (Doctoral thesis) and Alvin H. Nielsen. Technical rept. no. 4 on Contract DA 33-008-ORD-1166. 5 Dec 57, 169p. 17 refs. OOR rept. 1505.6; AD-150 592.
Order from LC mi$7.80, ph$25.80 PB 147 862

The absorption spectra of formyl fluoride (HCOF) and deutro-formyl (DCOF) were studied in the gaseous state in the IR region. The gases were studied at room temperature which is essentially in the ground electronic and vibrational state. Nine bands were observed in HCOF and 13 in DCOF. A rotational analysis was completed on 5 of the fundamental bands in each molecule. The moments of inertia were used to determine the approximate position of the H atom. The band centers were used to determine some of the vibrational constants.

Optics

OPTICAL IMAGE FORMATION IN TERMS OF ENTROPY TRANSFORMATIONS, by E. L. O'Neill and T. Asakura. Final rept. on Contract AF 49(638)577. Apr 60, 34p. 20 refs. Itek P-163; AFOSR-TR-60-63.
Order from LC mi$3.00, ph$6.30 PB 147 851

The intimate relationship of the theory of partial coherence, the matrix approach to image formation, and the application of Communication and Information Theory to optics are presented. It is shown that both matrix and communication approaches flow natural from E. Wolf's general theory of image formation in terms of the mutual coherence function. The matrix and communication approaches themselves are closely related. New results are also presented from both a geometric and physical optics point of view showing the change in entropy loss as a function of focal position. The arguments presented are confined to the case of quasi-monochromatic illumination. (Author)

Lockheed Aircraft Corp., Sunnyvale, Calif.
THE DIFFRACTION OF RADIATION BY INHOMOGENEOUS LENSES, by Calvin H. Wilcox. 15 Aug 58, 92p. 15 refs. LMSD-5126.
Order from LC mi$5.40, ph$15.30 PB 147 665

The present method is both a generalization and a refinement of the traditional geometrical optics method. The new features of the method are (1) The approximations are deduced directly from the rigorous mathematical formulation of the problem starting with Maxwell's equations. (2) The vector nature of the field, and the associated polarization phenomena, are preserved in the present approximations. (3) Approximations are obtained for the field at any point in space, including those in the "shadow" region of classical geometrical optics (i.e., points that are reached by no light rays).

Massachusetts U., Amherst.
A PHOTOGRAPHIC METHOD FOR THE STUDY OF LIGHT SCATTERED FROM POLYMER FILMS AT SMALL ANGLES, by Alphonse Plaza and Richard S. Stein. Technical rept. no. 13 on Contract Nonr-2151(00). 1 Aug 59, 10p. 10 refs. AD-225 702.
Order from LC mi$1.80, ph$1.80 PB 148 137

An apparatus is described for measuring the scattering of light from films of high polymers at angles of 0^0 to 10^0 from the incident beam. The spherulites in polyethylene films are in such a size range that the scattering technique is of value in determining their size, properties, and internal structure. Light from an arc source is rendered parallel with a lens and a pinhole system and monochromatic with filters. A shutter and iris diaphragm serve to define the beam. A polaroid polarizer and analyzer may be inserted when polarization studies are desired. Collimation of the incident beam is such that scattered light down to about 0.3^0 from the incident beam may be resolved. A maximum in scattering occurs at an angle of about 1.8, and there is a rapid decrease in scattering with increasing angle.

A SYSTEMATIC CALCULATION OF ELASTIC-PLASTIC DEFORMATION OF FRAMES AT IMMINENT COLLAPSE, by Hishashi Tanaka. Technical rept. no. 49 on Contract Nonr-562(10). Aug 59, 50p. 7 refs. Rept. C11-49; AD-226 257.
Order from LC mi$3.30, ph$7.80 PB 147 708

A systematic calculation is shown to estimate the deformation of a frame when plastic collapse is imminent. The method proposed in this paper is convenient in the case of overcomplete collapse as well as in the other cases. (Author)

Carnegie Inst. of Tech., Pittsburgh, Pa.
THEORY OF BLOCH ELECTRONS IN A MAGNETIC FIELD: THE EFFECTIVE HAMILTONIAN, by Walter Kohn. Technical rept. no. 6 on Contract Nonr-760(13). [1959] 69p. 23 refs.
Order from LC mi$3.90, ph$10.80 PB 146 184

The Hamiltonian of a Bloch electron in a static magnetic field is $H = \frac{1}{2}\underset{\sim}{p}^2 + V(\underset{\sim}{r})$, where $V(\underset{\sim}{r})$ is the periodic potential, $\underset{\sim}{P} = \underset{\sim}{p} + \frac{1}{c}\underset{\sim}{A}$, and $\underset{\sim}{A}$ is the vector potential giving rise to the magnetic field $\underset{\sim}{\mathcal{H}}$. We consider the case of a non-degenerate band m. It is then shown that, with an error vanishing with $\mathcal{H}$ like $\mathcal{H}^{N+1}$ (N arbitrary), the eigenstates of H can be calculated from an equivalent Hamiltonian $\overline{H}_m(\underset{\sim}{P})$.

RESEARCH ON GROWING OF CADIUM SULFIDE FOR DOSIMETER PURPOSES, by W. E. Medcalf, K. E. Bean, and J. E. Powderly. Quarterly rept. no. 1, 17 Apr-17 July 57, on Contract DA 36-039-sc-73270. [1957] 56p. 24 refs.
Order from LC mi$3.60, ph$9.30 PB 137 662

Single crystals of cadmium sulfide 10 mm x 10 mm x 25 mm were prepared by sublimation-recrystallization of cadmium sulfide with crystal growth occurring on a polished clear quartz plate. Dark resistivities of the crystals ranged from 25 thousand ohm-centimeters to 140 million ohm-centimeters. In ten runs cadmium sulfide was doped with indium sulfide (In_2S_3) in amounts ranging from .02 to .055 percent by weight of the cadmium sulfide.

RESEARCH ON GROWING OF CADMIUM SULFIDE CRYSTALS FOR DOSIMETER PURPOSES, by J. E. Powderly and K. E. Bean. Quarterly rept. no. 4, 17 Apr 58, on Contract DA 36-039-sc-73270. [1958] 46p.
Order from LC mi$3.30, ph$7.80 PB 137 647

Studies were made of the growth of cadmium sulfide in alumina tubes. The two crystals having the best properties from the standpoint of gamma ray detection had a silicon concentration of 10 to 20 parts per million which is less than the normal concentration. The presence of a small amount of either zinc or silver improved the seeding characteristics of the cadmium sulfide. Cadmium sulfide crystals of high resistivity gave better and more reproducible response to gamma rays when the sample was electroded parallel to the growth axis. (See also PB 137 660)

Georgia Inst. of Tech. Engineering Experiment Station, Atlanta.
INVESTIGATION OF METHODS FOR MEASURING THE EQUIVALENT ELECTRICAL PARAMETERS OF QUARTZ CRYSTALS, by Samuel N. Witt, Jr. and Vance Keith Woodcox. Final rept. for 15 Oct 57-14 Oct 58 on Contract DA 36-039-sc-74948, [1958] 123p. AD-212 021.
Order from LC mi$6.30, ph$19.80 PB 148 105

The major developments were concerned with improving the Crystal Measurements Standard System. A new General Radio Admittance Meter was obtained for use with the Standard. Two commercial chain amplifiers were added to the Crystal Measurements Standard to provide isolation and signal gain between the signal generator and Admittance Meter, and between the frequency measuring equipment and the Admittance Meter. The original mixer, i-f amplifier, and local oscillator null detection system was replaced by an Eddystone UHF Receiver to improve the null detection sensitivity. A simplified crystal measurement method, known as the equivalent Circuit Crystal Measurement Method, was developed mathematically. The crystal Measurements Standard System was used to measure the holder and overtone responses of approximately 25 VHF quartz crystals.

Hoffman Electronics Corp., El Monte, Calif.
INVESTIGATION OF LARGE AREA SOLAR CELLS UTILIZING SPHERES OF SILICON, by Eugene L. Ralph and Heinz F. Biekofsky. Technical summary rept. no. 1, 1 Oct-31 Dec 59, on Contract DA 36-039-sc-85243. [1959] 48p. 3 refs.
Order from LC mi$3.30, ph$7.80 PB 148 111

Theoretical analysis and experimental tests indicate, that the preparation of photovoltaic energy converters several square feet in area is possible by using a composite of a multitude of intimate individual cells, prepared from spheres of semiconducting material. Investigations were started to determine the optimum performance of this type device and to determine the parameters on which it is dependent. Sphere arrangements intercepting 98% of the incident light were prepared. Geometrical-optical factors studied are sphere arrangement, sphere size and spacing, and effects due to reflections from the meniscus around the sphere. A theoretical analysis of a honeycomb lens system shows capabilities of achieving 100% light utilization with loose packing of spheres. Preliminary electrical tests show present efficiencies in the 3 to 5% range with improvements expected. (Author)

GENERALIZATION OF THE THEORY OF THE ISOTHERMAL BLEACHING OF F-CENTERS IN X-RAYED ALKALI HALIDES, PART A [and] ELECTRON MICROSCOPY EXAMINATION OF TRACKS OF FISSION PRODUCTS IN MICA CRYSTALS, PART B, by Guido Bonfiglioli, Peiro Brovetto and others. Final rept. on Contract AF 61(514)1333. Mar 60, 40p. 7 refs. AFOSR-TR-60-67.
Order from LC mi$3.00, ph$6.30 PB 147 500

This report completes the previous note on the theory of the isothermal bleaching of F Centers in X-rayed alkali halides. The calculations are developed in a more general way; an iteration procedure is introduced to improve the accuracy of the solution; the solution used in comparing theory to experiment is justified, showing that it does not change appreciably after a further iteration step. The report also deals with some experiments intended to clear the information which electron microscopy could offer in problems concerning the effect of fast particle irradiation of non metallic crystals. The tracks are essentially cylindrical thermal spikes of a diameter consistent with the theoretical estimates. The peculiar dashed aspect of some tracks is discussed and related to interference contrast effects or possibly incipient annealing. (See also PB 145 681)

IMPLICATIONS OF PARITY NONCONSERVATION AND TIME REVERSAL NONINVARIANCE IN ELECTROMAGNETIC INTERACTIONS. PART II. ATOMIC ENERGY LEVELS, by M. Sachs, and S. L. Schwebel. Technical rept. July 59, 59p. 18 refs. LMSD-49760; AD-227 949.
Order from LC mi$3.60, ph$9.30 PB 147 678

It was pointed out previously (Annals of Physics, 6:244, 1959) that the premises of Lorentz and gauge invariance in electromagnetic interactions are consistent with a theory which violates both parity conservation and time reversal invariance through a symmetrization of these interactions in terms of the electric and magnetic field variables. Such a symmetrization enlarges the class of scalar interaction terms to include corresponding pseudoscalar terms in the interaction Hamiltonian operator. The existance of such interactions in nature has not thus far been established. The purpose is to explore the implications of the existence of these interaction terms in a variety of different physical situations involving the interactions of charged particles. The implications of this theory is derived with regard to the properties of atoms and their associated spectra. (Author)

HARTREE-FOCK ATOMIC SCATTERING FACTORS FOR THE NEUTRAL ATOM IRON TRANSITION SERIES, by A. J. Freeman and R. E. Watson. Apr 60, 13p. 20 refs. MRL rept. no. 74.
Order from LC mi$2.40, ph$3.30 PB 146 399

Atomic scattering factors for the lowest neutral atom $3d^{n-2}\ 4s^2$ states have been calculated for the atoms Ti through Zn using recently computed Hartree-Fock analytic wave functions for the ground state of the atom. Also given are tabulations of the individual transforms for the 3d and 4s electrons. The results are compared with previous calculations for these atoms and the effect of the 4s electrons on the form factors of the 3d and core electrons is discussed. (Author)

CONDENSATION COEFFICIENTS FOR SILVER, CADMIUM AND ZINC IN ULTRAHIGH VACUA, by R. A. Rapp, J. P. Hirth, and G. M. Pound. Technical rept. no. 2 on Contract Nonr-760(17). 18 Aug 59, 88p. 58 refs. AD-226 229.
Order from LC mi$4.80, ph$13.80 PB 147 722

A condensation coefficient of unity has been determined for silver at high fluxes over a temperature range of 45°C to 440°C and at residual gas pressures ranging from 10^{-4} to 6 x 10^{-10} mm Hg. Condensation coefficients of unity have been established for Zn at 68°C and Cd at 18°C in ultrahigh vacuum. The adsorption of gaseous impurities at residual gas pressures of 10^{-4} mm Hg did not affect the condensation coefficient of cadmium at 23°C for condensation at high fluxes. (Author)

PARAMAGNETIC RESONANCE IN THE SOLID STATE, by Hartmut Kallmann. Quarterly rept. no. 6, Oct-Dec 59, on Contract DA 36-039-sc-78056. Feb 60, 7p.
Order from LC mi$1.80, ph$1.80 PB 147 931

Instrumental equipment has been improved with respect to sensitivity. Investigation of the radiation chemistry of benzene-carbon tetrachloride mixtures has been continued. The number of free radicals produced by ionizing radiation is determined by the decrease in the concentration of diphenylpicrylhydrazyl as detected by EPR. The presence of trapped electrons in zinc sulfide phosphors is now investigated at low temperatures. Early results indicated that no increase in number of unpaired electron spins occurred at low temperature. The effect is to be studied under conditions more favorable for the trapping of electrons. RESEARCH INVESTIGATION OF RADIATIVE RECOMBINATION AND LIFETIME IN SEMICONDUCTORS, by C. V. Bocciarelli. Final rept., 1 May 57-30 Apr 58, on Contract NObsr-72695. [1958] 31p. 7 refs. Philco no. H-2126; AD-207 055.
Order from LC mi$3.00, ph$6.30 PB 148 032

The radiation recombination from germanium was found to be the result of direct band to band hole-electron recombination. Optical injection experiments demonstrated that this radiation depends on injected carrier densities. Measurements of the recombination radiation from germanium diodes showed that the intensity of radiation, U, follows a power law $U\ I^a$ where a, a constant for a given sample, varies between 1.2 and 1.6 for different diodes. The peak of the radiation corresponds to an energy of 0.70 ev for both electrically and optically induced radiation. Experiments on optically excited indium antimonide showed no radiation that could be attributed to recombination. The luminescent radiation emitted from activated cadmium sulphide excited by blue or ultraviolet light can be accurately controlled (modulated) by the application of very low AC or DC fields. When the cadmium sulphide is insulated from the field plates, the percentage modulation is very small. When the cadmium sulphide is in electrical contact with the field

plates, the percentage modulation is large and is proportional to the intensity of the excitation. The recombination radiation from cadmium selenide and from red fluorescent cadmium sulphide (in the visible region) can be modulated in a similar way.

RESEARCH ON PARAMAGNETIC RESONANCES, by M. W. P. Strandberg and R. L. Kyhl. Quarterly progress rept. no. 8, 15 May-15 Aug 59, on Contract DA 36-039-sc-74895. [1959] 20p. 4 refs. AD-228 372.
Order from LC mi$2.40, ph$3.30 PB 147 970

The saturation of a paramagnetic-spin system by 13-mc phonons was studied as a function of the paramagnetic-spin resonance frequency. Both frequency-dependent and frequency-independent effects are reported. A preliminary comparison is made of the ratio of the specific paramagnetic ion density to the average paramagnetic ion density in flame-fusion and hydrothermally grown ruby. No significant differences were observed. A modification to the Bloch equations is proposed. This modification is based on recent analytical results. A short description of a unidirectional amplifier formed from a cascade of regenerative cavities is presented. (Author)

SEMICONDUCTING PROPERTIES OF BORON, by Vincent P. Jacobsmeyer, Frank L. Gebhart, and Edward F. Juenke. Final technical rept. for 1 Feb 57-31 Jan 58 on Contract DA 23-072-ORD-1101. [1958] 61p. 39 refs. OOR rept. 1845.1; AD-156 536.
Order from LC mi$3.90, ph$10.80 PB 147 866

Growth of B single crystals by recrystallization methods: Attempts were made to grow B crystals by a solid state transformation process. A study was made of the depositional forms of B by means of x-ray diffraction patterns. Patterns were obtained for representative samples deposited in the 550° to 1500°C range; at least 2 crystalline forms of B were clearly indicated. Samples deposited in the range from 772° to 125°C were subjected to heat-treatment. The crystalline structure of the B specimen was independent of the method of cooling after the heat-treatment. Recrystallization in the higher temperature phase was studied in a single specimen at 1482°C. An x-ray transmission pattern obtained after cooling was identical to a pattern obtained from a typical 1500°C deposit. AC apparatus: The apparatus was constructed around a feedback amplifier with a gain of the order of 10^5 and a bandwidth of 2 c centered about 24 c. The apparatus was tested on Ge; it detected a large signal from this material.

Stanford Electronics Labs., Stanford U., Calif.
STUDIES OF MICROPLASMAS AND HIGH-FIELD EFFECTS IN SILICON. Quarterly status rept. no. 1, 15 Feb-15 May 59 on Contract DA 36-039-sc-78272. [1959] 10p. 2 refs. AD-226 660.
Order from LC mi$1.80, ph$1.80 PB 146 272

Research is reported, having as its objective the study of microplasmas in silicon and related effects. Hot electrons in silicon are to be studied, since the technology of this material is under good control and the effect is present to a fairly strong degree. The preparation of appropriate silicon specimens was accomplished by the diffusion of boron into silicon. A limited degree of success was achieved and the system is described in detail. Basically, an open tube system is used to establish a neutral atmosphere. Contained within this atmosphere is a quartz box which maintains a separate atmosphere. A neutral atmosphere is important since there is leakage between the two atmospheres. A basic experiment relating directly to the behavior of electrons in high fields is being conducted on photoelectric emission of electrons from the conduction bands. Work is also underway to fabricate devices for the high field studies.

Stanford Electronics Labs., Stanford U., Calif.
STUDIES OF MICROPLASMAS AND HIGH-FIELD EFFECTS IN SILICON. Quarterly status rept. no. 2, 16 May-15 Aug 59, on Contract DA 36-039-sc-78272. [1959] 35p. 1 ref. AD-231 563.
Order from LC mi$3.00, ph$6.30 PB 147 932

Progress is reported in the following areas: device techniques, experimental techniques for studying hot electrons, and a study of hot electrons in silicon by photoemission. Discussions are appended on (1) an expression for the total photoelectric current, and (2) the effect of field and photoelectric emission of a hot electron.

Stanford Electronics Labs., Stanford U., Calif.
STUDIES IN MICROPLASMAS AND HIGH-FIELD EFFECTS IN SILICON. Quarterly status rept. no. 3, 16 Aug-15 Nov 59, on Contract DA 36-039-sc-78272. [1959] 14p. 1 ref.
Order from LC mi$2.40, ph$3.30 PB 147 933

An apparent correlation has been observed between surface imperfections and the breakdown phenomenon. Two methods for observing the nature of the imperfections are being considered. An experiment is described which is designed to investigate electron distribution in the conduction band of n-type silicon. (See also PB 147 932)

Stanford U., Calif.
PARAMAGNETIC RELAXATION IN SOLUTIONS OF VO^{++}, by R. N. Rogers and G. E. Pake. Technical note no. 4 on Paramagnetic Resonance, Contract AF 18(603)131. Apr 60, 21p. 15 refs. AFOSR-TN-60-429.
Order from LC mi$2.70, ph$4.80 PB 147 741

The ESR spectrum of vanadyl ion in solutions has the interesting feature that the linewidths of the individual hyperfine components depend on the nuclear spin orientation, m_I. We have determined that the origin of the effect is the mechanism proposed by H. M. McConnell, namely, that the existence of a "microcrystal" about the VO^{++} ion which gives rise to anisotropies in the g-tensor and hyperfine interaction. By comparing the results of linewidth measurements made at 9.25 kmc and at 24.3 kmc with the results of calculations made by D. Kivelson, we were able to conclude the validity of the microcrystallite model. (Author)

THE EPITAXIAL GROWTH OF HEXAGONAL SILICON CARBIDE ONTO SEEDS, by Karl M. Hergenrother. Scientific rept. no. 2 on Contract AF 19(604)4989. 1 Apr 60, 18p. 6 refs. AFCRC-TN-60-372.
Order from LC mi$2.40, ph$3.30 PB 147 769

It has been found possible to grow single crystal epitaxial films of silicon carbide from the vapor phase onto a silicon carbide seed. These crystals are grown in a specially designed furnace which is capable of reaching 2800°C, is vacuum tight and clean enough to permit the control of the resistivity and type of film grown. Details of the furnace design and operation are discussed. The various parameters which control the properties of the films are discussed. (Author)

Wayne State U., Detroit, Mich.
1/f NOISE IN SINGLE-CRYSTAL GERMANIUM FILAMENTS, by V. E. Noble and J. E. Thomas, Jr. Technical note no. 4 on Contract AF 49(638)158. 1 Mar 60, 113p. 84 refs. AFOSR-TN-60-311.
Order from LC mi$6.00, ph$18.30 PB 147 774

The variation of 1/f noise in germanium filaments as a function of the surface potential has been investigated by varying the gaseous ambient surrounding the noise sample. Noise measurements on 32 ohm cm n-type, 8.5 ohm cm n-type, and 9 ohm cm p-type material showed a definite noise minimum when the value of the surface potential corresponded with the sample conductance minimum. Noise amplitude calculations, based on McWhorter's majority carrier trapping effect, were within a factor of two of the observed accumulation-layer noise observed in the case of the near-intrinsic material. The inversion-layer noise was greater than both the predicted value and the observed accumulation-layer noise.

Westinghouse Research Labs., Pittsburgh, Pa.
ELECTRON-SPIN-LATTICE RELAXATION IN DILUTE POTASSIUM CHROMICYANIDE AT HELIUM TEMPERATURES, by J. G. Castle, Jr., P. F. Chester, and P. E. Wagner. Rept. for 2nd quarter on Contract AF 19(604)5589. 7 Mar 60, 42p. 37 refs. Research rept. 403FD449-R4; AFCRC-TN-60-179.
Order from LC mi$3.30, ph$7.80 PB 147 303

Measurements have been made of the electron spin lattice relaxation of the - 1/2, + 1/2 line of Cr^{+++} in $K_3Co(CN)_6$ at 9 KMc/sec as a function of temperature, chromium concentration, and the proximity of the - 3/2, - 1/2 line. The experimental procedure, involving inversion of the line, is capable of distinguishing a "bottleneck" relaxation time from a true spin-phonon relaxation time, T_1. At Cr^{+++} concentrations up to 0.5 per cent, the relaxation data are fitted well by single exponential functions of time. Between 1.3°K and 4.8°K, T_1 varies approximately at $T^{-1.2}$ indicating

that the single phonon process is dominant. No phonon-bath bottleneck is observed, in agreement with calculations based on the measured parameters. A "proximity effect" is observed in which the relaxation rate of the - 1/2, + 1/2 line is enhanced when the - 3/2, - 1/2 line is within 20 linewidths. At one per cent Cr^{+++}, the relaxation behavior is markedly different: the recovery is considerably faster and can no longer be described by a single time constant. This change and the proximity effect are interpreted qualitatively in terms of spin cross relaxation. The measured linewidth increases with concentration from 0.03 per cent to 2 per cent Cr^{+++}, even though the line is observed to be inhomogeneous at and below 0.5 per cent Cr^{+++} (Author)

CONTRIBUTIONS TO THE THEORY OF PARTIAL COHERENCE, by George B. Parrent, Jr. (Victoria U. of Manchester). Doctoral thesis. Mar 60, 106p. 53 refs. AFCRC-TR-60-124.
Order from LC mi$5.70, ph$16.80 PB 147 645

A brief survey of previous developments in the theory of partial coherence is given in Chapter 1 and the relations between the complex degree of coherence (see Wolf 1955) and the measures of coherence introduced by earlier authors are given. Coherence theory is formulated in terms of correlation functions and analytic signals and the developments of this thesis required several new theorems concerning the convolution and cross-correlation of analytic signals. These theorems are developed in Chapter 2. In Chapter 3 these theorems are applied to the detailed analysis of the limiting forms of the mutual coherence function for both polychromatic and quasi-monochromatic fields. In Chapter 4 the propagation of mutual coherence is studied. The results of the previous chapters are applied in Chapter 5 to a frequency domain analysis of the optical imaging problem.

PROCEEDINGS OF SYMPOSIUM ON THE PLASMA SHEATH 7-9 DECEMBER 1959, VOLUME 1. [1960] 228p. 73 refs. AFCRC-TR-60-108(I).
Order from LC mi$9.90, ph$34.30 PB 147 639

This initial Symposium was directed toward bringing together those people interested in the Plasma Sheath problem as it affected communication to and from a plasma sheathed hypersonic vehicle and the detection of this vehicle by radar techniques. The proceedings have been divided among three publications. Pergamon Press will publish 20 of the unclassified papers in book form available to the public. This publication includes 8 additional unclassified papers. AFCRC-TR-60-108-II will contain 5 Classified papers. To assist the reader both AFCRC publications will include a table of contents listing the papers in all three publications and a copy of all unclassified abstracts. (Author)

BIBLIOGRAPHY ON MAGNETOHYDRODYNAMICS, PLASMA PHYSICS, AND CONTROLLED THERMONUCLEAR PROCESSES, by Barbara A. Spence. Oct 59, 101p. 1562 refs. AMP 36; AD-233 709.
Order from OTS $2.50 PB 161 825

Reference sources for the bibliography included Physics Abstracts; Nuclear Science Abstracts; Mathematical Reviews; Technical Translations, and U.S. Government Research Reports, published by the Office of Technical Services of the Department of Commerce; the Armed Services Technical Information Agency's Technical Abstract Bulletin, reference lists published in conference proceedings, publishers' catalogs, publications lists which we received from several agencies performing work in these fields, and recent issues of certain journals themselves. References are included to books, reports, conference proceedings and papers published in the open literature between 1925 and September, 1959. Books and journal articles are listed under the name of the first author. Reports are referenced under the name of the issuing agency. The name of each author of a report is included in the Author Index, so that, by using the Author Index, the user can quickly locate all references to work of a single author.

Electrical Engineering Research Lab., U. of Illinois, Urbana.
INVESTIGATION OF MICROWAVE DUPLEXER SWITCHING MECHANISMS, by A. Aharoni, K. Rose, and S. Takeda. Quarterly progress rept. no. 1, 1 Mar-31 May 59, on Contract DA 36-039-sc-78313. [1959] 46p. 8 refs. AD-229 822.
Order from LC mi$3.30, ph$7.80 PB 148 109

Optical and microwave measurements of shock wave phenomena in gases excited by ultra fast-high energy electrical discharges are reported. Special microwave techniques have been developed to measure the electron density and collision frequency. Difficulties were encountered in separating the shock wave from the "blow down" plasma. An analysis of second harmonic effects in semiconductors was completed. Further investigation proved that the extra pulse effect could be attributed to the influence of the magnetron second harmonic output power. Work was initiated to extend the "hot electron" effect to higher and lower semiconductor conductivities. Microwave transmission measurements through TE mode semiconductor filled cavities are reported. (Author)

INVESTIGATION OF MICROWAVE DUPLEXER SWITCHING MECHANISMS, by A. Aharoni, K. Rose and others. Quarterly progress rept. no. 2, 1 June-31 Aug 59, on Contract DA 36-039-sc-78313. [1959] 40p. AD-232 124.
Order from LC mi$3.00, ph$6.30 PB 148 110

Experiments on the production and study of shock waves of moderate strengths, in gaseous discharges, were continued. A new method of determining the various characteristics of these shock fronts was developed. Research on semi-conductor behavior in high level microwave fields was continued using resonant cavity techniques at 8-mm wavelengths. ILLIAC computations have been completed to determine the resonance conditions for a high resistivity semiconductor sample in a TM_{011} mode cylindrical cavity of circular cross section. The results of these calculations have been compared with those based on an impedance-matching technique, thereby confirming and extending them. In addition, an improved method has been developed for relating the parameters of the cavity to the experimental measurements using equivalent circuit concepts. Preliminary measurements have been made on the TM mode cavity with high conductivity and high resistivity samples. The high conductivity samples are found to interact more strongly with the microwave field than was the case with the TE mode cavity. (Author) (See also PB 148 109)

INVARIANT COMMUTATORS FOR THE QUANTIZED GRAVITATIONAL FIELD, by Bryce S. DeWitt. Rept. on Contract AF 49(638)563. Jan 60, 24p. 11 refs. Publication no. 6; AFOSR-TN-60-87; AD-233 367.
Order from LC mi$2.70, ph$4.80 PB 146 949

The difficulties encountered in applying quantum mechanics to Einstein's theory of gravitation are twofold: (1) the nonlinearity of the theory, and (2) its coordinate invariance, which leads to constraints on the Cauchy data for the dynamical equations. These difficulties are shown not to be so severe, and the basic commutators of the theory are displayed in co-variant form. The commutators are approached through the canonical theory of Poisson brackets to emphasize the applicability of the results to classical and quantum theory. The derivations are based on the recognition of the action as the generator of a finite canonical transformation and on the use of the fundamental theorem of classical transformation theory; the variation in the functional form of the generator of a finite canonical transformation, due to independent infinitesimal canonical transformation of its arguments is equal to the difference of the associated independent infinitesimal generators.

DISTRIBUTION FUNCTIONS AND QUANTUM STATISTICS, by Robert Ayres. [Rept. on Contract AF 49(638)399]. May 60, 46p. 19 refs. Dept of Physics Technical rept. no. 179; AFOSR-TN-60-522.
Order from LC mi$3.30, ph$7.80 PB 147 937

A new formulation of quantum statistical mechanics is given, in terms of distribution functions. It is shown that all quantities of interests are obtained directly from the distribution of particles in k-space, $n(\vec{k}, \beta)$ and the reaction operator K (often called the Brueckner K-matrix) which is familiar from stationary-state many-body perturbation theory. An integral equation for $n(\vec{k}, \beta)$ is found, which can be solved by a converging iteration process. Some remarks are included on the application of the virial theorem to systems characterized by zero pressure. (Author)

THE ZERO-POINT ENERGY OF AN ELECTRON LATTICE, by Alexei A. Maradudin (Inst. for Fluid Dynamics and Applied Mathematics) and Rosemary A. Coldwell-Horsfall. [Rept. on Contract AF 49(638)24.] May 60, 36p. 23 refs. Technical rept. no. 177; AFOSR-TN-60-446.
Order from LC mi$3.00, ph$6.30 PB 147 739

At very low densities an electron gas in a compensating uniform background of positive charge crystallizes into a body-centered cubic lattice for which the correlation energy per electron is $(-1.792/r_s)$ Ry. At higher densities the first correction to this result arises from the zero-point energy of the electrons, which can be expanded in terms of the even moments of the frequency spectrum. We have computed the first five non-vanishing moments and have estimated the contribution to the zero-point energy from the remaining moments using their known asymptotic behavior. This procedure leads to the value $(2.638/r_s^{3/2})$ Ry. for the zero-point energy per electron. The low temperature specific heat per electron is found to be $56.21\ k\ r_s^{9/2}.(kT)^3$Ry. The range of r_s values for which these results should be valid is discussed on the basis of Lindemann's melting formula. (Author)

Microwave Lab., Stanford U., Calif.
GENERALIZATION OF THE LAGRANGE EXPANSION, WITH APPLICATION TO PHYSICAL PROBLEMS, by P. A. Sturrock. Scientific rept. no. 18 on Contract AF 19(604)1930. Dec 59, 15p. 6 refs. M. L. rept. no. 668; AFCRC TN-60-117; AD-233 866.
Order from LC mi$2.40, ph$3.30 PB 146 326

Problems of fluid dynamics are discussed in the Lagrangian description by means of the displacement-vector function. The Eulerian variables describing the motion may be obtained from the displacement-vector function by a generalization of the Lagrange expansion which is established. Two examples of the application of this expansion are given: the derivation of the Fokker-Planck equation, and the description of the surface conditions of a rippling electron stream by the device of equivalent surface charges. STARK BROADENING OF HYDROGEN LINES IN PLASMA, by H. R. Griem, A. C. Kolb, and K. Y. Shen. 4 Mar 60, 26p. NRL rept. 5455.
Order from LC mi$2.70, ph$4.80 PB 144 638

The frequency distributions of hydrogen lines broadened by the local fields of both ions and electrons in a plasma are calculated in the classical path approximation. A complete set of curves is presented for electron densities in the range 10^{14} to 10^{19} cm^{-3} for the temperature range 10,000°K to 40,000°K.

Polytechnic Inst. of Brooklyn, N. Y.
ELECTRON DISTRIBUTION ACROSS A DISCONTINUITY OF ION DENSITY IN A PLASMA, by Manlio Abele. Rept. on Contract AF 30(602)2045. Mar 60, 16p. 2 refs. PIBAL rept. no. 549; RADC-TN-60-77.
Order from LC mi$2.40, ph$3.30 PB 146 769

The problem of the electron distribution in the vicinity of a discontinuity of ion density is discussed in the present report, assuming that a plane infinite surface separates a uniform plasma from a vacuum. The density of electrons in the vacuum is always very small compared to the ion density of the plasma. The results indicate that the electron density vanishes at large distance from the interface with a rate of decrease which is small compared to the rate of change of the electron density within the plasma. (Author)

Republic Aviation Corp. [Farmingdale, N. Y.]
AN OUTLINE OF THE BASIC THEORY OF MAGNETOHYDRODYNAMICS, by P. N. Hu. Technical rept. on Contract AF 29(601)1218. 15 Nov 58, 60p. 30 refs. MSD Rept. no. 206-950-2; AFSWC-TR-58-46; AD-208 851.
Order from LC mi$3.60, ph$9.30 PB 146 108

A survey of the basic theory of magnetohydrodynamics is given together with a review of the fundamental concepts of electrodynamics and the motion of a charged particle. The basic equations used for a viscous, heat-conducting, radiating, electrically-conducting, and compressible fluid are the Maxwell's equations, the momentum equation, the continuity equation, the ideal gas law, the energy equation, and Ohm's law. The most general form of these equations is derived and then reduced to various approximate forms. The associated boundary conditions for the electric and magnetic fields, pressure, velocity, and heat energy are also derived. Solutions to several problems are noted. (Author)

INVESTIGATION OF HIGH FREQUENCY LIMITATIONS IN MILLIMETER WAVE GENERATORS, by Julian Schwinger. Final rept. for Aug 59-Feb 60 on Contract DA 36-039-sc-78282. [1960] 38p. 7 refs.
Order from LC mi$3.00, ph$6.30 PB 147 983

Need of a quantum-mechanical formalsim for systems with dissipation, applicable to the radiation field of a cavity, is discussed. Approximations with respect to loss mechanism which underlie the concept of dissipation are discussed. A generalization of the solution, to provide for a classical driving force and coupled atomic systems, is given. (Author)

Space Sciences Lab., General Electric Co., Philadelphia, Pa.
PLASMA SHEATH CHARACTERISTICS ABOUT HYPERSONIC VEHICLES, by H. G. Lew and V. A. Langelo. Rept. on Contract AF 04(647)269. 6 Apr 60, 49p. 7 refs. Technical Information Series R60SD356.
Order from LC mi$3.30, ph$7.80 PB 147 636

This paper considers vehicle induced interferences to signal transmission and presents some results for a typical re-entry body. The shock layer for such a body is investigated including the effects of non-equilibrium. The ionized wake behind the body is discussed for both the continuum and rarefied gaseous states. Finally, an estimate of the attenuation of a plane wave through the ion sheath is given. (Author)

Air Force Special Weapons Center, Kirtland AFB, N. Mex.
THERMODYNAMIC PROPERTIES OF AIR AT HIGH TEMPERATURES, by James E. Weidenborner. Dec 56, 66p. 8 refs. AFSWC-TN-56-48; AD-96 301.
Order from LC mi$3.90, ph$10.80 PB 148 280

This report presents, in graphical form, a number of thermodynamic properties and shock parameters based upon a new equation of state for air computed by the National Bureau of Standards. Isotherms, adiabats, and shock-front parameters at varying altitudes for air were computed from the NBS equation of state data, which is also included in this report, and plotted in appropriate graphical form over a wide range of density, pressure, and temperature. A study of the isotherms, adiabats, and shock parameters shows that these curves do not deviate greatly from similar curves obtained by previous investigators using other equations of state for air. The isotherms in this report, however, cover a wider range of density, pressure, and temperature than any set of curves heretofore available. The graphs of shock parameters show that these vary with altitude, not greatly, but in an orderly manner. (Author)

MOLLIER DIAGRAM FOR NITROGEN, by R. L. Humphrey, W. J. Little, and L. A. Seeley. Rept. on ARO, Inc. Contract AF 40(600)800. May 60, 39p. 4 refs. AEDC-TN-60-83.
Order from LC mi$3.00, ph$6.30 PB 147 728

Thermodynamic data for nitrogen are presented in Mollier diagram form covering the temperature range of $30^{o}K$ to 15,000 ^{o}K and the density range of 10^{-6} to 10^{3} atmospheres. (Author)

Little, Arthur D., Inc., Cambridge, Mass.
HIGH TEMPERATURE THERMAL RADIATION PROPERTIES OF SOLID MATERIALS, by Henry H. Blau, Jr., Eleanor Chaffee and others. Scientific rept. no. 2 on Contract AF 19(604)2639. 31 Mar 60, 61p. 7 refs. AFCRC-TN-60-165.
Order from OTS $1.75 PB 161 773

This report describes the first phase of an experimental study of the thermal radiation properties of solid materials at elevated temperatures. The basic objectives of the study have been: (a) to establish techniques for measurement of spectral and total emissivity and emittance of solid materials at temperatures as high as 4000K, (b) to determine the practical accuracy of these techniques, and (c) to determine the thermal radiation characteristics of selected materials of interest.

Polytechnic Inst. of Brooklyn, N. Y.
TEMPERATURE DISTRIBUTION AND THERMAL STRESSES IN STRUCTURES WITH CONTACT RESISTANCES, by Frederick V. Pohle, T. J. Lardner, and Francis W. French. Rept. on Contract AF 49(638)302. May 60, 32p. 22 refs. PIBAL rept. no. 557; AFOSR-TN-60-504.
Order from LC mi$3.00, ph$6.30 PB 147 783

The temperature distribution in a built-up structure in the form of an I-section composed of cover plates and a web is investigated for the case of a contact resistance at the junction of the cover plates and the web. The temperature-discontinuity condition is discussed in the light of previous experimental work, and a new junction condition is proposed. Graphs of temperatures and stresses are presented for the case of constant flux of heat to the cover plates. (Author)

Woods Hole Oceanographic Institution, Mass.
MEASUREMENTS OF RADIATIVE FLUX FROM AN AIRBOURNE RADIOMETER, by David B. Clarke. Technical rept. no. 43 on Marine Meteorology, Contract Nonr-1721(00). Aug 59, 22p. 7 refs. Ref. no. 59-40; AD-226 010.
Order from LC mi$2.70, ph$4.80 PB 148 175

An airborne instrument is described that is being developed to investigate the radiative heat balance in the lower troposphere. The instrument, a radiometer, essentially derives the radiative flux by measuring the temperature on opposite sides of an insulator. The radiometer was mounted on an R4D Naval research airplane on 2 struts trailing from the port wing, and in Nov 1958, was flown from Woods Hole to Trinidad and back. Radiation measurements were obtained along the route but most measurements were obtained in an area about 50 mi east of Trinidad. The radiometer's construction consists of a disc of aluminum foil 2 in. in diameter which acts as the sensor that receives the radiation. A small bead thermistor is sandwiched between the disc's under side and another small piece of aluminum foil to measure the disc's temperature. The bead and the small foil are taped tightly to the larger disc to insure good thermal contact. Results indicate that the radiometer was not too satisfactory. It was too slow in response and not constructed carefully enough to give the desired accuracy needed for net fluxes, flux divergence, and radiative cooling. The radiometer had the advantage of being relatively inexpensive to build and maintain, and of being simple in principle and construction.

Wave Propagation

Institute of Mathematical Sciences, New York U., N. Y.
SCATTERING OF A SURFACE WAVE BY A DISCONTINUITY IN THE SURFACE REACTANCE ON A RIGHT ANGLED WEDGE, by Frank C. Karal, Jr. and Samuel N. Karp. Rept. on Contract AF 19 AF 19(604)5238. Feb 60, 29p. 23 refs. Research rept. no. EM-146; AFCRC-TN-60-196.
Order from LC mi$2.70, ph$4.80 PB 147 526

This report considers the electromagnetic field that arises when a surface wave travels along the front face of a right angled wedge and is scattered by the tip. An impedance type boundary condition is prescribed on the front face of the wedge and a simple boundary condition (that for perfect reflection) is prescribed on the other. The impedance boundary condition is such that surface waves are generated. An exact mathematical solution is presented in elementary form for this problem and the amplitude of the reflected surface wave is found. A simple representation for the radiated far field amplitude is given. The important special cases of small and large reactance are discussed. For large reactance the wave is closely bound to the surface, which may then be regarded as a surface-wave-guide. In this limit there is complete reflection of the surface wave, with a change in phase of $\pi/3$. The question is raised as to what change of phase ought to be assigned, in general, so as to describe reflection at an 'open end' of a surface-wave-guide. (Author)

National Bureau of Standards, Boulder, Colo.
A SURVEY AND BIBLIOGRAPHY OF RECENT RESEARCH IN THE PROPAGATION OF VLF RADIO WAVES, by James R. Wait. May 60, 47p. 326 refs. Technical note no. 58.
Order from OTS $0.75 PB 161 559

Attention is confined primarily to terrestrial propagation, and thus solar and exospheric phenomena are generally excluded although certain germane references dealing with these subjects are given in the bibliography. First a brief description of recent advances of ground wave propagation is given. This is followed by sections on ray and mode concepts of ionospheric propagation. The research dealing with the waveforms of atmospherics is also considered. Finally some recent applications of VLF propagation are described.

Armed Services Technical Information Agency, Arlington, Va.
FIELDS OF INTEREST OF DEPARTMENT OF DEFENSE CONTRACTORS AND OTHER NON-MILITARY ORGANIZATIONS SERVICED BY ASTIA. Sep 59, 216p.
Order from OTS $2.50 PB 161 810

The compilation is based on a special run, in mid-September 1959, of the machine-converted Field-of-Interest Registers in the ASTIA file. These registers show, in some detail, the scientific and technical fields of interest which have been approved for each of the defense contractors and other non-military organizations established to receive ASTIA's service. Part I lists the organizations alphabetically, showing the ASTIA mailing code, which is used here as a cross-reference key. Part II, which is arranged in mailing code sequence, shows the field of interest of each organizations, in the form of a grid of numbers referring to the major divisions and sections of the ASTIA distribution Guide. Part III lists the mailing codes in numerical sequence under each major division, and Part IV gives the names of divisions and sections.

Cornell Aeronautical Lab., Inc., Buffalo, N. Y.
MARK I PERCEPTRON OPERATORS' MANUAL (PROJECT PARA) by John C. Hay, Ben E. Lynch and others. Rept. on Contract Nonr-2381(00). 15 Feb 60, 62p. 6 refs. Rept. no. VG-1196-G-5.
Order from LC mi$3.90, ph$10.80 PB 147 661

The Mark I Perceptron is a pattern learning and recognition device. It is intended as an experimental tool for the direct study of a limited class of perceptrons. This manual is intended primarily as a guide to the setting up and operation of the machine. It does not require extensive familiarity with the theory of perceptron systems. For those familiar with the theory, but not necessarily concerned with actually operating the machine, the manual should serve to indicate the machine's potentialities as a research instrument.

Cornell Aeronautical Lab., Inc., Buffalo, N. Y.
ON THE CONVERGENCE OF REINFORCEMENT PROCEDURES IN SIMPLE PERCEPTRONS, by Frank Rosenblatt. Rept. on Proj. Para, Contract Nonr-2381(00). 15 Feb 60, 58p. 9 refs. Rept. no. VG-1196-G-4.
Order from LC mi$3.60, ph$9.30 PB 148 227

Previous reports have described a number of theoretical nerve nets called perceptrons, and have attempted to analyze their ability to associate responses to stimuli using a variety of training procedures and memory functions. Proofs have been found for a number of theorems of fundamental importance for the theory of such networks. The main findings are summarized: (1) there exist certain simple memory functions and training procedures by which it can be guaranteed that a perceptron will ultimately arrive at a solution to any given response-association problem; (2) a variety of problems are shown to be soluble; (3) the same procedures which yield solutions for binary classification problems can be employed to assign arbitrary response functions to stimuli; and (4) a considerable variety of perceptron models, differing from one another in the transfer functions of their association units, are shown to be identical with respect to their ability to arrive at solutions to learning problems.

Wharton School of Finance and Commerce, U. of Pennsylvania, Philadelphia.
POSSIBLE APPLICATIONS OF ELECTRONIC SCANNING AND COMPUTER DEVICES TO THE ANALYSIS OF GEOGRAPHIC PHENOMENA, by James P. Latham. Technical rept. no. 1 on Contract Nonr-551(29). 31 Aug 59, 27p. 16 refs. AD-227 257.
Order from LC mi$2.70, ph$4.80 PB 148 145

Methods are examined: (1) which analyze the distribution of geographic phenomena by measurement, and thereby provides an objective basis for regionalizing and describing distributions; and (2) to improve the speed, accuracy, utility, and economic feasibility of such methods by applying modern instrumented systems of measurement and data processing. The possibility and present practicability is explored of utilizing electronic scanning devices to measure and record the linear distances of the intercepts resulting when traverses sample a mapped distribution of areal units. Ways and means are developed for recording the above measurements in a manner which will permit the use of mechanical and/or electronic sorting. Computing equipment is investigated for organizing and statistically evaluating the data. (Author)

Communication Theory

Gordon McKay Lab. of Applied Science, Harvard U., Cambridge, Mass.
REPRESENTATION OF COMPLEX SIGNALS BY MEANS OF DAMPED OSCILLATORY BASE FUNCTIONS, by Ladislav Dolansky. Scientific rept. no. 59-1 on Contract AF 19(604)4979. 10 Aug 59, 68p. 53 refs. AFCRC-TN-59-648; AD-232 538.
Order from LC mi$3.90, ph$10.80 PB 146 112

Traditionally, the more complicated communication signals have been most often expressed in terms of Fourier series components or as time functions specified at a large number of points. Such approaches are usually mathematically complete and may be useful in many respects; however, for good insight and simplicity of the associated equipment, they are often inferior to approaches using component functions more directly related to the process which generates the particular class of signals studied. An orthonormal set of decaying oscillatory base functions was obtained and the problem of expressing voiced speech sounds by means of a small number of such functions, and of obtaining their coefficients by measurement, was studied. The experimental results indicate that an analysis of the speech waveform into damped oscillatory base functions and subsequent synthesis within a good approximation is indeed possible. The essential information about each sound can be condensed into a vector or a row matrix, to which all known methods of mathematical analysis can be applied. The method is not limited to speech sounds. It can be applied to other complex experimental signals as well, although for different classes of signals different base functions may be found to be more advantageous. (Author)

Ohio State U Research Foundation, Columbus.
AN EXAMINATION OF THE SPOKEN VOCABULARY USED IN AIR TRAFFIC CONTROL, by Henry M. Moser and Robert E. Durham. Technical rept. no. 55 on Contract AF 19(604)4575. Nov 59, 39p. 13 refs. AFCRC-TN-59-73; AD-233 255.
Order from LC mi$3.00, ph$6.30 PB 146 306

Word counts were made of air traffic communications at three domestic and two international airports located in high-traffic areas in the United States. Consecutive segments of two-way radiotelephones messages were analyzed for type-token ratios. Pilots and controllers use a very limited basic vocabulary. Although there are similarities in the vocabularies employed in tower, Ground Control, and Approach Control, there are characteristic differences. In general, there are more differences between the several control facilities of one airport than among the vocabularies of the same control facility at different airports. (Author)

Speech Research Lab., U. of Michigan, Ann Arbor.
AN ACOUSTIC-PHONETIC STUDY OF INTERNAL OPEN JUNCTURE, by Ilse Lehiste. Rept. no. 2 on Contract Nonr-1224(22). Aug 59, 122p. 166 refs. AD-226 319.
Order from LC mi$6.30, ph$19.80 PB 147 690

The phonetic manifestations of internal open juncture in standard Midwestern American English were explored. Several phonetic factors were observed which indicate the presence of internal open juncture. Internal open juncture can be defined as a boundary point between 2 phonological units in English, here called bounded sequences. A bounded sequence is an ordered set of phonemes that starts with an initial allophone, ends with a final allophone, and possesses a typical intensity and duration pattern which unites the segmental phonemes into the higher-level unit. The various prejunctural and post-junctural allophones are described. The intensity pattern associated with a bounded sequence involves a rapid increase in intensity during the initial phase, followed by a slow decrease associated with deceleration in tempo during the terminal phase.

Naval Ordnance Test Station, China Lake, Calif.
A BASIC STUDY ON IMAGE DEGRADATION RESULTING FROM VIBRATION IN A PHOTOGRAPHIC SYSTEM, by D. R. Hornbaker and R. O. White. 9 Mar 60, 24p. 1 ref. NOTS TP-2440; NAVORD rept. 7048.
Order from LC mi$2.70, ph$4.80 PB 147 491

A study to determine quantitatively the effect of simple harmonic vibration on photographic image resolution was performed. Two primary effects were found: (1) an image shift, and (2) an image smear. The first, not readily predictable, is dependent on frequency and phase as related to the exposure period. The second is readily predictable from a ratio, dependent on film resolution quality, relating image vibration amplitude to image width. (Author)

X-Ray and Crystal Analysis Lab., Pennsylvania State U., University Park.
X-RAY CAMERA FOR USE WITH UNICAM. S25 OSCILLATION GONIOMETER FOR MICROBEAM APPLICATIONS, by K. Drenck and R. Pepinsky Rept. on Contract DA 36-061-ORD-478. [1956] 8p. 3 refs. OOR rept. no. 761.4; AD-143 149.
Order from LC mi$1.80, ph$1.80 PB 14[illegible] 860

A miniaturized single-crystal X-ray diffraction camera was constructed as an attachment for the Unicam . S25 oscillation-rotation goniometer. This camera is designed for use with the high-brilliance micro-focus X-ray diffraction tube.

A STUDY OF THE FUNDAMENTALS OF INFORMATION STORAGE AND RETRIEVAL, by Peter K. Worslet, Roger D. Dittman and others. Final rept. no. 417 on Contract Nonr-2666(00). 20 Aug 59, 99p. 2 refs.
Order from LC mi$5.40, ph$15.30 PB 147 726

The key concept is one of searching for documents not by physically shuffling and moving them to expose for inspection a reference on their surface, but rather one of allowing all of the documents to remain static and subjecting them to a paging or broadcasting system. The basic concept is one of creating a document, or document envelope, which by virtue of a sensitized coding system, would be alert rather than passive, awaiting call from a central interrogation system. It became evident that it was necessary to retreat further toward the fundamentals of Data Banking to increase the understanding of the nature of the intercommunication between human minds through documents. With this new information it was then possible to proceed to work on the technology of creating coded documents with the ability to respond to particular coded call signs. The study has contributed to the understanding of the man-document communication problem and it has contributed towards solving the extremely difficult problem of creating "alert" rather than passive documents.

Center for Documentation and Communication Research, Western Reserve U., Cleveland, Ohio.
MECHANIZED SEARCHING EXPERIMENTS USING THE WRU SEARCHING SELECTOR, by Janet Rees and Allen Kent. Technical note no. 1 on Contract AF 49(638)357. 15 May 58, 31p. 59 refs. AFOSR TN-58-445; AD-158 250.
Order from LC mi$3.00, ph$6.30 PB 146 386

One of the applications of the Western Reserve University Searching Selector is to conduct test searches on a file of encoded abstracts prepared for the American Society for Metals. This report presents typical results of pilot searches. Their evaluation as to pertinent interest and general usefulness has also been carried out by persons and organizations that originated information requests. The results of such evaluation and the procedures involved in making them are also presented. (Author)

Bone marrow activity in vitro under the influence of anemic serum and human erythropoietin, by J. S. Beck. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. May 60. Contract W-7405-eng-48. 7p. Order from OTS. 50 cents. UCRL-9205

Chemistry—General

Study of equilibrium between metals and their polyvalent chlorides in LiCl–KCl eutectic melt, by L. Yang, R. G. Hudson, and C. Chien. Carneg Institute of Tech., Metals Research Laboratory, Pittsburgh, Pa. 1959. 27p. Order from LC. Mi $2.70, ph $4.80. AECU-4544

Production of single crystal copper films at low temperatures. Technical report no. 5, by A. Yelon. Case Institute of Tech., Cleveland, Ohio. Apr 59. Contract AT(11-1)-623. 16p. Order from LC. Mi $2.40, ph $3.30. AECU-4553

Photometric titration of weak bases in nonaqueous media, by L. E. I. Hummelstedt and D. N. Hume. Massachusetts Institute of Tech., Lab. for Nuclear Science, Cambridge, Mass. 1959. Contract AT(30-1)-905. 31p. Order from LC. Mi $3.00, ph $6.30. AECU-4561

Progress report for period covering December 17, 1959 - January 15, 1960. Ionics, Inc., Cambridge, Mass. Jan 60. 4p. Order from LC. Mi $1.80, ph $1.80. AECU-4591

Absorption of organic acids on thoria. Technical report V, by H. R. Bradford and M. E. Wadsworth. University of Utah, Salt Lake City, Utah. Dec 59. Contract W-7405-eng-26. 10p. Order from LC. Mi $1.80, ph $1.80. AECU-4611

The surface chemistry of thoria. Progress report for February 1, 1959 to January 31, 1960, by H. R. Bradford and others. University of Utah, Institute of Metals and Explosives Research, Salt Lake City, Utah. Jan 60. Contract W-7405-eng-

26. 9p. Order from LC. Mi $1.80, ph $1.80. AECU-4612

Final report, January 20, 1948 - September 14, 1959, by D. Lipkin. Washington University, St. Louis, Mo. Contracts AT-29-1-GEN-77 and AT(11-1)-268. 17p. Order from LC. Mi $2.40, ph $3.30. AECU-4614

Properties of hydrided yttrium, by D. S. Parker. General Electric Co. Aircraft Nuclear Propulsion Department, Cincinnati, Ohio. May 60. Contracts AF 33(600)-38062 and AT(11-1)-171. 23p. Order from OTS. 50 cents. APEX-558

Properties of hydrided zirconium, by D. S. Parker, and C. L. Huffine. General Electric Co., Aircraft Nuclear Propulsion Department, Cincinnati, Ohio. Dec 59. Contracts AF 33(600)-38062 and AT(11-1)-171. 38p. Order from OTS. 75 cents. APEX-561

Curves for computation of kinetics isotope effects, by G. A. Ropp. Oak Ridge National Laboratory, Oak Ridge, Tenn. Dec 59. 11p. Order from LC. Mi $2.40, ph $3.30. CF-59-12-4

Rapid two-cycle extraction method for neptunium. Initial separation as neptunium (VI) with methyl isobutyl ketone, by M. C. Elliot and J. E. Rwin. Phillips Petroleum Co., Atomic Energy Div., Idaho Falls, Idaho. Sep 59. Contract AT(10-1)-205. 12p. Order from LC. Mi $1.80, ph $1.80. IDO-14482

Mechanism of electroreduction of chromic ion at the mercury cathode, by M. E. McLain, Jr. Phillips Petroleum Co., Atomic Energy Div., Idaho Falls, Idaho. May 60. Contract AT(10-1)-205. 55p. Order from OTS. $1.50. IDO-14505

Creep of tantalum under cyclic elevated temperatures, by R. L. Hammel and R. E. Uhrig. Iowa State University of Science and Technology, Ames Laboratory, Ames, Iowa. Apr 60. Contract W-7405-eng-82. 63p. Order from OTS. $1.75. IS-125

A proposed model for high temperature creep of tantalum, by R. E. Uhrig. Iowa State University, of Science and Technology, Ames Laboratory, Ames, Iowa. May 60. Contract W-7405-eng-82. 18p. Order from OTS. 75 cents. IS-138

Photometric procedures for the analysis of nuclear reactor corrosion products, by J. R. Ciaranello and K. E. Combs. Knolls Atomic Power Lab., Schenectady, N. Y. Dec 59. Contract W-31-109-Eng-52. 25p. Order from LC. Mi $2.70, ph $4.80. KAPL-M-JRC-2

Chemical problems of non-aqueous fluid-fuel reactors, by G. Scatchard and others. Massachusetts Inst. of Tech., Nuclear Engineering Project, Cambridge, Mass. Oct 52. Decl. Oct. 7, 1959. Contract AT(30-1)-1359. 99p. Order from LC. Mi $5.40, ph $15.30. MIT-5001

The zirconium-hydrogen system at high hydrogen contents, by G. G. Libowitz. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. Jun 60. Contract AT(11-1)-GEN-8. 26p. Order from OTS. 75 cents. NAA-SR-5015

Semi-annual progress report for the period July 1959 through December 1959, by C. J. Rodden. New Brunswick Laboratory, New Brunswick, N. J. May 60. 115p. Order from OTS. $2.25. NBL-159

Contamination and decontamination properties of textile fibers with respect to I^{101}. Progress report, by A. P. Talboys and R. A. Buckingham. Johns Hopkins University, Baltimore, Md. June 52. Contract AT(30-1)-946. 20p. Order from LC. Mi $2.70, ph $4.80. NYO-4520

Investigation of spectrochemical solution-methods of analysis. The use of designed experiments and statistical methods of analysis in the interpretation of data, by J. A. Norris and R. L. McCutchen. Oak Ridge National Laboratory, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 36p. Order from OTS. $1.25. ORNL-2927

Reactor Chemistry Division annual progress report for period ending January 31, 1960, by W. R. Grimes and H. F. McDuffie. Oak Ridge National Laboratory, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 195p. Order from OTS. $3.50. ORNL-2931

Purification of beryllium compounds: A literature survey, by R. E. Moore. Oak Ridge National Laboratory, Reactor Chemistry Division, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 40p. Order from OTS. $1.00. ORNL-2938

Plastic and elastomeric materials as shielding components for nuclear reactors, by J. W. Born. B. F. Goodrich Co., Research Center, Brecksville, Ohio. July 52. Decl. Oct. 2, 1959. Contract AT(40-1)-1309. 23p. Order from LC. Mi $2.70, ph $4.80. ORO-80

Rearrangements in 3-aryl-1-butyl systems. Final report, by A. W. Fort and R. E. Leary. University of Kentucky, Lexington, Ky. Oct 59. Contract AT(40-1)-2067. 118p. Order from LC. Mi $6.00, ph $18.30. ORO-227

I. Nuclear spectroscopic studies in the heaviest element region. II. An accelerating electron spectrograph. Thesis, by R. G. Albridge, Jr. University of California, Lawrence Radiation Laboratory, Berkeley, Calif. Apr 60. Contract W-7405-eng-48. 149p. Order from OTS. $2.50. UCRL-8642

Fission and spallatin in nuclear reactions induced by heavy ions. Thesis, by G. E. Bordon. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. May 60. Contract W-7405-eng-48. 151p. Order from OTS. $2.75. UCRL-9083

Bio-organic chemistry quarterly report, for December 1959, January and February 1960, by M. Calvin and others. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. Mar 60. Contract W-7405-eng-48. 52p. Order from OTS. $1.25. UCRL-9135

Longitudinal dispersion in beds of finely divided solids. Thesis, by J. M. Robinson. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. June 60. Contract W-7405-eng-48. 55p. Order from OTS. $1.25. UCRL-9193

Flame spectrophotometric determination of calcium in lead metal, by R. E. Barringer. Union Carbide Corp., Y-12 Plant, Oak Ridge, Tenn. June 60. Contract W-7405-eng-26. 21p. Order from OTS. 75 cents. Y-1295

Chemistry—Radiation and Radiochemistry

Progress report for period covering January 15, 1960 to February 15, 1960. Ionics, Inc., Cambridge, Mass. Feb 60. Contract AT(30-1)-2470. 6p. Order from LC. Mi $1.80, ph $1.80. AECU-4682

Behavior of carrier-free tracers. A bibliography of unclassified references, by M. Kahn, K. H. Jones and K. Lawson. University of New Mexico, Albuquerque, N. Mex. June 60. 127p. Order from OTS. $2.75. LA-2331UNM

Production of ionium from a pitch-blende residue, by C. W. Kuhlman, W. S. Knecht and R. D. Piper. Mallinckrodt Chemical Works, St. Louis, Mo. July 55. Decl. Nov. 23, 1959. 28p. Order from LC. Mi $2.70, ph $4.80. MCW-1379

Report for general research for December 11, 1950 to April 2, 1951. Radium volume. Mound Lab., Miamisburg, Ohio. May 51. Decl. Nov. 24, 1059. Contract AT-33-1-GEN-53. 76p. Order from LC. Mi $4.50, pn $12.30. MLM-557

Ac^{227} and Th^{228} production as a function of time for various values of neutron flux. Information report, by G. R. Grove, L. N. Russell and S. R. Orr. Mound Lab., Miamisburg, Ohio. Aug 52. Decl. Nov. 24, 1959. Contract AT-33-1-GEN-53. 11p. Order from LC. Mi $2.40, ph $3.30. MLM-747

Chemistry—Separation Processes for Plutonium and Uranium

Recovery of uranium from residues produced in hydrochlorination of nuclear fuel alloys, by T. A. Gens. Oak Ridge National Lab., Oak Ridge, Tenn. Apr 59. Contract W-7405-eng-26. 9p. Order from LC. Mi $1.80, ph $1.80. CF-59-4-9

Terminal report--design of a darex dissolution facility in ORNL Bldg. 3019 for enriched power reactor fuel elements, by R. C. Robertson. Oak Ridge National Lab., Oak Ridge, Tenn. Nov 59. 101p. Order from LC. Mi $6.00, ph $18.00. CF-59-11-26

Description of a proposed program: dynamic analysis of radiochemical plant components, by M. E. Whatley. Oak Ridge National Lab., Oak Ridge, Tenn. Dec 59. Contract W-7405-eng-26. 8p. Order from LC. Mi $1.80, ph $1.80. CF-59-12-45

Report of the chemistry and chemical engineering section for November, December 1955, January 1956, by D. H. Ahmann and others. General Electric Co. Knolls Atomic Power Laboratory, Schenectady, N. Y. Nov 56. Decl. June 18, 1960. Contract W-31-109-Eng-52. 103p. Order from OTS. $2.25. KAPL-1491

Decontamination of thorium by electrolysis a theoretical discussion, by W. N. Hansen. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. Jun 60. Contract AT (11-1)-GEN-8. 20p. Order from OTS. 50 cents. NAA-SR-4885

TBP process for uranium recovery from metal waste-laboratory summary, by T. C. Runion, C. V. Ellison and others. Oak Ridge National Laboratory, Oak Ridge, Tenn. Jan 50. Decl. June 18, 1960. Contract W-7405-eng-26. 65p. Order from OTS. 50 cents. ORNL-557

Chemical Technology Division monthly progress report for December 1957. Oak Ridge National Lab., Oak Ridge, Tenn. Apr 58. Decl. November 24, 1959. Contract W-7405-eng-26. 43p. Order from LC. Mi $3.30, ph $7.80. ORNL-2468

Solubilities of selected metals in mercury: Hermex process, by A. F. Messing and O. C. Dean. Oak Ridge National Lab., Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 20p. Order from OTS. 50 cents. ORNL-2871

Fused salt fuel processing in the ORNL volatility pilot plant, by C. L. Whittmarsh and W. H. Carr. Oak Ridge National Lab., Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 42p. Order from OTS. $1.25. ORNL-2918

Controlled Thermonuclear Processes

Thermonuclear project semiannual report for period ending January 31, 1960, by A. H. Snell and others. Oak Ridge National Lab., Oak Ridge, Tenn. [nd] Contract W-7405-eng-26. 112p. Order from OTS. $2.50. ORNL-2926

Papers presented at the Controlled Thermonuclear Conference held at Washington, D. C. on February 3-5, 1958, by N. C. Christofilos and others. Controlled Thermonuclear Branch, Division of Research, United States Atomic Energy Commission, Washington, D. C. May 60. 30p. Order from OTS. 75 cents. TID-7558 (Suppl. 1)

A grazing incidence vacuum spectrograph of simple design, by R. L. Kelly. University of California. Lawrence Radiation Laboratory, Livermore, Calif. Apr 60. Contract W-7405-eng-48. 14p. Order from OTS. 50 cents. UCRL-5924-T

Bibliography-controlled thermonuclear processes LRL Berkeley 1952-1958; LRL Livermore 1953-1958, by M. R. Thomas. University of California, Lawrence Radiation Laboratory, Berkeley, Calif. Mar 59. Contract W-7405-eng-48. 25p. Order from OTS. $1.00. UCRL-9019

Criticality Studies

Critical masses of oralloy lattices immersed in water, by G. E. Hansen and others. University of California. Los Alamos Scientific Laboratory, Los Alamos, N. Mex. Mar 57. Contract W-7405-ENG-36. 56p. Order from OTS. 50 cents. LA-2026

Plutonium graphite assemblies--Part II, by A. Goodwin and C. I. Schuske. Dow Chemical Co., Rocky Flats Plant, Denver, Colo. Aug 59. Decl. December 9, 1959. Contract AT(29-1)-1108. 21p. Order from LC. Mi $2.40, ph $3.30. RFP-158

Geology and Mineralogy

Sampling the upper atmosphere for particulate matter. Quarterly progress report no. 1 for the period of June 15, to September 15, 1959, by M. Markels, Jr. and J. H. Morgenthaler. Atlantic Research Corp., Alexandria, Va. Nov 59. Contract AT(30-1)-2404. 26p. Order from LC. Mi $2.70, ph $4.80. AECU-4626

Uranium occurrences in the Mojave mining district, Kern County, California, by H. E. Nelson. Salt Lake Branch Office, AEC. Grand Junction Operations Office, Salt Lake City, Utah. Feb 57. 27p. Order from OTS. 75 cents. RME-2058

Health and Safety

Upper atmosphere monitoring program. Progress report no. 8 for May 1, 1959 through July 31, 1959, by J. Baumstark and others. General Mills, Inc., Minneapolis, Minn. Jan 60. Contract AT (11-1)-401. 43p. Order from LC. Mi $3.30, ph $7.80. AECU-4680

Summary hazards evaluation of the SMR facility, by J. D. Simpson. General Electric Co., Aircraft Nuclear Propulsion Department, Cincinnati, Ohio. Dec 59. Contracts AF 33(600)-38062 and AT (11-1)-171. 60p. Order from OTS. $1.50. APEX-536

A climatological study of the Hanford area, by D. E. Jenne and R. E. Kerns. Hanford Atomic Products Operation, Richland, Wash. Nov 59. Contract AT(45-1)-1350. 131p. Order from OTS. $2.75. HW-57722

Health physics quarterly report for October to December 1959, by R. J. Feinberg. Knolls Atomic Power Lab., Schenectady, N. Y. Jan 60. Contract W-31-109-Eng-52. 20p. Order from LC. Mi $2.40, ph $3.30. KAPL-M-HP-3

Environmental monitoring summary for the Paducah Plant for 1959, by E. G. Brown and K. K. Mitchell chell. Union Carbide Nuclear Co., Division of Union Carbide Corp., Paducah Plant, Paducah, Ky. May 60. 7p. Order from OTS. 50 cents. KY-332

Some preliminary experiments with sodium and tetralin fires, by R. D. Keen. Atomics International Div., North American Aviation, Inc., Canoga Park, Calif. May 57. 13p. Order from LC. Mi $2.40, ph $3.30. NAA-SR-Memo-1952

Instruments

A regulated power supply for a high current magnet. Technical report no. 6, by R. B. Block. Case Institute of Technology, Cleveland, Ohio. July 59. Contract AT(11-1)-623. 30p. Order from LC. Mi $3.00, ph $6.30. AECU-4554

Present status of semiconductor particle counters, by C. A. Barnes. California Institute of Technology, W. K. Kellogg Lab. of Radiation, Pasadena, Calif. Nov 59. Contract Nonr-220(18). 8p. Order from LC. Mi $1.80, ph $1.80. AECU-4588

Unitized system of image intensifiers using fiber optics. Progress report for July to October 1959, by J. S. Kalafut. Westinghouse Electric Corp. Electronic Tube Div., Elmira, N. Y. 1959. Contract AT(30-1)-2176. 8p. Order from LC. Mi $1.80, ph $1.80. AECU-4622

High energy storage ceramic capacitor. Quarterly report no. 4 for August 19, 1957 to December 31, 1957, by D. A. Lupfer. General Electric Co. Specialty Electronic Components Dept., Auburn, N. Y. 1957. Contract AT(30-1)-1963. 73p. Order from LC. Mi $4.50, ph $12.30. AECU-4634

High energy storage ceramic capacitor. Quarterly report no. 5, for January 1, 1958 to March 31, 1958, by D. A. Lupfer. General Electric Co. Specialty Electronic Components Dept., Auburn, N. Y. 1958. Contract AT(30-1)-1963. 72p. Order from LC. Mi $4.50, ph $12.30. AECU-4635

Measurements of light transmittance through thick shielding windows, by T. W. Eckels. Argonne National Laboratory, Chemical Engineering Division, Argonne, Ill. May 60. Contract W-31-109-eng-38. 16p. Order from OTS. 50 cents. ANL-6159

Consolidated MCF-1400 oil diffusion pump, by C. E. Normand. Oak Ridge National Laboratory, Oak Ridge, Tenn. Nov 59. 18p. Order from LC. Mi $2.40, ph $3.30. CF-59-11-70

Line voltage and noise monitor, by T. J. Boland. Phillips Petroleum Co. Atomic Energy Division, Idaho Operations Office, Idaho Falls, Idaho. June 60. Contract AT(10-1)-205. 20p. Order from OTS. 50 cents. IDO-16608

A linear scanner for numan radioisotope research, by A. C. Morris, Jr. Oak Ridge Institute of Nuclear Studies, Medical Division, Oak Ridge, Tenn. Mar 60. Contract AT-40-1-Gen-33. 26p. Order from OTS. 75 cents. ORINS-33

The angular distribution of alpha particles emitted by oriented Np^{237} nuclei, by S. H. Hanauer and others. Oak Ridge National Laboratory, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 76p. Order from OTS. $2.25. ORNL-2919

Determination of certification intervals for standard resistors and precision potentiometers, by L. H. Bressan. Sandia Corporation, Albuquerque, N. Mex. June 60. 15p. Order from OTS. 50 cents. SCR-206

Metallurgy and Ceramics

Thermodynamic properties of carbides at high temperatures. Annual report and renewal proposal, by S. Fujishiro and N. A. Gokeen. University of Pennsylvania, Philadelphia, Pa. Sep 59. 8p. Order from LC. Mi $1.80, ph $1.80. AECU-4346

Using ceramics and cermets in nuclear power reactors, by G. L. Ploetz. Knolls Atomic Power Laboratory, Schenectady, N. Y. [nd.] 21p. Order from LC. Mi $2.40, ph $3.30. AECU-4354

A fundamental study of grain boundary phenomena in ceramic materials. Status report no. 1 for the period June 15, 1958 to March 1, 1959. Materials Research Corp., Yonkers, N. Y. 1959. Contract AT(30-1)-2178. 17p. Order from LC. Mi $2.40, ph $3.30. AECU-4364

The determination of the equilibrium phase diagram, zirconium-niobium, by C. E. Lundin. University of Denver, Denver Research Institute, Denver, Colo. Oct 59. Contract AT(11-1)-752. 8p. Order from LC. Mi $1.80, ph $1.80.
AECU-4402

Mechanical fabrication of rare earth metals, by K. M. Bohlander. General Electric Co. Aircraft Nuclear Propulsion Dept., Cincinnati, Ohio. Nov 59. 24p. Order from LC. Mi $2.70, ph $4.80. AECU-4425

Refining and purification of rare-earth metals, by C. L. Huffine and J. M. Williams. General Electric Co. Aircraft Nuclear Propulsion Dept., Cincinnati, Ohio. Nov 59. 32p. Order from LC. Mi $3.00, ph $6.30. AECU-4426

Uranium dioxide technology: A literature survey interim report, by D. E. Johnson and F. H. Lofftus. General Atomic Division, General Dynamics Corp., San Diego, Calif. May 58. Addendum, by D. E. Johnson, July 58. 22p. Order from LC. Mi $2.40, ph $3.30. AECU-4488

Study of factors influencing ductility of iron--aluminum alloys, Monthly progress report no. 8, by F. C. Perkins and J. F. Nachman. University of Denver, Denver Research Institute, Denver, Colo. Dec 59. Contract AT(11-1)-742. 9p. Order from LC. Mi $1.80, ph $1.80.
AECU-4528

Melting point of Th-U-C fuel elements, by L. Brewer. General Atomic Division, General Dynamics Corp., San Diego, Calif. Aug 59. Contract AT(04-3)-314. 4p. Order from LC. Mi $1.80, ph $1.80. AECU-4535

Thermal cycling of EBR-1, Mark III fuel, by G. K. Whitham and E. S. Sowa. Argonne National Laboratory, Argonne, Ill. Apr 60. Contract W-31-109-eng-38. 25p. Order from OTS. 75 cents.
ANL-6028

Metallurgy Division annual report for 1959, by F. G. Foote and others. Argonne National Laboratory, Argonne, Ill. 1959. Contract W-31-109-eng-38. 170p. Order from OTS. $2.75. ANL-6099

The diffusion of gold in gamma uranium, by S. J. Rothman. Argonne National Laboratory, Metallurgy Division, Argonne, Ill. May 60. Contract W-31-109-eng-38. 18p. Order from OTS. 50 cents. ANL-6127

Protective coatings for high-temperature metal alloys, by C. G. Harman and others. Battelle Memorial Institute, Columbus, Ohio. Dec 52. Decl. November 20, 1959. Contract W-7405-eng-92. 23p. Order from LC. Mi $2.70, ph $4.80. BMI-804

Further development of gas-pressure bonding of Zircaloy-clad flat-plate uranium dioxide fuel elements, by S. J. Paprocki and others. Battelle Memorial Institute, Columbus, Ohio. May 60. Contrcct W-7405-eng-92. 57p. Order from OTS. $1.50. BMI-1436

Development of corrosion-resistant niobium-base alloys, by D. J. Maykuth and others. Battelle Memorial Institute, Columbus, Ohio. May 60. Contract W-7405-eng-92. 89p. Order from OTS. $2.00. BMI-1437

Fluidized-bed coating of UO_2 powder with niobium and other elements, by J. M. Blocher, Jr. and others. Battelle Memorial Institute, Columbus, Ohio. May 60. Contract W-7405-eng-92. 54p. Order from OTS. $1.50. BMI-1440

An evaluation of data on nuclear carbides, by F. A. Rough and W. Chubb. Battelle Memorial Institute, Columbus, Ohio. May 60. Contract W-7405-eng-92. 100p. Order from OTS. $2.25.
BMI-1441

Apparatus for the study of fission-gas release from neutron-activated fueled graphite, by H. S. Rosenberg and others. Battelle Memorial Institute, Columbus, Ohio. June 60. Contract W-7405-eng-92. 8p. Order from OTS. 50 cents.
BMI-1444

Minutes of conference on hydrogen in uranium held at Battelle Memorial Institute, June 11, 1954, by C. R. Tipton, Jr. Battelle Memorial Institute, Columbus, Ohio. July 54. Decl. December 2, 1959. 23p. Order from LC. Mi $2.70, ph $4.80. BMI-X-126

Zirconium diboride, boron nitride, and boron carbide compatibility with austenitic stainless steel, by J. H. Cherubini and C. F. Leitten, Jr. Oak Ridge, National Laboratory, Oak Ridge, Tenn. July 59. Contract W-7405-eng-26. 19p. Order from LC. Mi $2.40, ph $3.30. CF-59-7-1

Improved bolting materials for intennal assembly of HRP components, by B. D. Draper. Oak Ridge National Laboratory, Oak Ridge, Tenn. Oct 59. 10p. Order from LC. Mi $1.80, ph $1.80.
CF-59-10-69

Sintering mechanism as applied to refractory oxides. A bibliography, 1955–1959, by D. R. Wilder. Iowa State University, Ames Laboratory, Ames, Iowa. Jan 60. Contract W-7405-eng-82. 51p. Order from OTS. $1.25. ISC-288(Suppl. II)

Compilation of calculated data useful in predicting metallurgical behavior of the elements in binary alloy systems, by E. Teatum and others. University of California. Los Alamos Scientific Laboratory, Los Alamos, N. Mex. June 60. Contract W-7405-ENG-36. 225p. Order from OTS. $3.50. LA-2345

Bibliography on tungsten, its alloys and compounds, by L. E. Godfrey, P. E. Bell and H. S. Stearns. University of California. Los Alamos Scientific Laboratory, Los Alamos, N. Mex. June 60. Contract W-7405-ENG-36. 208p. Order from OTS. $3.50. LAMS-2401 (Vol. 1)

Bibliography on tungsten, its alloys and compounds, by L. E. Godfrey, P. E. Bell, and H. S. Stearns. University of California. Los Alamos Scientific Laboratory, Los Alamos, N. Mex. June 60. Contract W-7405-ENG-36. 432p. Order from OTS. $3.50. LAMS-2401 (Vol. 2)

Properties of ceramic and cermet fuels for sodium graphite reactors, by N. R. Koenig and B. A. Webb. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. June 60. Contract AT(11-1)-GEN-8. 50p. Order from OTS. $1.50. NAA-SR-3880

Engineering evaluation of a mixed alloy fuel element irradiated at elevated temperatures in the SRE, by J. L. Ballif, B. R. Hayward and J. W. Walter. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. June 60. Contract AT(11-1)-GEN-8. 84p. Order from OTS. $2.25. NAA-SR-3888

The permeation of hydrogen through hastelloy B, by D. W. Rudd, D. W. Vose and J. B. Vetrano. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. June 60. Contract AT(11-1)-GEN-8. 17p. Order from OTS. 75 cents. NAA-SR-4898

Dispersion fuels for advanced organic moderated reactor, by J. Kroehler, Jr. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. June 60. Contract AT(11-1)-GEN-8. 44p. Order from OTS. $1.25. NAA-SR-5018

Carbide fuel development: Phase I report for period of May 15 to September 15, 1959, by A Strasser and others. Nuclear Development Corporation of America, White Plains, N. Y. and The Carborundum Company, Niagara Falls, N. Y. Oct 59. Contract AT(30-1)-2303. 100p. Order from OTS. $2.50. NDA-2140-2

Diffusion annealing as a means of improving corrosion resistance of Zircaloy-2 clad, uranium-2^{w}/o zirconium rods, by R. G. Jenkins. Nuclear Metals, Inc., Concord, Mass. Apr 60. Contract AT(30-1)-1565. 70p. Order from OTS. $1.75.
NMI-1217

Beryllium-clad uranium elements, fabrication development by multi-temperature extrusion, and dimensional stability on thermal cycling, by J. Greenspan. Nuclear Metals, Inc., Concord, Mass. Mar 60. Contract AT(30-1)-1565. 41p. Order from OTS. $1.00. NMI-1219

Multi-temperature extrusions, by E. S. Guidoboni, I. B. Roll and P. Loewenstein. Nuclear Metals, Inc., Concrrd, Mass. Mar 60. Contract AT (30-1)-1565. 49p. Order from OTS. $1.25.
NMI-1229

Interdiffusion in Zircaloy-2 clad U-2^{w}/o Zr fuel materials and its effects upon corrosion behavior, by A. L. Geary. Nuclear Metals, Inc., Concord, Mass. Mar 60. Contract AT(30-1)-1565. ,27p. Order from OTS. 50 cents. NMI-1233

Magnetic determination of impurities in uranium fuel slugs, by D. Whal and A. Liboff. Atomic Energy Division, Sylvania Electric Products, Inc., Bayside, N. Y. June 56. Decl. May 18, 1960. Contract AT-30-1-GEN-366. 21p. Order from OTS. 35 cents. SEP-167

The terminal report on the fabrication of hollow cylindrical fuel elements, by J. Fugardi and R. E. King. Atomic Energy Division, Sylvania Electric Products Inc., Bayside, N. Y. Feb 56. Decl. May 17, 1960. 22p. Order from OTS. 30 cents.
SEP-187

Metallographic techniques of U-base alloys, by J. Gross. Atomic Energy Division, Sylvania Electric Products, Inc., Bayside, N. Y. Feb 56. Decl. May 18, 1960. Contract AT-30-1-Gen-366. 11p. Order from OTS. 25 cents. SEP-188

A study of the hydride process for producing thorium powder, by R. H. Witt, J. Nylin, and N. M. McCullough. Atomic Energy Division, Sylvania Electric Products, Inc., Bayside, N. Y. Aug 56. Decl. May 19, 1960. 30p. Order from OTS. 35 cents. SEP-221

Dimensional instability of uranium - I. First annual progress report for June 30th, 1955 to June 30th, 1956, by R. Resnick and L. Seigle. Atomic Energy Division, Sylvania Electric Products, Inc., Bayside, N. Y. June 56. Decl. May 23, 1960. Contract AT-30-1-GEN-366. 22p. Order from OTS. 30 cents. SEP-228

Metallographic techniques for bond study of aluminum-clad nickel-plated uranium fuel elements, by H. W. Woods. Atomic Energy Division, Sylvania Electric Products, Inc., Bayside, N. Y. Mar 57. Decl. May 19, 1960. Contract AT-30-1-GEN-366. 11p. Order from OTS. 25 cents. SEP-238

Welding and brazing. A literature search, by T. F. Davis. AEC Technical Information Service Extension, Oak Ridge, Tenn. Feb 60. 100p. Order from OTS. $2.50. TID-3546

Slip casting of nuclear fuel elements. Report no. III, by G. J. Comstock and others. Stevens Institute of Technology, Powder Metallurgy Laboratory, Hoboken, N. J. May 60. Contract AT(30-1)-2258. 11p. Order from OTS. 50 cents. TID-5629

Development of boron-bearing materials for application as lumped burnable poisons, by D. Jaffe, E. E. F. Losco, and S. F. Kaufman. Westinghouse Electric Corp., Bettis Atomic Power Laboratory, Pittsburgh, Pa. May 60. Contract AT-11-1-GEN-14. 64p. Order from OTS. $1.75. WAPD-221

Halogen additions to inert-atmosphere weld chambers, by R. L. Matchett and W. L. Frankhouser. Westinghouse Electric Corp., Bettis Atomic Power Laboratory, Pittsburgh, Pa. May 60. Contract AT-11-1-GEN-14. 18p. Order from OTS. 75 cents. WAPD-223

Minutes--AEC welding committee meeting Oak Ridge National Laboratory February 2 and 3, 1953. Technical Information Service, Oak Ridge, Tenn. 1953. Decl. March 17, 1960. 159p. Order from OTS. 70 cents. WASH-143

Nuclear fuels newsletter, by E. Epremian. Division of Research, Washington, D. C. Aug 57. Decl. May 10, 1960. 38p. Order from OTS. 40 cents. WASH-703

Uranium alloy newsletter, by E. Epremian. Division of Research, Washington, D. C. [nd.] Decl. May 23, 1960. 25p. Order from OTS. 35 cents. WASH-700

Effect of annealing time and working on indicated thickness of uranium, by R. B. Burditt. Union Carbide Nuclear Co., Division of Union Carbide Corporation, Y-12 Plant, Oak Ridge, Tenn. Dec 59. Contract W-7405-eng-26. 13p. Order from OTS. 75 cents. T-1293

Particle Accelerators and High-Voltage Machines

Electron model of a spiral sector accelerator, by D. W. Kerst and others. Midwestern Universities Research Association, Madison, Wis. [nd.] 136p. Order from OTS. $2.75. MURA-559

Computational results pertaining to use of a time-dependent magnetic field perturbation to implement injection or extraction in a ffag synchrotron by use of the $\nu_r = N/3$ resonance, by L. J. Laslett and K. R. Symon. Midwestern Universities Research Association, Madison, Wis. Mar 60. Contract AT(11-1)-384. 70p. Order from OTS. $2.00. MURA-561

Alternative formulations of magnetostatic problems, by R. S. Christian and S. C. Snowdon. Midwestern Universities Research Association, Madison, Wis. Apr 60. Contract AT(11-1)-384. 11p. Order from OTS. 50 cents. MURA-568

Physics and Mathematics

The imaginary part of the optical potential, by L. C. Gomes. Rio de Janeiro. Centro Brasileiro de Pesquisas Fsicas and Massachusetts Institute of Technology, Laboratory for Nuclear Science, Cambridge, Mass. 1959. Contract AT(30-1)-2098. 13p. Order from LC. Mi $2.40, ph $3.30 AECU-4365

Nuclear interactions in carbon produced by cosmic rays with energies between 10^{10} and 10^{12} ev, by L. F. Hansen and W. B. Fretter. University of California, Berkeley, Calif. Dec 59. Contract Nonr-222(40). 45p. Order from LC. Mi $3.00, ph $6.30. AECU-4566

Publications for 1959. University of Pennsylvania, Philadelphia, Pa. 1959. Contract AT(30-1)-2202. 116p. Order from LC. Mi $6.00, ph $18.30. AECU-4604

Technical progress report. Part I. High-speed computer program. Part II. Mathematical methods.

Part III. Illiac use and operation. Part IV. IBM 650 use and operation. Part V. General laboratory information. University of Illinois, Digital Computer Lab., Urbana, Ill. Sep 59. Contract AT(11-1)-415 and Nonr-1834(15). 23p. Order from LC. Mi $2.70, ph $4.80. AECU-4615

Radioisotope X-ray generator. Quarterly progress report no. 2 covering the period from October 1, 1959 to December 31, 1959, by M. W. Chisholm, R, J. Lambert and J. Kastner. Picker X-Ray Corp. Picker Research Center, Cleveland, Ohio. 1959. Contract AT(11-1)-746. 20p. Order from LC. Mi $2.40, ph $3.30. AECU-4632

The design and uses of high flux research and test reactors, by J. A. Lane. Oak Ridge National Laboratory, Oak Ridge, Tenn. 1959. Contract W-7405-eng-26. 39p. Order from LC. Mi $3.00, ph $6.30. AECU-4650

Theory of pion scattering and photoproduction, by G. F. Chew. University of Illinois. Urbana, Ill. and Institute for Advanced Study, Princeton, N.J. 1956. 150p. Order from LC. Mi $7.20, ph $22.80. AECU-4664

Studies of reactor containment. Monthly technical progress report no. 32 covering period December 1, 1959 through December 31, 1959, by T. A. Zaker. Illinois Institute of Technology, Armour Research Foundation, Chicago, Ill. Jan 60. Contract AT(11-1)-528. 4p. Order from LC. Mi $1.80, ph $1.80. AECU-4675

A crystallographic least squares refinement program for the IBM 704: Identification PS XR3, by V. Vand and R. Pepinsky. Pennsylvania State University, Crystal Research Lab., and Groth Institute, University Park, Pa. Oct 59. Contract N60nr-26916; AF49(638)-416 and AT(30-1)-1516. 140p. Order from LC. Mi $6.90, ph $21.30. AECU-4678

Proceedings of the conference on the physics of breeding October 19-21, 1959. Argonne National Laboratory, Lemont, Illinois. 1959. 399p. Order from OTS. $6.00. ANL-6122

Heat transfer in thermal radiation absorbing and scattering media, by R. Viskanta. Argonne National Laboratory, Argonne, Ill. May 60. Contract W-31-109-eng-38. 187p. Order from OTS. $3.00. ANL-6170

Two-group constants for reactor materials, by M. J. Stanley. Aircraft Nuclear Propulsion Department General Electric Co., Cincinnati, Ohio. May 58. Decl. November 4, 1959. Contracts AF33(038)-21102 and AT(11-1)171. 61p. Order from OTS. $1.50. APEX-369

Finite cylinder gamma heating program (Monte Carlo Research Series), by General Electric Co. Aircraft Nuclear Propulsion Department, Cincinnati, Ohio. May 58. Contracts AF 33(600)-38062 and AT(11-1)-171. 18p. Order from OTS. 75 cents. APEX-552

High-temperature hydraulic rod control. General Electric Co. Aircraft Nuclear Propulsion Department, Light Military Electronics Department, Cincinnati, Ohio. May 60. Contracts AF 33(600)-38062 and AT(11-1)-171. 92p. Order from OTS. $2.25. APEX-556

Liquid metal fuel reactor experiment. Quarterly Technical report for October to December 1958. The Babcock and Wilcox Company, Atomic Energy Division, Lynchburg, Va. 1958. Contract AT (30-1)-1940. 139p. Order from OTS. $2.75. BAW-1135

Liquid metal fuel reactor experiment. Critical experiment, report of experimental data, by T. C. Engelder and others. The Babcock and Wilcox Company, Critical Experiment Laboratory, Lynchburg, Va. Mar 60. Contract AT(30-1)-1940. 73p. Order from OTS. $2.00. BAW-1185

A method for measuring the U^{239} fission cross section, by M. Clark. Brookhaven National Laboratory, Associated Universities, Inc., Upton, N. Y. June 52. Decl. April 13, 1960. 21p. Order from OTS. 30 cents. BNL-205

A study of the wind profile in the lowest 400 feet of the atmosphere. Progress report no. 5 for October 16, 1959 to January 15, 1960, by I. A. Singer. Brokkhaven National Laboratory, Upton, N. Y. 1960. 43p. Order from OTS. $1.50. BNL-596 (T-170)

Sodium component study. Combustion Engineering, Inc., Nuclear Components Engineering Dept., Chattanooga, Tenn. Feb 59. Contract AT(11-1)-665. 292p. Order from LC. Mi $11.10, ph $45.00. CENC-1038

Temperature distribution in thin walled heat-exchangers having non-circular flow passages, by W. S. Farmer. Oak Ridge National Laboratory, Oak Ridge, Tenn. Oct 51. Decl. with deletions February 19, 1957. 15p. Order from LC. Mi $2.40, ph $3.30. CF-51-10-178(Del.)

Basic inelastic neutron data for age calculations for various fuel and moderator compositions, by C. M. Copenhaver. Oak Ridge National Laboratory, Oak Ridge, Tenn. June 6956. Decl. with deletions March 15, 1957. Contract W-7405-eng-26. 14p. Order from LC. Mi $2.40, ph $3.30. CF-56-6-40(Del.)

Present and proposed methods for calculating absorption and radial divergence corrections for diffraction line contours from debyescherrer powder patterns, by J. M. Carter and F. J. Musil. Goodyear Atomic Corp., Portsmouth, Ohio. Oct 59. Contract AT(33-2)-1. 43p. Order from LC. Mi $3.30, ph $7.80. GAT-T-689

The detection of freon leaks in converters by infrared methods, by D. L. Scott. Goodyear Atomic Corp., Portsmouth, Ohio. Dec 59. Contract AT(33-2)-1. 17p. Order from LC. Mi $2.40, ph $3.30. GAT-T-707

Water loss rates following a piping failure in the PRTR, by T. W. Ambrose. Hanford Atomic Products Operation, Richland, Wash. Feb 60. Contract AT(45-1)-1350. 21p. Order from OTS. 75 cents. HW-60654 REV-2

Equations of state for steamwater mixtures and some representative applications analysis, by W. J. Love. General Electric Co. Hanford Atomic Products Operation, Richland, Wash. Nov 59. Contract AT(45-1)-1350. 20p. Order from LC. Mi $2.40, ph $3.30. HW-62858

Coordinates for semi-rigid molecules, by H. L. McMurry. Phillips Petroleum Co., Atomic Energy Division, Idaho Falls, Idaho. May 60. Contract AT(10-1)-205. 31p. Order from OTS. $1.00. IDO-16600

Materials testing reactor. Engineering test reactor technical branches. Quarterly report for October I to December 31, 1959, by J. R. Huffman and others. Phillips Petroleum Co., Atomic Energy Division, Idaho Falls, Idaho. May 60. Contract AT(10-1)-205. 65p. Order from OTS. $2.00. IDO-16620

Tram, a Monte Carlo thermal neutron code for the IBM 704, by M. A. Martino and W. W. Stone. General Electric Co., Knolls Atomic Power Laboratory, Schenectady, N. Y. June 59. Contract W-31-109-eng-52. 33p. Order from OTS. $1.75. KAPL-2039

Long term irradiation of natural dysprosium, by E. C. Hansen. Knolls Atomic Power Lab., Schenectady, N. Y. Dec 59. Contract W-31-109-Eng-52. 22p. Order from LC. Mi $2.70, ph $4.80. KAPL-M-ECH-2

Isotopic shielded poison burnout, by E. L. Wachspress. Knolls Atomic Power Lab., Schenectady, N. Y. Nov 59. Contract W-31-109-Eng-52. 7p. Order from LC. Mi $1.80, ph $1.80. KAPL-M-ELW-10

Increasing convergence rates by transforming the multigroup operator--application to one space dimension problems, by E. L. Wachspress. Knolls Atomic Power Lab., Schenectady, N. Y. Dec 59. Contract W-31-109-Eng-52. 12p. Order from LC. Mi $2.40, ph $3.30. KAPL-M-ELW-11

A variational procedure for obtaining spatially dependent thermal spectra, by G. P. Calame and P. D. Federighi. Knolls Atomic Power Lab., Schenectady, N. Y. Dec 59. 44p. Order from LC. Mi $3.30, ph $7.80. KAPL-M-GPC-2

Some asymptotic results for a coverage problem, by M. Halperin. Knolls Atomic Power Lab., Schenectady, N. Y. Sep 59. Contract W-31-109-Eng-52. 23p. Order from LC. Mi $2.70, ph $4.80. KAPL-M-MH-2

Performance and evaluation of natural circulation power plants, by M. M. Schorr. Knolls Atomic Power Lab., Schenectady, N. Y. Dec 59. Contract W-31-109-Eng-52. 48p. Order from LC. Mi $3.30, ph $7.80. KAPL-M-NPA-1

Jet pump test for NCR application, by M. Nazar and R. Eisenstadt. Knolls Atomic Power Lab., Schenectady, N. Y. Jan 60. Contract W-31-109-Eng-52. 63p. Order from LC. Mi $3.90, ph $10.80. KAPL-M-NPA-4

Numerical solution of transient and steady-state neutron transport problems, by B. Carlson. Los Alamos Scientific Laboratory, Los Alamos, N. Mex. May 59. Contract W-7405-eng-36. 30p. Order from LC. Mi $2.60, ph $3.30. LA-2260

Collision integrals and transport properties for gases obeying an exponential repulsive potential. Application to hydrogen and helium, by J. B. Mann. University of California. Los Alamos Scientific Laboratory, Los Alamos, N. Mex. June 60. Contract W-7405-ENG-36. 58p. Order from OTS. $1.75. LA-2383

Solution of a problem to obtain the optimum energy for a rocket initially in a circular orbit, by G. A. Baker, Jr. and J. G. Wills. University of California. Los Alamos Scientific Laboratory, Los Alamos, N. Mex. July 60. Contract W-7405-ENG-36. 20p. Order from OTS. 75 cents. LAMS-2403

The structure of certain finite difference schemes, by B. Wendroff. University of California. Los Alamos Scientific Laboratory, Los Alamos, N. Mex. June 60. Contract W-7405-ENG-36. 11p. Order from OTS. 50 cents. LA-2410

Study of slightly-enriched uranium-water lattices with high conversion ratio. Quarterly progress report for August 1, 1959, to October 31, 1959, by Combustion Engineering, Inc., Nuclear Div., Windsor, Conn. May 60. Contract AT(30-1)-2379. 59p. Order from OTS. $1.50. NYO-2702

Nuclear data processing on an IBM-704 computer with the Condac program, by C. D. Goodman and B. D. Williams. Oak Ridge National Laboratory, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 27p. Order from OTS. $1.00. ORNL-2925

High energy nuclear reactions. A literature search, by J. Hudis. Brookhaven National Laboratory, Upton, N. Y. Mar 60. 40p. Order from OTS. $1.00. TID-3901

Ionic mass transport by free convection to horizontal electrodes. Thesis, by E. J. Fenech. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. Apr 60. Contract W-7405-eng-48. 81p. Order from OTS. $2.25. UCRL-9079

Microscope equipment for nuclear emulsion analysis, by J. C. Hodges. University of California, Lawrence Radiation Laboratory, Berkeley, Calif. Feb 60. Contract W-7405-eng-48. 132p. Order from OTS. $2.75. UCRL-9089

Some nuclear and electronic ground-state properties of Pa^{233}, Am^{241}, and 16-hr Am^{242}. Thesis, by J. Winocur. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. Apr 60. Contract W-7405-eng-48. 128p. Order from OTS. $2.50. UCRL-9174

Relativistic and diamagnetic corrections of atomic g values, by I. P. K. Lindgren. University of California. Lawrence Radiation Laboratory, Berkeley, Calif. May 60. Contract W-7405-eng-48. 31p. Order from OTS. 75 cents. UCRL-9184

SN5001--An IBM-650 code for steady-state thermal evaluation of an instrumented multi-fuel-plate subassembly, by E. Arbtin and R. B. Westphal. Westinghouse Electric Corp., Bettis Atomic Power Laboratory, Pittsburgh, Pa. Apr 60. Contract AT-11-1-GEN-14. 21p. Order from OTS. 75 cents. WAPD-TM-146

Calculation of thermal neutron fluxes in primary shields, by D. C. Anderson and K. Shure. Westinghouse Electric Corp., Bettis Atomic Power Laboratory, Pittsburgh, Pa. Nov 59. Contract AT-11-1-GEN-14. 41p. Order from OTS. $1.25. WAPD-TM-193

ABRAC - an IBM-704 three dimensional nuclear-thermal depletion program with distributed void effects, by W. M. Jacobi and others. Westinghouse Electric Corp., Bettis Atomic Power Lab., Pittsburgh, Pa. Mar 60. Contract AT-11-1-GEN-14. 130p. Order from OTS. $2.75. WAPD-TM-203

Euripus-3 and daedalus--Monte Carlo density codes for the IBM-704, by H. J. Amster, H. G. Kuehn and J. Spanier. Westinghouse Electric Corp., Bettis Atomic Power Laboratory, Pittsburgh, Pa. Feb 60. Contract AT-11-1-GEN-14. 91p. Order from OTS. $2.25. WAPD-TM-205

An experiment to measure effective delayed neutron fractions, by S. Kaplan and A. F. Henry. Westinghouse Electric Corp., Bettis Atomic Power Laboratory, Pittsburgh, Pa. Feb 60. Contract AT-11-1-GEN-14. 29p. Order from OTS. $1.00. WAPD-TM-209

A dimensional analysis of the departure from nucleate boiling heat flux in forced convection, by P. Griffith. Westinghouse Electric Corp., Bettis Atomic Power Laboratory, Pittsburgh Pa. Dec 59. Contract AT-11-1-GEN-14. 25p. Order from OTS. 75 cents. WAPD-TM-210

Temp-2 a one dimensional transient thermal stress program for the IBM-704, by L. M. Culpepper and D. Jortner. Westinghouse Electric Corp., Bettis Atomic Power Laboratory, Pittsburgh, Pa. Apr 60. Contract AT-11-1-GEN-14. 17p. Order from OTS. 50 cents. WAPD-TM-214

*Reports to the AEC Nuclear Cross Sections Advisory Group, Washington, D. C. April 28-29, 1960, by J. A. Harvey. Oak Ridge National Laboratory, Oak Ridge, Tenn. 1960. 74p. Order from OTS. $2.25. WASH-1028

Radiation Effects on Materials

Effects of irradiation on some corrosion-resistant fuel alloys, by J. H. Kittel and K. F. Smith. Argonne National Laboratory, Argonne, Ill. May 60. Contract W-31-109-eng-38. 18p. Order from OTS. 50 cents. ANL-5640

A study of the effects of fission fragment recoils on the oxidation of zirconium, by W. C. Yee. Oak Ridge National Laboratory, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 90p. Order from OTS. $2.50. ORNL-2742

Radioactive Waste

Effect of atomic interaction potential on defect production in metals, by E. Brown and G. H. Goedecke. Rensselaer Polytechnic Institute, Troy, N. Y. 195?. Contract AT(30-1)-1995. 11p. Order from LC. Mi $2.40, ph $3.30. AECU-4564

Capacity test data for the adsorption of volatile ruthenium on silica gel, by D. R. Anderson and D. W. Rhodes. Phillips Petroleum Co., Atomic Petroleum Co., Atomic Energy Division, Idaho Falls, Idaho. June 60. Contract AT(10-1)-205. 22p. Order from OTS. 75 cents. IDO-14510

Winchester Laboratory, quarterly report for January 1, 1960 to March 31, 1960, by A. C. Herrington. National Lead Company, Inc., Winchester Laboratory, Winchester, Mass. 1960. Contract AT(49-6)-924. 38p. Order from OTS. 75 cents. WIN-116

Reactors—General

Fate of fission product gases in the coolant stream, by L. Brewer. General Atomic Division, General Dynamics Corp., San Diego, Calif. Aug 59. Contract AT(04-3)-314. 3p. Order from LC. Mi $1.80, ph $1.80. AECU-4536

Vaporization processes in a runaway reactor, by L. Brewer. General Atomic Division, General Dynamics Corp., San Diego, Calif. Aug 59. Contract AT(04-3)-314. 5p. Order from LC. Mi $1.80, ph $1.80. AECU-4539

The helium cooled loop in the GETR, by R. F. Hausman. General Electric Co., Atomic Equipment Dept., San Jose, Calif. 1959? 11p. Order from LC. Mi $2.40, ph $3.30. AECU-4621

Initial testing and operation of the Argonne low power reactor (ALPR), by E. E. Hamer. Argonne National Laboratory, Argonne, Ill. Dec 59. Contract W-31-109-eng-38. 261p. Order from OTS. $4.00. ANL-6084

The internal feedback of EBR-I Mark-III, by J. C. Carter. Argonne National Laboratory, Argonne Ill. Feb 60. Contract W-31-109-eng-38. 72p. Order from OTS. $2.00. ANL-6124

Studies of reactor containment. Summary report no. 2 for August 1, 1959 to January 31, 1960, by T. A. Zaker. Armour Research Foundation of Illinois Institute of Technology, Chicago, Ill. Feb 60. Contract AT(11-1)-528. 80p. Order from OTS. $2.25. ARF-4132-13

The BMI-16 recirculating gas loop installed at the ETR, by J. V. Baum and others. Battelle Memorial Institute, Columbus, Ohio. Mar 60. Contract W-7405-eng-92. 43p. Order from OTS. $1.50. BMI-1429

Industrial chemical production by chemo-nuclear processes with special reference to the production of fixed nitrogen, by G. Lellouche and M. Steinberg. Brookhaven National Laboratory, Upton, N. Y. Sep 59. 59p. Order from OTS. $2.00. BNL-574 (T-157)

Metal-water reactions: V. The kinetics of metal-water reactions -- low pressure studies, by S. C. Furman. General Electric Co., Vallecitos Atomic Laboratory, Atomic Power Equipment Dept., Pleasanton, Calif. July 59. Contract AT(04-3)-189. 64p. Order from OTS. $1.75. GEAP-3208

Metal-water reactions: VII. Reactor safety aspects of metal-water reactions, by L. F. Epstein. General Electric Company, Vallecitos Atomic Laboratory, Atomic Power Equipment Dept., Pleasanton, Calif. Jan 60. Contract AT(04-3)-189. 73p. Order from OTS. $2.00. GEAP-3335

Status report on control rod materials research and development program, by C. G. Andre and others. General Electric Co., Vallecitos Atomic Laboratory, Atomic Power Equipment Dept., Pleasanton, Calif. Feb 60. Contract AT(04-3)-189. 55p. Order from OTS. $1.50. GEAP-3355

The MTR/ETR safeguard committee, by R. J. Nertney. Phillips Petroleum Company. Atomic Energy Division, Idaho Falls, Idaho. Apr 60. Contract AT(10-1)-205. 12p. Order from OTS. 50 cents. IDO-16569

Safeguard report on the proposed method of annealing graphite in the X-10 reactor, by L. E. Stanford. Oak Ridge National Laboratory, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 146p. Order from OTS. $3.00. ORNL-2725

Effect of heat flux on the corrosion of aluminum by water. Part I. Experimental equipment and preliminary test results, by J. C. Griess and others. Oak Ridge National Laboratory, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 44p. Order from OTS. $1.50. ORNL-2939

Reactors—Power

Experimental gas cooled reactor. Preliminary proposal, by Henry J. Kaiser Company Kaiser Engineers Division, Oakland, Calif. and Allis-Chalmers Manufacturing Company, Nuclear Power Department, Washington, D. C. Aug 59. Contract AT(10-1)-925. 150p. Order from OTS. $4.00. AECU-4701(Pt. 1)

Annual report for February 1958 to February 1959. Prepared by ALCO Products Ind. Staff, Ft. Belvoir, Va. ALCO Products, Inc., Schenectady, N. Y. June 1959. Contract AT(30-3)-326. 74p. Order from OTS. $2.00. APAE-47

Liquid metal fuel reactor experiment. Nonnuclear instrumentation for liquid bismuth service, by B. L. Birch. Babcock and Wilcox Company, Lynchburg, Va. Apr 60. Contract AT(30-1)-1940. 32p. Order from OTS. $1.75. BAW-1069

Liquid metal fuel reactor experiment. Investigation and testing of welded and brazed molybdenum joints. Final report, by R. E. Pavlak. The Babcock and Wilcox Company, Lynchburg, Va. Apr 60. Contract AT(30-1)-1940. 38p. Order from OTS. $1.25. BAW-1098

Maritime gas-cooled reactor program. Quarterly progress report for the period ending June 30, 1959, by S. A. Bernsen and others. General Dynamics Corporation, General Atomic and Electric Boat Division, San Diego, Calif. 1959. Contract AT(04-3)-187. 180p. Order from OTS. $3.50. GD-1099

Corrosion of beryllium in flowing sodium, by W. W. Kendall. General Electric Company. Atomic Power Equipment Department, Schenectady, N. Y. Jan 60. Contract AT(04-3)-189 PA#6. 27p. Order from OTS. $1.00. GEAP-3333

Exponential pile measurements with hollow slugs in graphite-uranium lattices, by E. D. Clayton and others. Hanford Atomic Pooducts Operation, Richland, Wash. Apr 55. Decl. June 17, 1960. Contract W-31-109-Eng-32. 32p. Order from OTS. 35 cents. HW-36174

ETR cycle 18 thermal and fast neutron flux measurements, by L. D. Weber and C. H. Hogg. Phillips Petroleum Co. Atomic Energy Division, Idaho Operations Office, Idaho Falls, Idaho. June 60. Contract AT(10-1)-205. 49p. Order from OTS. $1.00. IDO-16563

Thermal performance of the SRE main intermediate heat exchanger, by K. W. Foster. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. June 60. Contract AT(11-1)-GEN-8. 66p. Order from OTS. $1.50. NAA-SR-3775

OMRE fuel plate surface temperature measurement, by S. Sudar. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. May 60. Contract AT(11-1)-GEN-8. 38p. Order from OTS. $1.25. NAA-SR-4047

Piqua prototype handling system, by H. Nadler. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. May 60. Contract AT(11-1)-GEN-8. 94p. Order from OTS. $2.25. NAA-SR-4361

Hydraulic characteristics of HNPF preliminary design fuel elements, by S. Sudar and D. Rosh. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. May 60. Contract AT(11-1)-GEN-8. 31p. Order from OTS. $1.00. NAA-SR-4385

Dielectric properties of terphenyl mixtures, by R. J. Sullivan and F. C. Silvey. Atomics International A Division of North American Aviation, Inc., Canoga Park, Calif. May 60. Contract AT(11-1)-GEN-8. 17p. Order from OTS. 75 cents. NAA-SR-4764

Plutonium-Enriched OMR cores, by T. J. Connolly. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. May 60. Contract AT(11-1)-GEN-8. 45p. Order from OTS. $1.25. NAA-SR-4812

OMR degasifier loop experiment, by G. W. Corporales and P. R. Benson. Atomics International. A Division of North American Aviation, Inc., Canoga Park, Calif. May 60. Contract AT(11-1)-GEN-8. 44p. Order from OTS. $1.25. NAA-SR-4886

Feasibility study on centrifuge enrichment of the by-pass stream of the pebble bed reactor, by H. M. Parker and J. Mowat. University of Virginia, Research Laboratories for the Engineering Sciences, Charlottesville, Va. Nov 59. Contract AT(30-1)-2207. 25p. Order from OTS. 75 cents. NYO-2707

Gas-cooled reactor project. Quarterly progress report for period ending March 31, 1960, by Staff of Oak Ridge National Laboratory, Oak Ridge, Tenn. 1960. Contract W-7405-eng-26. 255p. Order from OTS. $3.50. ORNL-2929

Technology—Feed Materials

The influence of lubrication on the compactability of magnesium-green salt blends for bomb reduction, by S. J. Paprocki, R. J. Carlson, and E. G. S Smith, Jr. Battelle Memorial Institute, Columbus, Ohio. June 57. Decl. May 16, 1960. Contract W-7405-eng-92. 14p. Order from OTS. 30 cents. BMI-1193

Studies relating to hydrogen in dingot uranium, by M. J. Trzeciak and M. W. Mallett. Battelle Memorial Institute, Columbus, Ohio. Sep 57. Decl. May 16, 1960. Contract W-7405-eng-92. 32p. Order from OTS. 65 cents. BMI-1225

Process development quarterly report, Part II, by N. E. Berry and others. Mallinckrodt Chemical Works, St. Louis, Mo. Feb 56. Decl. June 18, 1960. Contract W-14-108-eng-8. 181p. Order from OTS. $2.75. MCW-1383

Process development quarterly report. Part I, Laboratory work, by B. Elliott and others. Mallinckrodt Chemical Works, St. Louis, Mo. July 57. Decl. June 18, 1960. Contract W-14-108-eng-8. 202p. Order from OTS. $3.00. MWM-1403

Process development quarterly report. Part I, Laboratory work, by B. Elliott and others. Mallinckrodt Chemical Works, St. Louis, Mo. Oct 57. Decl. June 18, 1960. Contract W-14-108-eng-8. 118p. Order from OTS. 70 cents. MCW-1407

Process development quarterly report. Part II, Pilot Plant Work, by B. Elliott and others. Mallinckrodt Chemical Works, St. Louis, Mo. Nov 57. Decl. May 31, 1960. Contract W-14-108-eng-8. 80p. Order from OTS. $1.50. MCW-1409

Green salt moving bed process, by R. W. LeGassie and others. New Brunswick Laboratory, New Brunswick, N. J. June 55. Decl. June 17, 1960. 66p. Order from OTS. 50 cents. NBL-105

Process development quarterly report, Part I, by A. E. Rueyle and J. U. Shepardson. Mallinckrodt Chemical Works, St. Louis, Mo. July 53. Decl. June 18, 1960. Contract W-14-108-Eng-8. 54p. Order from OTS. 45 cents. NYO-1355

Technology—Raw Materials

Controlled pH stripping of uranium from amines, by D. J. Crouse. Oak Ridge National Laboratory, Chemical Techn logy Division, Chemical Development Section C, Oak Ridge, Tenn. [nd.] Contract W-7405-eng-26. 23p. Order from OTS. 75 cents. ORNL-2941

U. S. Government RESEARCH REPORTS

this issue

The Arc Image Furnace for Growing Semiconductor Crystals

Research on Techniques for the Production of Ultra-Pure Beryllium

Photographic Chemicals and Emulsions

Investigation of Sinterable Powders and Properties of Beryllia Ceramics

The Effect of Humidity on the Consistency of Greases

Development of Textile Type Vitreous Silica Yarns

Alkaline-Organic Missile Component Paint Removers

High Speed Communications Equipment

Complete list of printed reports begins on page 367

UNIVERSITY OF MICHIGAN

October 14, 1960

Vol. 34, No. 4

ENGINEERING LIBRARY

. . . A monthly listing of Government research reports available to industry . . .

U. S. DEPARTMENT OF COMMERCE

BUSINESS AND DEFENSE SERVICES ADMINISTRATION

Office of Technical Services

The PB Reports . . .

announced in this publication have just been released, usually by agencies of the U. S. Government, for dissemination to the public. In most instances they result from Government or Government-sponsored research.

The Office of Technical Services is responsible, under Public Law 776, 81st Congress, for the collection and distribution of these technical reports in the interest of American science and industry.

The more important reports are reprinted for sale to the public by OTS. Many of the reports are so specialized that the demand for them does not warrant reproduction of printed copies; originals of these documents are deposited at the Library of Congress. There they may be inspected in the Annex Reading Room, or copies may be ordered from the Library in either photocopy or microfilm.

PB reports of special interest to smaller businesses are abstracted in OTS's monthly *Technical Reports Newsletter*, available from the Superintendent of Documents, Washington 25, D. C., at $1 a year domestic, $1.50 foreign.

Since 1945 thousands of business firms have used PB reports in their research programs. These reports now constitute one of the world's largest collections of non-confidential technical information, numbering over 250,000 items. OTS has published catalogs of related reports in more than 300 areas of industrial interest. For further information relative to any of its activities, you are invited to write OTS, U. S. Department of Commerce, Washington 25, D. C.

Except to the extent indicated by acknowledgment of authorship, OTS does not edit PB reports, nor does it accept responsibility for the information and conclusions contained in them. If copyrighted material appears, permission for its use should be requested from the copyright owners. Any national security restrictions that may have applied to these reports have been removed. Patents may cover the subject matter of any report, and the reader is advised to make patent searches before developing applications based on the reports.

How To Order

ALWAYS USE COMPLETE TITLE AND PB NUMBER of each report ordered. The letter "s" accompanying some PB numbers means "supplement," "t" means "translation," and "r" means a partial or complete revision. These letters should be included as part of the PB number. Prepayment is required.

TO ORDER FROM LC • Address your order to Library of Congress, Photoduplication Service, Publications Board Project, Washington 25, D. C. Make check or money order payable to Chief, Photoduplication Service, Library of Congress. State whether report is desired in microfilm or photocopy. Microfilm copies are in 35 millimeter film and require special reading equipment; if you do not have such a machine you may be able to use one at a library in your area.

TO ORDER FROM OTS • Address your order to Office of Technical Services, U. S. Department of Commerce, Washington 25, D. C. Make check or money order payable to OTS, Department of Commerce. Reports available from OTS may also be ordered through Department of Commerce field offices.

TO ORDER FROM OTHER SOURCES • When an agency other than OTS or LC is the source, use the full address included in the abstract of the report. Make check or money order payable to that agency.

U.S. GOVERNMENT RESEARCH REPORTS

U.S. DEPARTMENT OF COMMERCE
Frederick H. Mueller, *Secretary*

BUSINESS AND DEFENSE SERVICES ADMINISTRATION
William A. White, Sr., *Administrator*

Office of Technical Services
John C. Green, *Director*

Issued monthly. Annual subscription $9 ($2.50 additional for foreign mailing). Single copy $1. Make remittance payable to Superintendent of Documents and mail either to a Department of Commerce field office or to Superintendent of Documents, U.S. Government Printing Office, Washington 25, D.C. Address changes should be sent to Superintendent of Documents.

Contents may be reprinted freely. Mention of source will be appreciated

Use of funds for printing this publication approved by the Director of the Bureau of the Budget, July 18, 1958

Printed Reports Available From OTS Announced in This Issue

ASTRONOMY — Page

Limiting detectivity of optical amplifying equipment. Dec 59. 26p. (PB 161 876) 75 cents ... 372

BEHAVIORAL SCIENCES

A general procedure for systems study. Jan 60. 17p. (PB 161 873) 50 cents ... 373

BIBLIOGRAPHY

Columbium and tantalum. June 60. 14p. (OTS SB-414) 10 cents ... 478
Desalination of water. July 60. 4p. (OTS SB-419) 10 cents ... 417
Food preservation (except by irradiation) (1950-1960). May 60. 10p. (OTS SB-412) 10 cents ... 443
Literature survey on research and development on high pressure technology. Mar 60. 54p. (PB 161 887) $1.50 ... 371
Metal coatings (1950-1960). May 60. 20p. (OTS SB-409) 10 cents ... 476
Molybdenum and tungsten. June 60. 18p. (OTS SB-415) 10 cents ... 478
Photographic chemicals and emulsions. June 60. 8p. (OTS SB-417) 10 cents ... 446
Solar energy applications. July 60. (OTS SB-418) 10 cents ... 371

BIOLOGICAL SCIENCES

Radiological health data. Volume I, No. 3. June 60. 32p. (PB 161 371-3) 50 cents; $3.00/6 mos ... 388
Radiological health data. Volume I, No. 4. July 60. 112p. (PB 161 371-4) 50 cents; $3.00/6 mos ... 388
Radiological health data. Volume I, No. 5. Aug 60. 50p. (PB 161 371-5) 50 cents; $3.00/6 mos ... 388

CHEMISTRY

Fundamental studies of the chemistry and physics of organic materials absorbed on metal substrates. Apr 60. 149p. (PB 161 840) $2.75 ... 397
Introduction to tables on pyrolysis of esters. Pyrolysis of carboxylates. June 60. 87p. (PB 161 866) $2.25 ... 400
Investigation of initial free radical yields in organic compounds subjected to gamma radiation. Apr 60. 46p. (PB 161 849) $1.25 ... 393
Methods of microanalysis. III. Gravimetric determinations of sulfur, phosphorus, bromine and chlorine in organic compounds. Apr 60. 25p. (PB 161 860) 75 cents ... 390
Research on a new class of inorganic molecules consisting basically of sulfur and nitrogen. Apr 60. 22p. (PB 161 883) 75 cents ... 391
Research on hydrogen evolution. Apr 60. 50p. (PB 161 880) $1.25 ... 399

EARTH SCIENCES

A numerical model for the prediction of hurricane formation. Mar 60. 100p. (PB 161 889) $2.25 ... 401

ENGINEERING

Altimeters for low altitude and flareout: An investigation of the state of the art and equipment availability. June 59. 44p. (PB 161 854) $1.25 ... 411
Cryogenic materials data handbook. June 60. 47p. (PB 161 093-4) $1.25 ... 436
Desalination of water. July 60. 4p. (OTS SB-419) 10 cents ... 417

ENGINEERING (con.)

Page

Determination of emissivity and reflectivity data on aircraft structural materials. Part III. Techniques for measurement. Apr 60. 104p. (PB 161 839) $2.50 ... 412
Determination of the mechanical properties of aircraft-structural materials at very high temperatures after rapid heating. Apr 60. 81p. (PB 161 893) $2.25 ... 416
Development, construction, and testing of osmionic demineralizers. June 60. 95p. (PB 161 862) $2.25 ... 417
Effects of cabin atmospheres on combustion of some flammable aircraft materials. Apr 60. 32p. (PB 161 841) $1.00 ... 411
High speed communications equipment. 226p. (PB 161 858) $3.50 ... 413
Hyperbolic coordinate converter. Jan 60. 154p. (PB 161 853) $3.00 ... 413
Method for determining the economic value of air traffic control improvements and application to all-weather landing systems. Volume I. (1960) 28p. (PB 161 852) 75 cents ... 416
On stress interaction in fatigue and a cumulative damage rule. Part II. 7075 aluminum alloy. Jan 60. 23p. (PB 161 837) 75 cents ... 412
Piezoelectric force gage for measuring drag on two-dimensional models in the shock tube. Apr 59. 61p. (PB 161 872) $1.75 ... 437
Prefabricated airfield and road surfacing membranes: Torrid zone storageability tests. May 60. 32p. (PB 161 869) $1.00 ... 417
Runway characteristics and performance of jet transports in routine operation. Volume I. Mar 60. 104p. (PB 161 856-1) $2.50 ... 411
Runway characteristics and performance of jet transports in routine operation. Volume II. Appendix E. Tabulation of basic data. Mar 60. 281p. (PB 161 856-2) $4.00 ... 412
Runway characteristics and performance of selected propeller-driven aircraft in routine operation. Apr 60. 185p. (PB 161 857) $3.00 ... 412
Specification for a proximity warning indicator: Pilot response evaluation test. Aug 58. 31p. (PB 161 855) $1.00 ... 412

FOOD, HANDLING, AND PACKAGING EQUIPMENT

Food preservation (except by irradiation) (1950-1960). May 60. 10p. (OTS SB-412) 10 cents ... 443

MACHINERY, FABRICATION, AND ACCESSORY EQUIPMENT

Effect of neutron irradiation on the Charpy V and drop-weight test transition temperatures of various steels and weld metals. May 60. 28p. (PB 161 448) 75 cents ... 445

MATERIALS

Alkaline-organic missile component paint removers. June 59. 27p. (PB 161 859) 75 cents ... 451
Detonation induction distances in combustible gaseous mixtures at atmospheric and elevated initial pressures. IV. Hydrogen-nitric oxide. V. Hydrogen-oxygen-diluent. VI. Theoretical analysis. Aug 59. 86p. (PB 161 878) $2.25 ... 450
Development of textile type vitreous silica yarns. Mar 60. 53p. (PB 161 845) $1.50 ... 450
Effect of humidity on the consistency of greases. Apr 60. 14p. (PB 161 861) 50 cents ... 450
Effect of temperature on the luminance of phosphorescent and fluorescent materials used for aids to military activity in the dark. Oct 59. 11p. (PB 161 005) 50 cents ... 451
Handbook for hydrogen handling equipment. Feb 60. 589p. (PB 161 835) $7.00 ... 449
Hot pressing of fine grained ceramic oxides for use in thermal conductivity studies. Feb 60. 32p. (PB 161 851) $1.00 ... 447
Investigation of sinterable powders and properties of beryllia ceramics. Apr 60. 24p. (PB 161 891) 75 cents ... 447
Lubrication behavior or liquid metals. Mar 60. 76p. (PB 161 888) $2.00 ... 450

MATERIALS (con.)

Page

Photographic chemicals and emulsions. June 60. 8p. (OTS SB-417) 10 cents ... 446
Plastic coefficients for work-hardening materials. Apr 60. 17p. (PB 161 886) 50 cents ... 446
Stabilization of silicone lubricating liquids above 200°C. Part I. Conventional oxidation inhibitors and some high-surface solids. June 60. 33p. (PB 161 314) $1.00 ... 449

MATHEMATICS

Treatment errors in comparative experiments. Apr 60. 83p. (PB 161 874) $2.25 ... 457

MECHANICS

Recent developments connected with hypersonic facility of the Polytechnic Institute of Brooklyn. Part I. Tests of the compression heater. Part II. Aspects of the design, construction, and installation on a multiple-outlet collection for the convection heater. Oct 59. 29p. (PB 161 882) 75 cents ... 472
Research on evaporative film cooling of a Mach Number 7 contoured wind tunnel nozzle in the Rosemount Aeronautical Laboratories' hypersonic facility. May 60. 63p. (PB 161 885) $1.75 ... 473

METALLURGY

Columbium and tantalum. June 60. 14p. (OTS SB-414) 10 cents ... 478
Corrosion of superalloys by selected fused salts. Mar 60. 84p. (PB 161 848) $2.25 ... 480
Effects of inelastic action on the resistance to various types of loads of ductile members made from various classes of metals. Part XII. Eccentrically-loaded tension members and columns made of 17-7PH stainless steel and Ti 155A titanium alloy and tested at various temperatures. Feb 60. 84p. (PB 161 836) $2.25 ... 480
Effects of stored energy and recrystallization on the creep rupture properties of internally oxidized copper-alumina and copper-silica alloys. Dec 59. 27p. (PB 161 846) 75 cents ... 481
Electrodeposition of aluminum on magnesium. Nov 59. 30p. (PB 161 892) 75 cents ... 476
Electron microscopy of etch pits. Oct 59. 29p. (PB 161 838) 75 cents ... 481
Mechanical property forecaster for titanium alloys. Sep 59. 16p. (PB 161 018) 50 cents ... 482
Mechanism of hardening in 17-7PH stainless steel. June 60. 54p. (PB 161 850) $1.50 ... 476
Metal coatings (1950-1960). May 60. 20p. (OTS SB-409) 10 cents ... 476
Molybdenum and tungsten. June 60. 18p. (OTS SB-415) 10 cents ... 478
Physical properties of some nickel-base alloys. May 60. 137p. (PB 151 086) $2.75 ... 480
Polarization capacitance determinations of surface roughness. Apr 60. 39p. (PB 161 847) $1.00 ... 479
Research on techniques for the production of ultra-pure beryllium. Mar 60. 55p. (PB 161 877) $1.50 ... 477
Use of radioactive iodine vapor for determining surface roughness. Dec 59. 48p. (PB 161 844) $1.25 ... 479

MISCELLANEOUS

Report of NRL progress. Aug 60. (PB 161 284) $1.25, $10.00/year ... 514

NUCLEAR PHYSICS AND NUCLEAR CHEMISTRY

Attempt to evaluate chlorinated hydrocarbon dosimeters by cross calibrating eleven gamma ray sources. Nov 59. 18p. (PB 161 875) 50 cents ... 485

Page

NUCLEAR PHYSICS AND NUCLEAR CHEMISTRY (con.)

Optically active organic compounds as high level gamma dosimeters. Feb 60. 39p. (PB 161 881) $1.00 485
Research on scintillation crystals and their activators. I. Zone melting and zone leveling of LiI (Tl). II. Compaction and activation of scintillators. III. Effect of color centers on the scintillation of KI(Tl). July 58. 67p. (PB 161 870) $1.75 484

PHYSICS

Arc image furnace for growing semiconductor crystals. Mar 60. 116p. (PB 161 868) $2.50 500
Effect of plastic strain rate on diffusion in aluminum-zinc alloys. Apr 60. 51p. (PB 161 884) $1.50 498
References to research on high-emissivity surfaces. June 60. 11p. (PB 161 207) 50 cents. 505

LITERATURE SURVEY ON RESEARCH AND DEVELOPMENT ON HIGH PRESSURE TECHNOLOGY, by Lawrence Berg and Harry Herman. Rept. for June-Oct 59 on Metallic Materials, Contract AF 33(616)6729. Mar 60, 54p. 295 refs. WADC Technical rept. 59-730.
Order from OTS $1.50 PB 161 887

This bibliography lists alphabetically by author the results of a survey of available literature, both foreign and domestic, classified and unclassified, in the field of high pressure technology. The compiled information includes, for each article, the title, source, page number, number of pages, Chemical Abstract number (CA) Physical Abstract number (Ph. A.), and a general description of the subject matter. Co-authors of any given publication have been cross-referenced. It is intended to reissue this report from time to time as new authors emerge and new publications are reviewed. (Author)

ASTRONOMY

Air Force Missile Development Center, Holloman AFB, N. Mex.
PLANETARY ASTRONOMY FROM SATELLITE-SUBSTITUTE VEHICLES, by John D. Strong, Gérard H. de Vaucouleurs, and Fritz Zwicky. Mar 60, 163p. 142 refs. AFMDC-TR-60-6; AD-234 813.
Order from LC mi$7.80, ph$25.80 PB 146 964

Contents:
A review of meteorological and astrophysical programs for observatories carried effectively into space by satellite-substitute vehicles
A survey of physical problems of the nearer planets and a review of observational techniques applicable to balloon-borne telescope systems
Program for novel observations from high altitude balloons
(See also PB 145 737)

Air Force Missile Development Center, Holloman AFB, N. Mex.
PLANETARY ASTRONOMY FROM SATELLITE-SUBSTITUTE VEHICLES. II. A SURVEY OF PHYSICAL PROBLEMS OF THE NEARER PLANETS AND A REVIEW OF OBSERVATIONAL TECHNIQUES APPLICABLE TO BALLOON-BORNE TELESCOPE SYSTEMS, by Gerard de Vaucouleurs. Dec 59, 128p. 123 refs. AFMDC-TN-59-37; AD-233 561.
Order from LC mi$6.30, ph$19.80 PB 146 381

A survey is presented of the various techniques immediately available, or soon to become practicable, to solve the main outstanding problems of planetary astronomy. Particular attention is given to the nearer planets, Venus, Mars, and Mercury, which together with the earth form the so-called terrestrial planets group. Special emphasis is placed on the potentialities of balloon-borne instrumentation and on proven techniques rather than experimental developments. (Author) (See also PB 143 187)

Yerkes Observatory [Williams Bay, Wis.]
THE HYDROGEN EMISSION LINES IN POPULATION II VARIABLE STARS, by Robert P. Kraft (Yerkes and McDonald Observatories) David C. Camp, and William T. Hughes (Goethe Link Observatory). Rept. on Contract Nonr-2323(00). [1959] 15p. 23 refs. AD-219 583.
Order from LC mi$2.40, ph$3.30 PB 146 354

Three groups of variables generally assigned to Population II are considered: RR Lyrae Stars, W Virginis stars, and high-velocity long-period variables. If t is the time hydrogen emission is present in the spectra of these stars, and P is the period, it is shown that

log t ∝ log P. If one assumes that strong shock waves are responsible for the emission, it is found that the strength of the Hβ emission in W Vir can be predicted. It is suggested that the pulsation constant is the same for the stars in all 3 groups, and that the mass of a high-velocity long-period variable is of the order of 1μ.

Ohio State U. Research Foundation, Columbus.
RADIO STAR SCINTILLATION AT 915 Mc, by H. C. Ko. Final rept. on Contract AF 19(604)1591. Apr 59, 48p. 21 refs. Radio Observatory rept. no. 12. AFCRC-TR-59-182; AD-225 686.
Order from LC mi$3.30, ph$7.80 PB 146 611

Observations of radio star scintillation at 915 mc over a 12-month period (October 1957-September 1958) are described. By daily observations of the star constellation Cygnus A (IAU 19N4A) over a wide range of elevation angles, both the amplitude and rate of scintillation were studied. Results show that the amplitude of scintillation is strongest near the horizon and decreases rapidly as the altitude increases. The amplitude of the intensity fluctuation ranges from less than 3% to over 50% of the undisturbed intensity while the rate of fluctuation varies from 1/2 to 8 peaks per min. The fluctuation amplitude was greater than 10% at low altitudes for 71% of the total observations. The frequency of occurrence of scintillation had two maxima: one in the winter and the other in the summer. During these periods the mean fluctuation amplitude was higher than during other periods. The mean fluctuation rate in the winter is about 3 times faster than that in the summer. (Author)

Aeronautical Instruments Lab., Naval Air Development Center, Johnsville, Pa.
THE EFFECT OF CELESTIAL BODIES ON THE GRAVITATIONAL CONSTANT OF THE EARTH, by Ronald S. Vaughn. Technical note. 15 Oct 59, 19p. 3 refs. Rept. no. NADC-AI-5990(TN); AD-231 985.
Order from LC mi$2.40, ph$3.30 PB 146 963

The gravitational potential at a point near the earth due to the moon and the sun is evaluated in terms of the net specific force with respect to the earth. The maximum possible value near the earth's surface is shown to be about 2.4×10^{-7} g. A constant residual is shown to affect the interpretation placed on the measured value of the earth's gravitational constant. This effect is about 4.5×10^{-6} g. (Author)

THE LIMITING DETECTIVITY OF OPTICAL AMPLIFYING EQUIPMENT, by R. K. H. Gebel and Lee Devol. Dec 59, 26p. WADC Technical note 59-405.
Order from OTS $0.75 PB 161 876

The limits in the ability to detect very faint stars in the presence of the sky background by conventional photography and by employing optical amplification are investigated and compared in this paper. Equations are developed which show the effects of the different variables involved for three types of imaging system; the conventional photographic system, the image-converter, and the closed circuit television type of optical amplifier. In this paper, the last named system is found capable of detecting smaller differences in brightness than the two other systems. (Author)

BIBLIOGRAPHY OF EXTRATERRESTRIAL RADIO NOISE: QUARTERLY LIST OF RECENT PUBLICATIONS [NO. 6] by Martha Stahr Carpenter. Rept. on Contract Nonr-401(22) and National Science Foundation Grant G5964. 15 Dec 58, 19p. 132 refs. Research rept. EE-417.
Order from LC mi$2.40, ph$3.30 PB 148 345

Most of the references pertain to material received between 1 Sep 58 and 1 Dec 58. Also included are certain references to earlier publications that were not mentioned in previous "Quarterly Lists," and a few revised statements of previously listed references about which further information is now available. (See also PB 146 094)

Cornell U., School of Electrical Engineering, Ithaca, N. Y.
RADAR ECHO FROM A ROUGH ROTATING PLANET, by M. H. Cohen. Technical rept. no. 1 on Radio Astronomy, Contract Nonr-401(27). 1 June 59, 23p. 7 refs. Research rept. EE-428; AD-225 628.
Order from LC mi$2.70, ph$4.80 PB 146 587

An assumption is made that the reflection properties of a planet are like those of a rough rotating sphere. A monochromatic wave incident on such a body has an echo whose spectrum is shown to be of the form, $I(\nu) = I_m [1 - 2(\nu - \nu_m)^2/B^2]$ where I is the spectrum, ν is the frequency, and m is the peak intensity. The effect of orbital motions on the width, B, of the spectrum of the echo is deduced. Earth-Mars and Earth-Venus situations are considered. Measurements of B for Venus over a range of orbital positions may fix the rotation period and the heliocentric ecliptic latitude and longitude of the pole, except for one ±ambiguity. If a 2-wk rotation period for Venus is assumed, B has a maximum value of 120 c. (Author)

Iowa State U., Iowa City.
INSTRUMENTATION FOR AURORAL ZONE BALLOON EXPERIMENTS AND SUMMARY OF FIELD OPERATIONS, by Donald C. Enemark and Kinsey A. Anderson. [Rept. on Contract N9onr-938(03)]. June 59, 28p. 4 refs. Rept. SUI-59-17; AD-219 097.
Order from LC mi$2.70, ph$4.80 PB 146 705

Twelve balloon flights were made to obtain information on high latitude cosmic ray effects and x-ray occurring in connection with magnetic storms and other geophysical or solar phenomena. Approximately 150 hours of data were obtained above 100,000 ft altitude (30 Km). Five flights were made from Fairbanks, Alaska, during April, 1959. This site was chosen because of the very low ground winds encountered there which would facilitate launching large volume balloons. These were desired in order to make measurements with an auroral photometer at altitudes where the Rayleigh scattered sunlight was comparable with auroral brightness. Another feature of the extreme altitude flights was the possibility of studying x-ray effects at very small atmospheric depths. (Author)

STUDIES OF CORRELATIONS BETWEEN UPPER ATMOSPHERE VARIABLES IN THE AURORAL ZONE, by Bengt Hultqvist, Alv Egeland and others. Technical summary rept. Task 6, 15 Oct 58-15 Oct 59, on Contract AF 61(514)1314. 26 Oct 59, 28p. 6 refs. AFCRC-TN-60-148.
Order from LC mi$2.70, ph$4.80 PB 148 810

Study of correlations of satellite data, visual aurora, magnetic variations, and VHF auroral reflections.

Kiruna Geophysical Observatory (Sweden).
STUDIES OF TRANSMISSIONS FROM SATELLITES WITH EMPHASIS ON PROPAGATION ASPECTS, by Ludwik Liszka. Technical summary rept. Task 5, 15 Oct 58-15 Oct 59, on Contract AF 61(514)1314. 15 Oct 59, 46p. 3 refs. AFCRC-TN-60-147.
Order from LC mi$3.30, ph$7.80 PB 148 809

This report contains a discussion of the methods of Doppler and signal strength measurements and of the analysis of the measurements of 1958 δ 2 transmissions. The following phenomena have been studied: (1) the shape of the region of reception and its dependence on ionospheric conditions; (2) from observations of Faraday fading some estimates have been made by means of a digital computer of the total electron amount, and of the components of the unit vector of the geomagnetic field in the ionosphere; (3) the sudden fadeouts of signals which seems to be caused by strong absorption in "clouds" existing at heights of about 300 km; (4) a type of variations of the signal strength possibly connected with ionization produced by the satellite.

Kiruna Geophysical Observatory (Sweden).
A STUDY OF AURORAL PROPAGATION OF 90 Mc/s RADIATION, by Johannes Ortner, Alv Egeland, and Sven Olsen. Technical summary rept. Task 1 and 2, 15 Oct 57-15 Oct 59, on Contract AF 61(514)1314, 20 Oct 59, 109p. 19 refs. AFCRC-TN-60-144.
Order from LC mi$5.70, ph$16.80 PB 148 806

Contents:

Part III: Studies of the angular properties of VHF-auroral reflections
Part IV: The aurograph, a recorder for receptions obtained by means of rotary antennas

Kiruna Geophysical Observatory (Sweden).
A STUDY OF TRANSPOLAR HF-PROPAGATION, by Johannes Ortner. Technical summary rept. Task 3, 15 Oct 57-15 Oct 59, on Contract AF 61(514)1314. 30 Oct 59, 100p. 5 refs. AFCRC-TN-60-145.
Order from LC mi$5.40, ph$15.30 PB 148 807

HF pulse propagations on 12, 18 and 24 Mc/s have been studied on the transpolar transmission path College, Alaska - Kiruna, Sweden continuously since 20 May 1958. The technical performance of these experiments is described and the reception signal strength tables are given for the observation period June 1958 to August 1959. The monthly mean signal strength diurnal variation curves are presented. Furthermore some examples of multipath propagation are shown and the effect of strong absorption events on the pulse transmissions is discussed. A GENERAL PROCEDURE FOR SYSTEMS STUDY, by George O. Wright. Jan 60, 17p. 2 refs. WADD Technical note 60-18; AD-236 040.
Order from OTS $0.50 PB 161 873

The creation of an abstract system model is presented. The model is developed around the concepts of process, data input, system output, function, data transformation, mediation, and operation, outcomes and the output criteria, feedback control, and data flow. The system model also is considered in cultural terms. The thesis is set forth that the man-machine complex is a cultural system whose limits are set by culture. The paper also proposes a methodology for system study. The general procedure is to locate appropriate places in the system to manipulate selected variables and to evaluate the resulting changes in the system performance. A set of principles is developed to assist in the choices of the place to intervene as well as the kinds of variables to be manipulated. (Author)

American Inst. for Research [Pittsburgh, Pa.]
TECHNIQUES FOR HUMAN FACTORS EVALUATION OF PROTOTYPE SPECIAL WEAPONS AND ASSOCIATED EQUIPMENT, SUPPLEMENT I, by James W. Shearer, Dan A. Peterson and Edward B. Slebodnick, Rept. on Contract AF 29(601)513. July 59, 81p. AIR-259-59-FR-198-Sup. I: AFSWC-TR-59-14, sup. I; AD-227 333.
Order from LC mi$4.80, ph$13.80 PB 146 598

This booklet is published as a supplement to AFSWC-TR-59-14, Techniques for Human Factors Evaluation of Prototype Special Weapons and Associated Equipment. The appendices to that report consisted of an Instructions Evaluation Guide (IEG) and an Equipment Evaluation Guide (EEG). The former is compiled of some 300 items for evaluating preliminary manuals of job instructions; the latter, of about 500 items for evaluating prototype equipment of various kinds. These supplements contain the cards for both guides. Supplement I contains the cards for the IEG. Supplement II contains the cards for the EEG. The Instructions section describes the order in which the cards should be used.

OPTIMUM SYMBOLS FOR RADAR DISPLAYS, by Hugh M. Bowen, John Andreassi and others. Rept. on Contract Nonr-2682(00). 1 Sep 59, 36p. 47 refs. AD-227 014.
Order from LC mi$3.00, ph$6.30 PB 148 898

Experiments were conducted to determine: (1) sets of geometric symbols each one of which is discriminated and recognized with high accuracy under a variety of display degradation conditions, and (2) the size and strokewidth to height ratio desirable for symbols to be used on complex displays. Recommendations including appropriate dimensions, are made concerning: (1) optimum geometric symbols; (2) size and strokewidth to height ratio; (3) compliance with the informational structure the symbols are representing; (4) the manner in which symbols are to be compounded to form symbol complexes; and (5) agreement with conventional and stereotyped meanings. (Author)

Dynamic Analysis and Control Lab., Mass. Inst. of Tech., Cambridge.
TIME-VARIABLE DYNAMICS OF HUMAN OPERATOR SYSTEMS, by Thomas B. Sheridan. Rept. for Sep 58-Sep 59 on Contract AF 19(604)4548. Mar 60, 125p. 37 refs. Rept. no. 124; AFCRC-TN-60-169.
Order from LC mi$6.30, ph$19.80 PB 147 732

The human operator of a control system is frequently modelled as a several parameter constant coefficient quasi-linear system, with coefficients dependent upon the process dynamics and the input spectrum. However, an important limitation to such a model occurs in precisely that situation where the human controller out performs his mechanical or electronic counterpart. An experimental technique is developed whereby the frequency characteristics of the human operator (or any physical system) are computed in a running fashion as he adapts to sudden changes in parameters of the reference input, the nature of the operator's display, the controlled process, or physiological conditions within himself. The method utilized a "random appearing" reference input which consists of a sum of non-harmonic sinusoids. Experimental results reveal the time-changes of the human operator's transfer characteristics to be quite consistent and almost instantaneous when the operator is experienced.

Personnel and Training

Human Factors Research, Inc., Los Angeles, Calif.
SUPERVISORY RATINGS AND PRACTICAL PERFORMANCE TESTS AS COMPLEMENTARY CRITERIA OF SHIPBOARD PERFORMANCE, by Robert R. Mackie and Wallace S. High. Technical rept. no. 9 on Research on the Development of Shipboard Performance Measures, Contract Nonr-1241(00). June 59, 59p. 15 refs. AD-220 172.
Order from LC mi$3.60, ph$9.30 PB 146 687

This report describes a shipboard follow-up study of the performance of Navy Machinery Repairmen whose aptitudes, skills, interests and achievements had been thoroughly studied two years earlier while they were in Class "A" MR training. Shipboard performance was assessed in two ways: (1) by administering a practical performance test requiring skill in the use of machinery repair equipment; (2) by securing ratings by supervising petty officers of each person's ability to perform the various aspects of the MR's shipboard job. The results strongly suggested that performance tests and supervisory ratings were best regarded as complementary criteria of shipboard performance. When the two shipboard measures were combined to form a simple composite criterion, it was estimated that over 50% of the true variance was accounted for by scores made two years earlier on a combination of scores made on: (1) mechanical knowledge tests; (2) training projects involving the use of lathe and milling machines; and (3) predictions by school instructors as to eventual suitability as an MR. (Author)

A PERFORMANCE REQUIREMENT FOR BASIC LAND NAVIGATION, by Joseph F. Follette. Rept. on Contract DA 49-106-qm-1. Mar 60. 60p. 8 refs. Research rept. no. 4.
Order from LC mi$3.60, ph$9.30 PB 148 318

This report presents the rationale and supporting data that were the basis for establishing a performance requirement and a proficiency standard to be used in evaluating a program of instruction in basic land navigation. The combat reference situation in which navigation ability ultimately will be required was described, and the performance requirement and the means for accomplishing it were assessed. Generation of the requirement was based on characteristics of position defense by a ROCID division. (Author)

Human Resources Research Office, George Washington U., Washington, D. C.
THE REVISION OF NIKE PLATOON LEADER JOB DESCRIPTIONS: AJAX TO HERCULES, by Edgar M. Haverland and Walter J. Fightmaster. Rept. on Contract DA 49-106-qm-1. May 60, 26p. 5 refs. Technical rept. 62.
Order from LC mi$2.70, ph$4.80 PB 148 064

This report describes the sources of information and procedures used to revise the job descriptions of the Nike Ajax integrated fire control platoon leader and launching platoon leader positions to make them applicable to Nike Hercules platoon leader jobs. It outlines the methods found generally useful for revising and developing job descriptions to keep them up to data, and recommends their use by training agencies. The Hercules fire control and launching platoon leader job descriptions developed in this study are included. (Author)

Naval Personnel Research Field Activity, San Diego, Calif.
DEVELOPMENT OF A DOPPLER TEST, by Edward J. Pickering. Oct 59, 19p. 6 refs. BuPers Technical Bulletin 59-27; AD-233 002.
Order from LC mi$2.40, ph$3.30 PB 146 304

Sea-recorded materials were used to: (a) develop and evaluate a test to measure sonarmen's ability to determine Doppler; and (b) provide a set of Doppler items for drills in Doppler training. New test and drill materials were needed because many of the materials available at Fleet Sonar School, San Diego, (FSS/SD) were worn or obsolete. Administration of the experimental 60 item test to 6 classes, 99 students, at the FSS/SD indicated that the test can be expected to accurately discriminate individual differences in Doppler ability. The 50 item Doppler drill which was developed and the test are now in use at the FSS/SD. (Author)

THE DEVELOPMENT OF MEASURES FOR THE EVALUATION OF FT PERFORMANCE, by Kalmer E. Stordahl and J. Howard Bryant. Mar 59, 64p. 8 refs. Technical Bulletin 59-8; AD-233 978.
Order from LC mi$3.90, ph$10.80 PB 147 229

The refinement of prototype procedures and instruments developed to provide economical and effective means for obtaining pertinent and current shipboard data to assess the influence upon personnel performance of policy and program changes is reported.

Naval Personnel Research Field Activity, San Diego, Calif.
AN EXPERIMENTAL INVESTIGATION OF DOPPLER TRAINING, by Edward J. Pickering. Nov 59, 52p. 15 refs. BuPers Technical Bulletin 59-29; AD-233 008.
Order from LC mi$3.60, ph$9.30 PB 146 303

Research and development in Doppler training during and since World War II is described. The effectiveness of Doppler training in improving the ability of sonar students to determine Doppler is evaluated, and planned modifications of Doppler training to increase the effectiveness of Doppler training are investigated. The results of this research indicate that: (1) the average ability of sonar students to judge Doppler is significantly improved through training; (2) the particular instructor who teaches Doppler greatly affects the results of training; (3) students who are poor judges of Doppler before training do not, even though they improve, reach a proficiency level adequate for fleet performance; (4) initially superior judges of Doppler improve through training and do maintain a proficiency level adequate for fleet performance; and (5) from an economics viewpoint more might be accomplished by selecting for Doppler ability than by training poor judges of Doppler. (Author) (See also PB 146 304)

Naval Personnel Research Field Activity, San Diego, Calif.
THE PROFICIENCY OF PACIFIC FLEET SONARMEN IN THE USE OF ELECTRONIC TEST EQUIPMENT, by Adolph V. Anderson and Edward J. Pickering. Nov 59, 30p. BuPers Technical Bulletin 59-30; AD-233 620.
Order from LC mi$2.70, ph$4.80 PB 147 274

A test designed to measure ability to use electronic test equipment was administered to 396 Pacific Fleet sonarmen as part of a general survey of sonar personnel. On the average, the ability of sonarmen to operate volt-ohm meters, vacuum tube volt meters, oscilloscopes, and signal generators was poorer than desirable. Sonarmen below the grade of chief petty officer who were assigned to helicopter squadrons performed at a lower level than sonarmen in other assignments. Possible remedial measures include the development of standard proficiency measures in the practical application of electronic test equipment; the development of one or more experimental training courses in the use of electronic test equipment; administrative action to cause closer agreement between practical factors requirements for sonarmen and performance on electronic test equipment; and the investigation of the feasibility of developing a training device to provide simulated experience in the use of electronic test equipment. (Author)

Naval Personnel Research Field Activity, San Diego, Calif.
A STUDY OF WEIGHTING FACTORS USED IN NROTC SELECTION, by Bernard Rimland. July 59, 28p. 11 refs. BuPers Technical bulletin 59-24; AD-231 132.
Order from LC mi$2.70, ph$4.80 PB 146 344

The weighting of the various selection factors in NROTC NROTC selection was explored. The findings indicate that weighting the Navy College Aptitude Test scores by a factor of 4 and weighting High School Grades by a factor of 6 resulted in the greatest assurance of academic success. In order to predict career motivation it was determined that equal weights should be assigned to the Career Motivation Questionnaire and to the career motivation item on the Interview Form. Though the interview (other than the career motivation item) has never been found to be very valid in the Navy setting, it has in the past been given approximately 50% of all the selection weight by the State Selection Committees. A new selection procedure has been developed

and promulgated by the Chief of Naval Personnel for use by the State Selection Committees. They should result in giving greater weight to the academic and career motivation factors and reducing the effective weight assigned to the interview. (Author)

AN APPLICATION OF LEARNING THEORIES TO THE TRAINING OF RADIO CODE OPERATORS. by Albert K. Kurtz. Technical rept. no. 2 on Contract Nonr-2519(00). Sep 59, 19p. 8 refs. AD-226 228.
Order from LC mi$2.40, ph$3.30 PB 148 612

In order to determine the relative merits of two experimental methods and a control method of training radio code operators to receive International Morse Code at a high rate of speed, Navy recruits undergoing training in radio code were subjected to special instruction, some during the first two, and others during the first 4 weeks of their 24 week course. Some of the learning principles utilized in the experiment were: reinforcement, maintenance of interest, prevention of learning of erroneous responses, unidirectional confusion, overlearning, concentration on difficult material, development of ability to respond to stimulus within varied contexts, realism, and praise and encouragement. The four-week experimental method proved more effective than the two-week method. Although the results of tests with the control group were slightly higher than those with the experimental four-week group, it was felt that the experimental method may actually be superior to the control method. Apart from teaching effectiveness, the experimental method produced an intrinsically more interesting course than the control method, and it was suggested that some of the former's characteristics might be used in the later stages of the twenty-four week course to combat monotony. This should improve the present low morale of radio code students.

Psychological Corp., New York.
RECENT DEVELOPMENTS, PRACTICES, AND RESEARCH IN THE FIELD OF CODE LEARNING, by Albert K. Kurtz. Technical rept. no. 1 on Contract Nonr-2519(00). Sep 59, 54p. 45 refs. AD-227 063.

PROBABILITY AND STATISTICS IN ITEM ANALYSIS AND CLASSIFICATION PROBLEMS. SOME RESULTS ON THE DISTRIBUTION OF THE W-CLASSIFICATION STATISTIC, by Rosedith Sitgreaves (Teachers Coll., Columbia U.). Sep 57, 23p. 4 refs. Rept. 58-3: AD-157 697.
Order from LC mi$2.70, ph$4.80 PB 146 181

The classical problem of classification is concerned with classifying an individual as coming from one of two populations, on the basis of p measurements made on him. It is assumed that the p measurements have a multivariate normal distribution in each population with the same covariance matrix but with different mean values. The parameter values are unknown but can be estimated from samples of known population. The present paper gives a series representation for the sampling distribution of the classification statistic W, proposed for this problem by Anderson, in the case when the two samples of known population are of equal size. RELATIONSHIP BETWEEN PREADMISSION VARIABLES AND SUCCESS IN COLLEGE, by Paul Horst. Rept. on Contract Nonr-477(08) and Public Health Research Grant M-743(C3). June 59, 121p. AD-219 274.
Order from LC mi$6.30, ph$19.80 PB 146 691

The relationships between certain preadmission and college success variables, as determined by grade point averages, were studied. Three general types of admissions variables were analyzed: (a) high school grades, (b) number of high school units, and (c) test scores. The main part of the study was concentrated on the group of students entering the University of Washington in the fall of 1955, but data from the entering classes of 1953 and 1954 were also included for comparative purposes. In all, over 7,500 students were included. The results of the study indicate that: (1) the best preadmission predictors vary greatly from one college course area to another; (2) the best group of predictors are the high school grade point averages; (3) the next best group of predictors are test scores; (4) number of high school units are, in general, poor or very poor predictors of college success as measured by grade point averages; (5) the single best preadmission variable is the all academic high school grade point average; and (6) the grade predictions based on a number of different high school grade

averages and test scores are better predictors of college success than all academic high school grade point average. (Author)

THE USE AND DESIGN OF SYNTHETIC TRAINERS FOR MILITARY TRAINING, by Dael Wolfle. 6 July 45, declassified 8 Mar 55. 42p. 37 refs. OSRD rept. no. 5246; ATI-35 348.
Order from LC mi$3.30, ph$7.80 PB 146 809

A good trainer has three essential characteristics: (1) practice on the trainer leads to substantial improvement on the equipment the men are being trained to operate; (2) a good trainer provides reliable information on the quality of the men's performance; (3) mechanically and electrically it is as simple and rugged as possible. It is necessary to plan carefully an instructional program using a trainer. Instructions for the proper use of a trainer should be prepared as the trainer is being developed, and distributed with the trainer. Trainers possess some advantages over real equipment for practice. (1) They are generally safer, more economical, and more readily available. (2) On a trainer it is possible to break up a complex task into simpler elements. (3) It is usually easier to give men exact information about their errors and successes on a trainer than on real equipment. The steps to follow in developing a new trainer or in evaluating an existing one are outlined in this report.

Applied Mathematics and Statistics Labs., Stanford U., Calif.
APPLICATION OF STIMULUS SAMPLING THEORY TO SITUATIONS INVOLVING SOCIAL PRESSURE, by Patrick Suppes and Franklin Krasne. Technical rept. no. 24 on Contract Nonr-225(17). 10 Sep 59, 39p. 12 refs. AD-226 681.
Order from LC mi$3.00, ph$6.30 PB 148 614

The hypothesis that ultimately group behavior can be explained entirely in terms of the behavior of the individuals who constitute the group is presented. The quantitative formulations of stimulus-response-reinforcement theory provide the conceptual tools for effecting this assumption. An interaction situation is conceived of as one in which each member of a group provides stimuli and reinforcements for every other member of the group with the behavior of each member entirely explicable on an individual basis, given the sequence of stimuli and reinforcements impinging on him. In the social situation objective stimuli and the behavior of other members of a group combine to form the relevant stimulus situations for each subject. It is felt that considerable analytic advantage is derived from the application of a quantitative theory of individual behavior. Through its use it is possible to make highly specific deductions about the extent of operation of certain events which are not directly observable but which may reasonably be postulated to exist; i. e., secondary self-reinforcement of responses well established in everyday experience. The magnitude of the effects of these secondary reinforcements is compared to that of the more directly controlled social support.

Applied Mathematics and Statistics Labs., Stanford U., Calif.
STIMULUS SAMPLING THEORY FOR A CONTINUUM OF RESPONSES, by Patrick Suppes. Technical rept. no. 25 on Contract Nonr-225(17). 11 Sep 59, 38p. 4 refs. AD-226 640.
Order from LC mi$3.00, ph$6.30 PB 148 615

Stimulus sampling theory is extended to situations involving a continuum of possible responses. The experimental situation consists of a sequence of trials. On each trial the subject makes a response from a continuum of possible responses. His response is followed by a reinforcing event indicating the correct response for that trial. Stimulus sampling theory requires a complicated process which involves the conditioning and sampling of stimuli. The postulate is given that the conditioning of each stimulus is smeared over a certain interval of responses, possibly the whole continuum. Thus, the conditioning of any stimulus may be represented by a smearing distribution. Conditioning, sampling and response axioms are presented which state specific hypotheses about the assumed sequence of events on any trial. General theorems are given, and cases of noncontingent reinforcement are examined.

California U., Berkeley.
THE STABILITY OF PERSONALITY RATINGS OVER TWO DECADES, by Read D. Tuddenham. Technical rept. no. 3 on Adolescent Growth Study, Contract [Nonr-222(14)]. 1957, 39p. 9 refs.
Order from LC mi$3.00, ph$6.30 PB 148 822

The present report is concerned with the stability of a broad variety of personality ratings, an important class of variables often used in psychological research as criterion measures. The findings are offered despite certain methodological shortcomings--few cases and a lack of strict comparability in the "before" and "after" rating contexts--because of the extreme paucity of such reports, and because of the light the results throw upon the predictive validity of ratings explicitly intended to tap different levels of personality organization.

California U., Berkeley.
STUDIES IN CONFORMITY AND YIELDING. III. THE SEX COMPOSITION OF THE GROUP AS A DETERMINANT OF YIELDING TO A DISTORTED NORM, by Read D. Tuddenham, Philip D. Macbride, and Victor Zahn. Technical rept. no. 4 on Contract [Nonr-222(14)]. 1958, 8 refs.
Order from LC mi$2.40, ph$3.30 PB 148 823

This report describes an experiment intended to explore the influence upon yielding of the structure of the normative social situation and the qualities attributed to those who compose it.

California U., Berkeley.
STUDIES IN CONFORMITY AND YIELDING. IV. THE INFLUENCE UPON JUDGMENT OF AN AVOWEDLY DISTORTED NORM, by Read D. Tuddenham. Technical rept. no. 5 on Contract [Nonr-222(14)]. 1958, 29p. 5 refs.
Order from LC mi$2.70, ph$4.80 PB 148 824

A norm need not be believed to exert influence, and the effectiveness of palpably false propaganda may become somewhat more intelligible. To explore this matter further, an earlier experiment on yielding was repeated exactly, except for explaining to the subjects that the alleged norm was itself distorted and not always trustworthy. (See also PB 148 823)

California U., Berkeley.
STUDIES IN CONFORMITY AND YIELDING. V. THE INFLUENCE UPON JUDGMENT OF A MODERATELY DISTORTED NORM, by Read D. Tuddenham. Technical rept. no. 6 on Contract [Nonr-222(14)]. 1958, 15p. 4 refs.
Order from LC mi$2.40, ph$3.30 PB 148 825

The present experiment attempts, under conditions of laboratory control, to investigate the more typical situation in which the discrepancy between self and others is moderate, and the group norm, if not veridical, is at least not grossly false. In this treatment, tension arising from awareness of discrepancy between self and others is much reduced, but the validity of the norm is not undermined. This paper describes the individual and group differences which result as compared with the other experimental variations. It is specifically concerned with whether reduced pressure produces a substantial number of nonyielders, or whether the relatively greater acceptability of the pseudonorm actually enhances its influence upon judgment. (See also PB 148 824)

California U., Berkeley.
STUDIES IN CONFORMITY AND YIELDING. VI. THE INFLUENCE UPON JUDGMENT OF A GENUINE NORM, by Read D. Tuddenham. Technical rept. no. 7 on Contract [Nonr-222(14)]. 1958, 13p. 5 refs.
Order from LC mi$2.40, ph$3.30 PB 148 826

The present paper describes the limiting case when the norm itself is genuine and undistorted, but all other variables of the situation match those of the previous experiments. While formally related to the previous studies, the present variation is properly a study of conforming rather than of yielding, since the subjects need not surrender their own judgments to accept those of the group. The two hypotheses of this investigation were suggested by previous experiments, and may be stated as follows: first, a norm which does not conflict with individual experience induces convergence of judgment in the group; second, this convergence is more marked the greater the ambiguity of the stimulus situation, i.e., most marked on opinions, least marked on visual discriminations. (See also PB 148 825)

California U., Berkeley.
STUDIES IN CONFORMITY AND YIELDING. VII. SOME CORRELATES OF YIELDING TO A DISTORTED GROUP NORM, by Read D. Tuddenham. Technical rept. no. 8 on Contract [Nonr-222(14)]. 1958, 16p. 11 refs.
Order from LC mi$2.40, ph$3.30 PB 148 827

The present report is concerned with the correlations between yielding score and a variety of other scores and ratings available on the experimental subjects. (See also PB 148 826)

California U., Berkeley.
STUDIES IN CONFORMITY AND YIELDING. VIII. THE YIELDING EXPERIMENT FROM THE POINT OF VIEW OF THE SUBJECT, by Read D. Tuddenham and Philip D. Macbride. Technical rept. no. 9 on Contract [Nonr-222(14)]. 1958, 33p. 11 refs.
Order from LC mi$3.00, ph$6.30 PB 148 828

The present paper pursues the inquiry further by considering what experimental subjects had to say about their experience, and what relationships exist between the way a subject perceived the situation and his tendency to yield. (See also PB 148 827)

California U., Berkeley.
STUDIES IN CONFORMITY AND YIELDING. IX. INFLUENCE OF CONFIDENCE UPON RESISTANCE OF PERCEPTUAL JUDGMENTS TO GROUP PRESSURE, by Philip D. Macbride. Doctoral thesis. Technical rept. no. 10 on Contract [Nonr-222(14)]. 1958, 40p. 10 refs.
Order from LC mi$3.00, ph$6.30 PB 148 829

The present research explored the relationship between confidence and yielding. It was hypothesized that yielding is an inverse function of confidence and that confidence in one's perceptual judgments is at least in part dependent on the accuracy with which one has made similar judgments in the past. Two principal questions were investigated: (1) do subjects who are "good" at a given perceptual task, that is, make few errors, yield less than subjects who are not? and (2) will subjects who are forced to make errors on a training series subsequently yield more than subjects who are not? (See also PB 148 828)

California U., Los Angeles.
A THEORY OF STIMULUS DISCRIMINATION LEARNING, by Richard C. Atkinson. Technical rept. no. 1 on Contract Nonr-233(58). 11 May 59, 38p. 20 refs.
Order from LC mi$3.00, ph$6.30 PB 146 602

This paper presents a theory of discrimination learning. For simplicity, the analysis will be restricted to situations where only one of two stimuli is presented on each trial; the subject's task is to learn to respond appropriately to them. However, the theory can be readily generalized to situations involving more than two stimuli. The experimental situation involves a series of discrete trials. On each trial one of two stimuli (S_1 or S_2) is presented. To the presentation of S_1, the subject makes one of two responses (A_1 or A_2); these responses are mutually exclusive and exhaustive.

Colorado U., Boulder.
SOME PERSONALITY CORRELATES OF CONCEPT CHANGE BY ENTERTAINMENT OF CONTRADICTORY PREMISES, by O. J. Harvey and Don Beverly (U. of Florida). Technical rept. no. 1 on Contracts Nonr-1147(07) and Nonr-2149(02). [1959] 22p. 19 refs. AD-225 586.
Order from LC mi$2.70, ph$4.80 PB 148 564

Under the assumption that concepts or opinions once formed channel an individual's cognitive functioning and blind him to alternatives not implied in the concept, 137 subjects (Ss) were exposed to treatments designed to render their conceptual schema less closed. Individuals higher in authoritarianism were assumed to be more disposed toward keeping their concepts intact. Subjects with a strong stand against the sale and drink of alcohol were exposed to a communication favoring sale of alcohol which was presented to them as having come from a source of either high or low authoritativeness. Following exposure to the communication, half of the Ss were retested on their attitudes toward alcohol (No Role condition) while the other half were retested after they had written arguments in favor of alcohol (Rode condition). Subjects were also tested on their accuracy of perception of the major arguments in the communication. The more authoritarian Ss showed less change in their opposition to alcohol following their presentation of arguments favorable to it. They also failed to perceive the main arguments of the pro-wet communication to an extent significantly greater than did Ss lower on this dimension. The authoritativeness of source did not significantly interact with authoritarianism and role playing was expected.

DEVELOPMENT OF THE TEST "FORMULATING" HYPOTHESES", by Norman Frederiksen. Rept. on Contract Nonr-2338(00). June 59, 26p. AD-218 573.
Order from LC mi$2.70, ph$4.80 PB 146 407

The steps in the development of an experimental test called Formulating Hypotheses are described. The test is intended to measure ability to interpret data in the manner of a research scholar who is trying to make sense of research findings. Statistical results obtained in the course of development of the test are described. (Author)

Educational Testing Service, Princeton, N. J.
EXPERIMENTAL STUDIES OF HOMOGENEOUS GROUPING. A REVIEW OF THE LITERATURE, by Ruth B. Ekstrom. Rept. on Contract Nonr-2214(00). Apr 59, 30p. 44 refs.
Order from LC mi$2.70, ph$4.80 PB 146 461

The findings of this survey can be divided into three major groups: (a) thirteen studies which found differences, having or approaching significance, favoring homogeneous grouping, (b) fifteen studies which found no differences in achievement in homogeneous or heterogeneous groups, or which found homogeneous grouping detrimental, and (c) five studies which gave mixed results, partially favorable and partially unfavorable to homogeneous grouping. The studies covered grade levels from elementary school through college and dealt with a wide range of subject matter. No consistent pattern for the effectiveness of homogeneous grouping was found to be related to age, ability level, course content, or method of instruction.

Family Relations Center, San Francisco, Calif.
CHANGES IN NONCONFORMIST ATTITUDES INDUCED BY CLOSED LIVING GROUPS, by E. K. Gunderson, J. Douglas Grant, and Kelley B. Ballard. Technical rept. no. 12 on The Rehabilitation of Naval Disciplinary Offenders, Contract Nonr-1535(00). 28 July 59, 31p. 7 refs. AD-226 285.
Order from LC mi$3.00, ph$6.30 PB 147 187

The relationship of attitude-change of delinquency-prone subjects to the following factors in the closed living group design was studied: (1) subject's maturity level; (2) effectiveness of the supervisory team; (3) interaction of these variables; (4) the maturity level of the group; and (5) duration of the supervisor-group relationship. The findings indicated that delinquency-prone attitudes could be significantly reduced in high maturity confinees by utilizing a closed living group program with effective supervision over a period of 9 weeks. High maturity confinees have a potential for attitude-change, but, unless subjected to an appropriate retraining program, this potential is not realized.

Family Relations Center, San Francisco, Calif.
THE RELATIONSHIP OF DELINQUENCY POTENTIAL SCALE SCORES OF NAVAL RECRUITS TO LATER MILITARY PERFORMANCE, by E. K. Gunderson, Kelley B. Ballard, and P. S. Huge. Technical rept. no. 9 on The Rehabilitation of Naval Disciplinary Offenders, Contract Nonr-1535(00). 8 July 59, 27p. 6 refs. AD-226 283.
Order from LC mi$2.70, ph$4.80 PB 147 186

A 119-item scale for measuring delinquency-prone social attitudes was administered to a sample of 20,000 Navy recruits. A follow-up survey of the military records of these men was made 3 yr later. From this survey a sample of 1339 men who had shown serious nonconformity and 882 men with clear records high conduct marks was obtained. The following variables were studied to determine their relationship to later delinquent behavior: (1) age at enlistment; (2) school grade completed; (3) General Classification Test scores; (4) Armed Forces Qualification Test scores; and (5) scores on the Camp Elliott Delinquency Potential Scale (DP). Applying the criteria 17 years of age, tenth grade or less education, and DP score above 24 in recruit screening should reduce the number of serious disciplinary offenders in the fleet by almost 20% while eliminating only 8% of the total recruit population. The majority of the nonoffenders screened out would be of poor or marginal quality for the Naval service.

Family Relations Center, San Francisco, Calif.
RESTORATION PREDICTION SCALES, by Kelley B. Ballard, R. R. McHenry and J. Douglas Grant. Technical rept. no. 14 on Rehabilitation Research, Contract Nonr-1535(00). 28 July 59, 14p. 4 refs. AD-226 391.
Order from LC mi$2.40, ph$3.30 PB 147 188

Over the past four years, an attitude test consisting of true-false items has been administered to Navy and Marine court-martialed prisoners as they entered a Retraining Command. The items have been repeatedly analyzed against a success-upon-restoration-to-duty criterion. Resulting scales have low reliabilities and validities. However, poor as these scales are, they have norms which suggest that 50% of the confinees could be returned to duty with an 85% success rate. Present screening returns 50% with less than 60% succeeding. A separate report will cover efforts at restoration prediction based upon forced-choice responses at times of release from confinement. It may be that

several components such as these can be combined into a more powerful predictive instrument. (Author)

ASSOCIATIVE STUDIES OF COMPLEX CLUSTERING EFFECTS, by Charles N. Cofer. Technical rept. no. 26 on Learning, Retention, and Recovery of Meaningful Material, Contract Nonr-595(04). June 59, 15p. 5 refs. AD-220 522.
Order from LC mi$2.40, ph$3.30 PB 146 689

Associative data are presented which seem to be consistent with the general notion that the complex clustering effects reported by Gonzales and Cofer (AD-209 896) are probably attributable to shifts in distributions of associated responses as a consequence of various arrangements of modifiers. The 6 complex clustering effects which were discussed are: (1) specificity effect; (2) inappropriate modification effects; (3) mediation effects; (4) mediated conflict effects; (5) mediated facilitation effects; and (6) adverb-verb effects.

Maryland U., College Park.
IMMEDIATE RECALL OF SENTENCES AND THE FACTORS OF MEANINGFUL AND ASSOCIATIVE RELATIONS AMONG SOME OF THEIR CONSTITUENT WORDS, by Charles N. Cofer and Jean C. Holroyd. Technical rept. no. 24 on Learning, Retention, and Recovery of Meaningful Materials, Contract Nonr-595(04). June 59, 15p. 6 refs. AD-220 230.
Order from LC mi$2.40, ph$3.30 PB 146 690

Experiment failed to find evidences in recall of sentences of effects of having nouns and/or adjectives categorized or not. Expectations based on an earlier report by Gonzalez and Cofer (1958) were thus not realized. However, evidence was obtained that associative connections among words, as measured in a free association test, may affect recall under some conditions. (Author)

VARIABLES UNDERLYING SOCIOMETRIC STATUS, VII. AN EXPERIMENTAL STUDY OF IDIOSYNCRATIC BEHAVIOR AND STATUS, by E. P. Hollander. Technical rept. on Contract Nonr-1849(00). May 59, 12p. 2 refs. AD-233 054.
Order from LC mi$2.40, ph$3.30 PB 146 522

A study is presented to test the view that leadership status, measured in terms of influence acceptance, is affected by both the leader's task competence and his conformity or non-conformity over time. Data were gathered in a laboratory setting from 12 groups of 5 members each, one of whom was a confederate who had manifestly high task competence over the total of 15 trials and was used as a stimulus person. Nonconformity by him to the agreed upon procedural norms of the group was introduced experimentally at various times, e.g., early or late, by zones of 5 trials each. Influence was measured by the number of trials per zone of 5 in which the confederate's recommended solution was accepted as the group's choice. The overall increase in influence acceptance over the total of 15 trials was quite marked as a function of the accumulation of successive evidences of task competence by the confederate. But within this broad effect it was found that the absence of past non-conformity by the stimulus person was positively related to the group's acceptance of his influence. However, there was an interaction effect in the predicted direction such that non-conforming behavior after a zone of conforming behavior yielded high influence acceptance. (Author) (See also PB 145 214)

Psychological Labs., Harvard U., Cambridge, Mass.
INFORMATION AVAILABLE IN A BRIEF VISUAL PRESENTATION. by George Sperling (Bell Telephone Labs.). Appendix A included in Final rept. 29 May 57-31 Jan 59, on Contract AF 33(038)14343. 31 Dec 59, 56p. 85 refs. AFCRC TR-60-50.
Order from LC mi$3.60, ph$9.30 PB 148 784

An improved estimate of short-term memory for visual displays was obtained by giving a signal subsequent to the presentation that selects the element of the display on which the subject is to report. Papers prepared and brief summaries of each item on the contract are also listed.

Research Center for Group Dynamics, U. of Michigan, Ann Arbor.
STUDIES IN SELECTION LEARNING. II. THE EFFECT OF INFORMATIVE AND UNINFORMATIVE CUES ON THE ACQUISITION AND RETENTION OF INTENTIONAL ITEMS, by Eugene Burnstein. Technical rept. no. 2 on Contract AF 49(638)367 and National Science Foundation Grant G-4951. Oct 59, 12p. 7 refs. AFOSR-TN-60-263; AD-231 032.
Order from LC mi$2.40, ph$3.30 PB 146 311

The purpose of this study was to examine the effect of the informativeness of the selection cue on acquisition and retention under conditions of selection learning. In selection learning, unlike ordinary verbal rote learning, subjects learn a set of items which are interspersed among incidental items to be ignored. The selection cue differentiates between the intentional and incidental items. The findings indicate a significant effect in memory deriving from the informativeness of the selection cue. In the informative condition the intentional items consisted of two odd and one even digit numbers and the incidental items of three even digit numbers and subjects were instructed to learn only the former. In the uninformative condition both sets of items were the same but the intentional items were preceded by three taps and incidental by two taps, and subjects were instructed to learn only those preceded by three taps. No mention of the digital composition of the items was made. The findings show that when the cue is uninformative, performance in acquisition and retention is the same as in ordinary verbal rote learning. With informative cues, however, a significant gain in recall is obtained. (Author)(PB 145 101)

Research Center for Group Dynamics, U. of Michigan, Ann Arbor.
STUDIES IN SELECTION LEARNING. III. FACILITATION AND INTERFERENCE EFFECTS IN SELECTION LEARNING, by Eugene Burnstein. Technical rept. no. 3 on Contract AF 49(638)367 and National Science Foundation Grant G-4951. Oct 59, 19p. 2 refs. AFOSR-TN-60-264; AD-233 378.
Order from LC mi$2.40, ph$3.30 PB 146 310

Two experiments were conducted to demonstrate directly facilitation and interference effects in selection learning. The selection learning paradigm involves the simultaneous presentation of intentional and incidental items with the requirement that the subject learn only the intentional ones. In experiment 1 an attempt was made to improve the performance of selection learners in acquisition by reducing interference without simultaneously also reducing facilitation. Informative cue selection learners were compared for acquisition rates with uninformative cue selection learners, and the results demonstrated superior acquisition rate for the former. In experiment 2 an attempt was made to reduce acquisition rates of the selection learners by requiring short response latencies. The results showed clear superiority of rote learners over selection learners in acquisition. In retention test some evidence for the differential dissipation of interference effects was obtained. Most forgetting was obtained for rote learners, next for selection learners with uniformative cues, and least for selection learners with informative cues. (Author) (See also PB 146 311)

Research Center for Group Dynamics, U. of Michigan, Ann Arbor.
STUDIES ON DRIVE AND INCENTIVE IN PERCEPTION. I. SOME EFFECTS OF DRIVE ON STIMULUS GENERALIZATION, by Donald Dorfman. Technical rept. no. 5 on Contract AF 49(638)367 and National Sciences Foundation Grant G-4951. Feb 60, 18p. 26 refs. AFOSR-TN-60-326; AD-233 777.
Order from LC mi$2.40, ph$3.30 PB 146 641

Some implications of the hypothesis that the effective or perceived intensity of a stimulus is an increasing function of drive level were tested. Implications were derived for stimulus-generalization data. The experimental results confirmed the hypothesis: (1) an increase in drive level from training to test resulted in a shift of the generalization gradient toward the lesser physical stimulus intensities; and (2) a decrease in drive level from training to test resulted in a shift of the generalization gradient toward the greater physical stimulus intensities.

Rutgers State U., New Brunswick, N. J.
THE SENSITIVITY OF EMPLOYEE ATTITUDE QUESTIONNAIRES, by F. K. Berrien and William H. Angoff. Technical rept. no. 5 on Contract Nonr-404(10). Sep 59, 47p. AD-226 671.
Order from LC mi$3.30, ph$7.80 PB 148 596

Two industrial plants, M and C, under the same management, doing identical work but separated by several hundred miles, were surveyed by an attitude questionnaire on two occasions separated by three and a half months. Just before the second survey in Plant C, employees were informed that the plant would be moved to a distant location in the near future. Interviews with employees, supplementing the questionnaires, confirmed the expectation that attitudes toward the company were adversely affected by the announced plans. However, the adverse attitudes, as expressed on the questionnaire, "scapegoated" supervisors whose behavior had not actually changed as evidenced by other questions. No similar changes occurred in the control plant. Because the majority of the questions did not show important changes in item values between Time 1 and 2, and because the observed changes appeared in far greater number in only one shift of Plant C, it is suggested that questionnaires of this type may be less sensitive than sometimes supposed. The usefulness of such questionnaires as research or management tools in assessing changes less drastic than the one described herein may be questioned. (Author)

SOME ATTEMPTS TO MEASURE TOLERANCE FOR DISSONANCE, by Elliot Aronson and Leon Festinger. Technical rept. on Contract AF 41(657)140. Dec 58, 18p. WADC-TR-58-492; AD-207 337.
Order from LC mi$2.40, ph$3.30 PB 149 286

Individuals differ in their ability to tolerate cognitive dissonance introduced in laboratory experiments. The research reported in this paper was an attempt to develop a measure of tolerance for dissonance. Five tests were developed, four of which were administered to the predetermined criterion groups. None of these

effectively discriminated between subjects whose behavior indicated a high tolerance for dissonance from those whose behavior indicated low tolerance for dissonance. A different approach to a criterion was tried by identifying a group that had demonstrated high tolerance in a real-life situation. These were students who had changed majors in their junior year of college. A personality inventory was constructed and administered to ex-engineering majors and to a control group of engineering majors. Substantial differences in responses appeared in six areas. The general effectiveness of the questionnaire as a measure of tolerance for dissonance must be tested by administration to other groups that have recently made an important life decision, such as changing occupation or religion. THE EFFECT OF ELECTROCONVULSIVE SHOCK ON MALE ALBINO RATS WITH EXPERIMENTALLY INDUCED SENSORY DEFICITS, by David G. McDonald. Progress rept. on Contract Nonr-816(06). 30 June 59, 26p. AD-225 308.
Order from LC mi$2.70, ph$4.80 PB 146 688

A test was made of the hypothesis that a series of electroconvulsive shocks (ECS) produce an increase in reactivity to a variety of environmental stimuli in the male albino rat. Groups of blind, deaf, and anosmic animals were produced. After allowing sufficient time for recovery, one-half of the animals in each group received a series of 15 ECS, the other half 15 pseudo-ECS, one per day for 15 days. All animals were then trained in an enclosed alley straightaway, one trial per day for 20 days. Data indicated that a series of ECS results in significant differences in behavior, caused by a general increase in reactivity to environmental stimuli. (See also PB 144 182)

DIMENSIONAL ANALYSIS, LATENT STRUCTURE, AND THE PROBLEM OF PATTERNS, by Clifford E. Lunneborg, Jr. Rept. on Contract Nonr-477(08) and Public Health Research Grant M-743(C4). Sep 59, 89p. 31 refs. AD-226 073.
Order from LC mi$4.80, ph$13.80 PB 148 593

A development study is presented of a technique of analysis dependent upon the configural dimensionality of a set of psychological measures. The problem of patterns arises from the criticism of traditional test scoring procedures that linearly combining item or test responses results in a loss of information inherent in the patterning or configuration of the responses. If pattern information is present for a set of measures over a sample of respondents, then, in terms of the general polynomial formulation, the higher order power and product terms should provide sources of variation independent of the variation possessed by the original measures. This proposition was recast in a form suitable to test by techniques conventionally associated with factor analysis. This new proposition was that the rank of a matrix of observations on a set of psychological measures augmented by higher order power and product terms should be greater than the rank of the matrix of observations on the original variables considered by themselves if any pattern information is present in those observations. The present technique and the problem of pattern analysis is compared with the technique of latent class analysis. The latter is shown to be a form of pattern analysis restricted to somewhat homogeneous sets of measures. (Author)

COLD TESTING OF SELECTED COMPONENTS OF ECL-20-92-28-36-BED AIR TRANSPORTABLE INFIRMARY, by Charles L. Lecker. Jan 58, 20p. Technical note AAL-TN-58-31; AD-221 552.
Order from LC mi$2.40, ph$3.30 PB 146 628

Cold testing of selected components from a 36-bed air transportable infirmary was conducted at Ladd Air Force Base, Alaska to determine serviceability and operational capability at sub-zero temperatures. The tests were conducted in a squad tent which was a component of the 36-bed assemblage. During a typical 8 hr test period the tent interior displayed floor temperatures between -22°F. to +24°F. in areas remote from the heat source and temperatures between -12°F. to +62°F. in an area near the heat source. Pre-and post-exposure control tests were conducted indoors at a temperature of approximately 70°F. During the cold testing of items other than the tent, the outside temperatures ranged from -28°F. to 35°F. The tent was erected at a temperature of 10°F. with approximately 8 inches of snow cover. The wind velocity ranged from zero to 2 miles per hour. All components were given a rough treatment test as well. (Author)

BREATHING IN BRIEF EXERCISE, by F. N. Craig and E. G. Cummings. Apr 60, 22p. 13 refs. CWLR-2364.
Order from LC mi$2.70, ph$4.80 PB 148 265

Ventilation of the lungs before, during, and after running on the treadmill for periods of 20 and 60 seconds has been observed in two men. Speed and grade were varied and mixtures of air, oxygen, and carbon dioxide were inhaled. Oxygen consumption, carbon dioxide output, and the concentration of carbon dioxide in respired air were also observed. In the first 20 seconds of the run, the ventilation varied with speed but was not necessarily proportional to the ultimate metabolic cost of the run. (Author)

ESTIMATION OF PULMONARY RESISTANCE BY REPETITIVE INTERRUPTION OF AIR FLOW, by John A. Clements, John T. Sharp and others. Oct 59, 31p. 13 refs. CWL Special pub. 2-24.
Order from LC mi$3.00, ph$6.30 PB 146 345

A simple technique for estimation of lung and airway resistance has been developed, using repetitive interruption of air flow and non-linear flowmetering. The method is satisfactory with respect to reproducibility of values and is a valid method for measuring resistance, as judged by comparison with standard methods. The theory of the method has been briefly explored, with special attention to the influence of the thorax and effect of upper airway properties. The physical properties of the thorax cause slight overestimation of resistance and this effect is increased at the extremes of lung volume. The effect of upper airway properties is to cause underestimation of resistance; this effect is accentuated by increased distensibility of upper airways, especially when pulmonary resistance is high. It is concluded from resistance measurements on human subjects and from studies on respiratory analogs that the inherent error of the method ranges from about +0.2 cm H_2O/1/sec in the normal to about -1.5 cm H_2O/1/sec at 15 cm H_2O/1/sec. It is pointed out that the method may develop larger errors in inhomogeneous obstructive pulmonary disease.

HIGH G PROTECTION, by R. F. Gray and M. G. Webb. Rept. on Proj. TED ADC AE 1411. 12 Feb 60, 22p. 10 refs. Rept. no. 7 on Task MR005.12-0007.2; NADC MA-5910; AD-235 338.
Order from LC mi$2.70, ph$4.80 PB 146 960

The advantages, problems, and limits of older types of G protective systems are discussed in this report. Theories are presented for methods of using liquid or form-fitting external supports for the body along with respiratory pressurization to counteract the distorting forces. Actual devices which were worked out to apply these theories are shown. These devices include: (a) the Mayo Tank first used in 1942 to test G protection by submersion in water; (b) the G-Capsule and associated equipment; and (c) the Moulded Couch incorporating several devices or procedures such as partial supination to avoid chest pain. Through the use of these various devices during the past year, several new records of tolerance to centrifugal acceleration have been established, indications have been gained for improvements on these devices, and it is expected that higher levels of G tolerance will be attained. (Author)

A COMPARISON OF THE RECEIVER OPERATING CHARACTERISTICS FOR MESSAGES RECEIVED BY EAR AND BY EYE, by Edward C. Carterette and Michael Cole. Technical rept. no. 2 on Contract Nonr-233(58). 18 June 59, 24p. 15 refs. AD-225 060.
Order from LC mi$2.70, ph$4.80 PB 146 695

The following questions were investigated: (1) are the auditory and visual receiver operating characteristic curves different; and (2) does the assumption of a constant probability of correct recognition over successive presentations hold up as a good engineering approximation for vision? Visual and auditory experiments indicated a remarkable similarity in the form of the response whether the messages were spoken over a noisy communication channel or presented for a brief duration in a tachistoscope.

Copenhagen U. (Denmark).
AN INVESTIGATION OF THE EFFECTS OF CAUDATE PROJECTIONS TO CEREBRAL CORTEX, by A. Mosfeldt Laursen. Final technical rept. for 1 1 Nov 58-31 Oct 59 on Contract DA 91-591-EUC-943. 30 Nov 59, 20p. 20 refs. AD-231 380.
Order from LC mi$2.70, ph$4.80 PB 146 307

The influence on cortical electrical activity exerted by the caudate nucleus was tested and a search was conducted for electrical responses in this nucleus when the cerebral cortex was stimulated electrically. Strong single pulses delivered to the caudate evoked a potential whose source was found to be the caudate nucleus itself, and which could be recorded on the cortical surface. There was no evidence of potentials generated in the cortex when the caudate nucleus was stimulated. The dorsolateral surface of the hemispheres was explored with a stimulating electrode using a wide range of stimulus parameters, while attempts were made to detect an electrical response in the caudate. It was found that the caudate could not be considered a relay for the unspecific thalamic projections to the cortex, and there is consequently no evidence to indicate that the function of the caudate is directly connected with that of the reticular activating system of Moruzzi and Magoun.

Lamont Geological Observatory, Palisades, N. Y.
THE RELATIONSHIP OF REPRODUCTIVE TEMPERATURE AND THE GEOGRAPHICAL RANGE OF THE MARINE WOODBORER LIMNORIA TRIPUNCTATA, by Carolyn Beckman and Robert Menzies. Technical rept. no. 2 on Contract Nonr-266(41). Sep 59, 20p. 8 refs. CU-3-59-Nonr 266(41); AD-228 561.
Order from LC mi$2.70, ph$4.80 PB 148 598

Experimental results show that Limnoria tripunctata will feed at temperatures ranging from approximately 10°C to 30°C. The reproductive temperature range appears to be from about 15°C to 30°C and the greatest population increase is in the neighborhood of 25°C. Excessive mortality results at 30°C. Gravidity and hence number of young produced depends upon the season and does not appear to be immediately modified by the presence of favorable reproductive temperatures. The experimental results agree well with the known geographic range of the species. (Author)

THE DEVELOPMENT OF A TEST TO DETERMINE THE ADEQUACY OF DECOMPRESSION FOLLOWING A DIVE, by R. J. Kiessling and G. J. Duffner. 15 Feb 60, 23p. 16 refs. Research rept. 2-60; AD-234 889.
Order from LC mi$2.70, ph$4.80 PB 146 958

An attempt was made to develop a test of decompression adequacy which can be used both as a research technique and to evaluate new decompression procedures and devices for diver and underwater swimmer. Eighteen subjects made 30-min air dives of 90, 110, and 125 ft. After a surface interval of 45 min the divers were further decompressed to 18,000 ft of altitude for 1 hr. Times of occurrence of decompression sickness symptoms were utilized as measurements of decompression adequacy. The test devised proved to predict decompression adequacy following no-decompression dives. (Author)

CHANGES IN BODY TEMPERATURE AND RENAL FUNCTION IN DOGS EXPOSED TO COLD, by W. C. Nungesser and H. E. Ederstrom. Rept. on Contract AF 18(600)1136. Nov 57, 35p. 8 refs. Technical note AAL-TN-57-38; AD-221 548.
Order from LC mi$3.00, ph$6.30 PB 146 619

Methods for the study of renal function in the dog in cold, and to correlate any observed changes with other physiological variables known to occur in cold were investigated. Methods employed are described. Subsequent experiments duplicating the coldroom experiments but without cold were run on the same animals. Changes in renal functions studied were variable in the unanesthetized dog in the cold. No changes were seen which were different in magnitude or direction than might occur with time alone. Changes in skin temperatures, shivering, and other variables in these and previous experiments are discussed.

Technische Hochschule, Munich (West Germany).
INVESTIGATION OF THE POSSIBLE INFLUENCE OF ATMOSPHERIC IONS ON HUMAN REACTION TIME, by Joseph Eichmeier and John Rheinstein. Final technical rept. for 1 Jan-31 Dec 59 on Contract DA 91-591-EUC-1035. [1959] 52p. 173 refs. AD-232 720.
Order from LC mi$3.60, ph$9.30 PB 146 309

Ions must be breathed in through the mouth in order to affect human push button reaction time. Different concentrations of atmospheric ions have different effects upon reaction time. Concentrations within an order of magnitude of those found in nature are found to have an effect on the reaction time. It is improbable that the electric field of an ion generator has any large effect on reaction time. The possibilities of the elimination of atmospheric small ions in a sealed room are examined. The most appropriate electrical means of making a sealed room free of ions is by using 2 opposite walls of the room as electrodes of a condenser. The applied field should be of the order of 30 V/cm. Ion densities as low as 50 positive and 100 negative ions/cm^3 have been obtained in a wire cage. Methods are discussed for reducing the influence of the undesirable part of the electric field of the measuring condenser.

THE AUTOMATIC DETERMINATION OF CALCIUM, INORGANIC PHOSPHATE, UREA NITROGEN, AND GLUCOSE IN PAROTID FLUID, by Ira L. Shannon and John R. Prigmore. Apr 60, 17p. 49 refs. Rept. 60-49.
Order from LC mi$2.40, ph$3.30 PB 148 084

Automatic methods of chemical analysis have been adapted to parotid fluid analysis and the performance of these procedures has been evaluated in the determination of calcium, inorganic phosphate, urea nitrogen, and glucose.

School of Aviation Medicine, Brooks AFB, Tex.
PAROTID GLAND FLOW RATE AND PAROTID FLUID UREA CONCENTRATION, by Ira L. Shannon and John R. Prigmore. June 60, 7p. 7 refs. Rept. no. 60-59.
Order from LC mi$1.80, ph$1.80 PB 148 498

In a series of three experiments the relationship between parotid gland flow rate and parotid fluid urea concentration was determined. In each instance a significant ($P < .01$) negative correlation was found between these two variables. The data were all combined and an average within-subjects correlation coefficient of - 83 ($P < .01$) was calculated. The average between-subjects correlation coefficient of .05 was not significantly different from zero. In a fourth experiment parotid flow was elicited continuously for three hours in 11 subjects. The effect of time on flow rate and urea concentration was insignificant; that is, there was no apparent gland fatigue effect on either variable during the three-hour period. (Author)

OXIDATIVE PHOSPHORYLATION IN LIVER MITOCHONDRIA PREPARED FROM COLD-EXPOSED RATS, by Sylvia Panagos, Robert E. Beyer, and Edward J. Masoro. Rept. on Contract AF 41(657)145. June 58, 5p. 4 refs. Technical note AAL-TN-58-32; AD-221 553.
Order from LC mi$1.80, ph$1.80 PB 146 627

The mechanism of increased heat production in animals exposed to cold for 2 or more wk was explained in the following manner: On a decrease in the formation of ATP coupled to electron transport, a larger proportion of the available energy derived directly from this system would be evolved as heat. This increased heat production may in part contribute to the maintenance of body temperature in the cold environment. The necessity of the thyroid and adrenal secretions for continued survival in the cold may indicate an hormonal influence on these energy-producing reactions of the body.

BIOPHYSICAL AND BIOCHEMICAL STUDIES ON VIRUS INFECTED CELLS, by Pierre Lepine. Final technical rept. no. 1, 1 Mar 59-29 Feb 60, on Contract DA 91-591-EUC-1069. 29 Feb 60, 15p. 7 refs. AD-234 913.
Order from LC mi$2.40, ph$3.30 PB 146 955

Preliminary infection of a given mammalian cell system, by a virus whose virulence is maintained at such a low grade that it will not destroy the infected cells but simply cause a chronic infection, is capable of completely suppressing the multiplication of another virus, though highly virulent, when added as a secondary infecting agent in the given cell system, notwithstanding the fact that there is no antigen relation or cross-immunity between the two viruses involved in the process. This inhibition phenomenon bears on the phase of multiplication of the second infecting virus, this virus being fixed by the preliminary infected cells in the same amount and in the same conditions as it is fixed on normal control cells. This inhibitory phenomenon is governed by the production of a substance of a protein nature in the infected cells which is capable of inhibiting the growth of the virus and which can be transferred from an infected system to a non infected one, thus inducing in normal non infected cells an acquired resistance to virus infection. The study of syncytial formations under the influence of a Myxovirus in chronically infected cell systems lead to the conclusion that such formations are governed by the presence of a cell secreted substance which was named syncytin and which induces the formation of such syncytia by dissolving the limiting membrane in infected cell aggregates. VIRULENCE OF ROCKY MOUNTAIN SPOTTED FEVER, by Winston H. Price. Final progress rept. on Contract Nonr-248(44). 30 June 58, 41p. 8 refs.
Order from LC mi$3.30, ph$7.80 PB 148 928

Three virulent types of R. rickettsii exist in the United States, which can be differentiated by the symptoms they produce in guinea pigs. In their arthropod vector, D andersoni, each type may assume an intermediate virulent phase, lower in virulence than the virulent type from which it arose. All three virulent types can pass into an avirulent phase, which is of much lower virulence than the intermediate virulent phase. The two low virulent phases are not genotypic changes, but are only changes in phenotype. A substance can be shown to be present in appropriately prepared tick suspensions which lowers the virulence of the virulent phase when incubated with such rickettsiae in vitro. The virulence of both phases can be increased by diphosphopyridine nucleotide (DPN) or by appropriately prepared tick extracts. The avirulent phase is characterized by being virulent for chick embryos but not for guinea pigs; it immunizes guinea pigs against the virulent phase of any one of the three types, but not against boutonneuse fever, and can not be recovered from guinea pigs. In vitro reactivation experiments indicate that the increase in virulence from the avirulent phase to the virulent phase occurs in two and possibly 3 steps, although the same compounds appear to be involved in each reactivation step. All data indicate that the changes of R. rickettsii from high to low virulence phases to avirulent phases and back to high virulence are not due to selection, mutation, or a combination of these phenomena but to actual changes in the majority of the rickettsiae. The low virulent phases have so far only been produced in arthropod vectors or in vitro by the addition of tick extracts. Two very low virulent types of R. rickettsii, U_1 and U_2, exist in the United States. All data fits with the theory that the arthropod can control the virulence of R. Rickettsiae by controlling the synthesis of specific compounds. Although the avirulent phase of all virulent types can be readily isolated in nature, there is no evidence that these changes in virulence play a role in selecting new types of virulent strains in nature.

CONTINUOUS EXPOSURE OF LABORATORY ANIMALS TO A LOW CONCENTRATION OF CARBON MONOXIDE, by Nelson P. Musselman, William A. Groff and others. Jan 60, 11p. 23 refs. CWLR-2337; AD-232 115.
Order from LC mi$2.40, ph$3.30 PB 146 302

The effects on dogs, rabbits, and rats of continuous exposure (24 hr a day, 7 days a wk) to a low concentration (50 ppm) of carbon monoxide (CO) was studied. Three weeks after initial exposure, the hemoglobin, hematocrit, and red blood cell (RBC) counts of the dogs showed slight increases, which persisted throughout the remainder of the tests. The average per cent saturation of hemoglobin by CO was 7.3 for dogs 3.2 for rabbits, and 1.8 for rats. Except for a small increase in the eosinophil count of the rats, no other blood changes were found. All tissues examined microscopically and macroscopically appeared similar to those of the controls. The exposed animals showed no significant differences as compared with the control animals in voluntary activity, behavior, body weight, ratio of heart weight to body weight, and electrocardiograms (EKG). The absence of toxic signs and only slight blood changes in the dogs, rabbits, and rats used in the experiments indicate that no harmful effects result fron continuous exposure of these animals to a concentration of 50 ppm of CO. CHEMICAL FACTORS AFFECTING THE PHYSIOLOGY AND PATHOLOGY OF NERVOUS FUNCTION, by David Nachmansohn. Final rept. Aug 54-Aug 58, on Contract DA 49-007-MD-740. Apr 58, 10p. 24 refs. AD-218 028.
Order from LC mi$1.80, ph$1.80 PB 148 383

Development of an antidote against nerve gas poisoning: Experiments are described in which 2-pyridine aldoxime methiodide (2-PAM) was successfully used on mice to prevent paraoxan poisoning and on human beings to treat patients poisoned with parathion, an insecticide. 2-PAM was considered a really efficient antidote. Atropine combined with PAM protected animals against 15- to 20-fold lethal doses (and more) of alkylphosphate. The combination proved even sucessful against poisoning with sarin. 2-PAM was found to exert the extraordinary power of reactivation only in the case of phosphorylated acetylcholinesterase.
Lipid soluble quaternary ammonium ions: The action of lipid soluble quaternary ammonium ions in the conducting membrane is discussed. Many possibilities for the study of the chemical mechanism underlying nerve activity are offered by modifying molecules in such a way that they produce predictable and desired effects.

A COMPUTER SOLUTION FOR DETERMINATION OF THERMAL TISSUE DAMAGE INTEGRALS FROM EXPERIMENTAL DATA, by Alice M. Stoll. 9 Mar 60, 16p. 5 refs. Rept. no. 17 on Task MR 005.15-2002.1; NADC MA-6004; AD-234 709.
Order from LC mi$2.40, ph$3.30 PB 146 959

A computer method utilizing the IBM 650 and the Bell Telephone programming system was developed for the evaluation of tissue damage due to thermal irradiation. It is presented as an illustration of the possibilities computers offer the biological investigator unversed in their use. It was possible to obtain a complete analysis, yielding separate values of damage during heating, damage during cooling, and total damage, within 45 sec or less, of machine time for each set of data. In contrast, graphical integration by a skilled operator required at least a half-hour for each set. Since hundreds of such analyses may be required in this type of study, the advantages of computer use are obvious. Furthermore, the relative simplicity of the programming system is such that very little training or mathematical skill is required for the biological investigator to be able to prepare his own computer programs and thereby eliminate many tedious and time-consuming graphical procedures. EFFECT OF X-IRRADIATION ON SPLEEN NUCLEOTIDE LEVELS, by Edwin M. Uyeki. Apr 60, 11p. 10 refs. AFSAM rept. 60-28.
Order from LC mi$2.40, ph$3.30 PB 148 083

A study was made of the effects of whole-body x-irradiation on the adenosine nucleotide levels of the spleens of rats, mice, and guinea pigs. At various intervals after the animals were exposed to 400 and 800 r of x-ray, they were sacrificed and measurements taken of the adenosine triphosphate, adenosine diphosphate, and adenylic acid levels. A lethal dose of x-ray (800 r) caused a decrease in the ATP levels of rat spleen to 63 percent below normal and a reduction in the total nucleotide content of the spleen. A 50 percent decrease in the adenosine triphosphate levels of the spleens of mice was observed with 400 r of x-ray and after 800 r a progressive and continuous decline in this nucleotide occurred during the survival period. The adenosine triphosphate levels of guinea pig spleens decreased more slowly and to a lesser extent than such levels in the spleens of rats and mice. The radiation-induced decreases in adenosine triphosphate content of the spleens of these three species may be explainable on the basis of an increased adenosine triphosphatase activity which was previously observed in this laboratory to be caused by ionizing radiations. The nature of the biologic test system (viz, growing cells) restricts a causal association between the nucleotide titers and phosphatase activity. (Author)

MOLECULAR RESPONSE CHARACTERISTICS TO ULTRA-HIGH FREQUENCY FIELDS, by Herman P. Schwan. Technical rept. no. 24 on [Contract Nonr-551(05)] [1959] 26p.
Order from LC mi$2.70, ph$4.80 PB 148 160

It is concluded from available information that effects of orientation may definitely exist at levels of organization down to about one micron, and breakage of molecular bonds may occur under pulsed conditions involving high field values and at the lower end of the radar frequency range.

Moore School of Electrical Engineering, U. of Pennsylvania, Philadelphia.
SURVEY OF MICROWAVE ABSORPTION CHARACTERISTICS OF BODY TISSUES, by Herman P. Schwan. Technical rept. no. 25 on Contract [Nonr-551(05)]. [1959] 33p
Order from LC mi$3.00, ph$6.30 PB 148 161

The absorption data reviewed cover a total range of about 1 to 10 at any particular frequency. The determination of absorption characteristics is a prerequisite to much experimental work. For most tissues frequencies substantially higher than 3,000 Mc cause mere surface heating, i.e. they act like infrared or sunlight. At lower frequencies, particularly below 1,000 Mc, much larger penetration is achieved. From the complexity of reflectance and energy distribution it is concluded that no dose meter can be constructed which can be carried on or near the body surface and give sensible data. Standing wave pattern in the body makes it senseless to talk about energy flux in the body and to use it as a measure of dosage.

RADIOPROTECTION OF FEMALE RATS WITH AET, by George S. Melville, Jr. and Thomas P. Leffingwell. May 60, 14p. 19 refs. AFSAM rept. no. 60-40.
Order from LC mi$2.40, ph$3.30 PB 148 497

The protective effect of S, 2-aminoethylisothiuronium dibromide (AET) against the injury caused by gamma rays has been studied in the female rat. Significant protection has been achieved using either intraperitoneal injection or gavage. The drug was somewhat more effective when given by the parenteral rather than by the oral route. It was also noted that as the dose rate was decreased from approximately 1,000 to 500 to 100 r per minute, the protective effect of oral treatment with AET was also decreased. Further evidence suggests that larger animals are more susceptible to the toxic effects of the protective drug itself. (Author)

NEUTRON ACTIVATION OF BIOLOGIC MATERIALS: NEUTRON EXPOSURE FACILITY, by David R. Rovner. Feb 60, 9p. 10 refs. Rept. 60-18.
Order from LC mi$1.80, ph$1.80 PB 148 082

A facility for exposing biologic materials to neutrons of varying energies is described. The primary source is a linear accelerator which utilizes: (1) a 100 kv. potential to accelerate deuterium ions; and (2) targets consisting of both deuterium and tritium types. Calibration of the monitoring equipment and operating controls is discussed. The dosimetry of the neutron field is explained and doses at various points are calculated. The maximum flux available is 1.0×10^9 neutrons per second, representing a dose of 93 rep per hour at 4.5 cm. from the target. Measures for radiation safety are briefly described: these are in accord with the recommendations of the National Committee on Radiation Protection. (Author)

STUDY OF THE POST-IRRADIATION SYNDROME IN HUMANS, by James J. Nickson. Final rept. for 1 Nov 57-31 Oct 58 on Contract DA 49-007-MD-910. [1958] 26p. AD-211 306.
Order from LC mi$2.70, ph$4.80 PB 146 593

Four patients with nearly normal physiologic condition received five courses of total-body irradiation of calculated absorbed doses from 50 to 150 r at midplane, and one of the patients also received internal irradiation from sodium-24. Physiological alterations resulting from irradiation were studied. Alterations in the formed elements of the circulating blood were found to be the most consistent index of radiation effect. Data are included on changes in creatin-creatinine excretion ratios, pentose excretion rate, and properdin levels.

A PRELIMINARY INVESTIGATION OF THE APPLICATIONS OF MAGNETIC RESONANCE ABSORPTION SPECTROSCOPY TO THE STUDY OF THE EFFECTS OF MICROWAVES ON BIOLOGICAL MATERIALS, by George Pish, William H. Storey, Jr. and others. Rept. no. 12 (Final) for 9 May 58-1 May 59 on Contract AF 30(602)1843. 1 May 59, 95p. 9 refs. RADC-TR-59-81; AD-216 431.
Order from LC mi$5.40, ph$15.30 PB 147 024

Electron spin resonance (EPR) methods were found applicable to show changes induced by microwave radiation upon the eyes of rabbits. The EPR signals obtained from ionizing radiation induced free electrons in the posterior cortex tissue of the lens show a simple singlet structure with the differences between normal and opaque lenses giving a doublet structure. Also, observation of dilute solutions of lens tissue shows the effects of microwave damage. The free radicals induced in lenses exposed to microwave radiation have a longer life than those from normal lenses. Differences in protein structure between normal rabbit eye lenses and rabbit eye lenses in which cataracts have been induced by microwave irradiation were investigated by high resolution nuclear spin resonance (NSR). NSR spectra from the proteins in rabbit eye lenses are shown and are grossly interpreted. Differences in the NSR spectra between some of the cataract-bearing lenses and their non-cataract controls are pointed out, and the meanings of the differences are suggested. The effects of the presence of moisture on the action of trifluoroacetic acid on proteins is considered as a possible explanation for the time dependence of the data. In addition, a table is given showing the dry weights of the samples, together with weight loss upon drying.

RESEARCH ON LOCALIZED RADIO-LESIONS. PART V. OBSERVATIONS ON PIGEONS DECEREBRATED WITH HIGH ENERGY PROTONS, by Eric Fabricius and Börje Larsson (U. of Uppsala). Technical rept. no. 1, Appendix 3, on Contract AF 61(514)1247. 26p. 35 refs. AFOSR-TN-60-254; AD-233 374.
Order from LC mi$2.70, ph$4.80 PB 146 312

Four pigeons were decerebrated by radiolesions produced by 185 Mev protons from a synchrocyclotron. The cerebral preduncles were cut off at the level of the anterior commissure and the bending point of the

tractus septo-mesencephalicus. Escape response and spontaneous feeding and drinking disappeared in all the birds, as well as all social behavior, including calling, but the ability of walking, standing in a normal position, and maintaining the equilibrium remained. All birds lost the ability of passing food from the crop into the stomach. The method of producing lesions by a proton beam proved promising for functional studies on the bird brain. The lesions were distinctly restricted. No damage to surroundings structures, and no conditions of shock were observed. (Author) (See also PB 146 313)

SIGNIFICANCE OF ECHINOCOCCUS MULTILOCULARIS TO MILITARY PERSONNEL AT REMOTE STATIONS IN ALASKA, by Jack D. Douglas. June 59, 10p. 10 refs. Technical note AAL-TN-59-3; AD-233 844.
Order from LC mi$1.80, ph$1.80 PB 146 626

Results of this project and other studies which have been conducted in recent years indicate that no medical or surgical problem exists relative to hydatid disease in military personnel stationed on St. Lawrence Island and the coast of Alaska. The problem of prime importance, insofar as military personnel are concerned, is of a psychological nature. Early exploratory work and findings in the native population have given rise to considerable local concern which is transmitted to new arrivals, usually in a manner which is completely out of proportion to the true picture. This laboratory is presently compiling a resume of the recent findings on hydatid disease in Alaska, which will be disseminated to site personnel to help alleviate the psychological problem. Although a true medical or surgical problem does not exist at present, it remains a potential threat, and studies must be continued to clarify further the various aspects of hydatid disease in order that more concrete information relative to control, early detection, and treatment will be available should the problem arise. (Author)

Florida U., Gainesville.
CHAETOGNATHA FROM THE COASTAL WATERS OF THE SOUTHEASTERN ATLANTIC STATES AND THEIR VALUE AS INDICATOR ORGANISMS, by E. Lowe Pierce and Marvin L. Wass. Final rept. on Contract Nonr-580(05). June 59, 63p. 26 refs.
Order from LC mi$3.90, ph$10.80 PB 147 447

The Chaetognatha were studied in plankton samples collected during nine cruises of the Fish and Wildlife Service M/V T. N. Gill in the waters off the coast of the southeastern Atlantic States. Three genera and 12 species were identified in a total of 590 samples examined. Two kinds of water were present in the area, Carolinian Coastal water and Florida Current water. Although most species showed a gradation from one kind of water to the other it was possible to select a species (S. hispida) which had a high percentage of incidence in Carolinian type water. Its presence in the Florida Current would indicate mixing with inshore water. S. hexaptera, S. lyra and K. subtilis showed more than a 90% occurrence in Florida Current water. Their presence in Carolinian type water could be attributed to recent mixing with Florida Current water. Constant selection for the ability to withstand mixed water in this area undoubtedly accounts for the widespread distribution of several of the species collected.

Kansas U., Lawrence.
STUDIES IN GENE-ENVIRONMENT INTERACTIONS IN DDT-RESISTANCE AND RELATED CHARACTERS. II. A CONTRIBUTION TO THE STUDY AND CONTROL OF ENVIRONMENTALLY CAUSED FLUCTUATIONS OF SOME QUANTITATIVE CHARACTERS IN DROSOPHILA MELANGASTER, MEIGEN, by Robert R. Sokal and Heinz W. Neunes. Final rept. on Gene-Environment Interactions in DDT-Resistance and Related Characters, Contract Nonr-583(08). 30 Sep 59, 30p. 13 refs. AD-233 100.
Order from LC mi$2.70, ph$4.80 PB 148 571

Environmentally caused fluctuations in the length of the larval period from generation to generation, as have been observed by several authors in selection experiments with Drosophila melanogaster, were shown to be mainly an effect of uncontrollable difference among separate batches of medium. The length of the pupal period is not subject to these fluctuations. The original hypothesis that the fluctuations in larval period are due to variations of the microflora in the medium vials, could not be verified: rearing the flies aseptically did not reduce the fluctuations. Instead, changes in the chemical composition of Karo-syrup and molasses in our medium were demonstrated to be largely responsible for the fluctuations. By means of replacing these two components with sugar and salts, the fluctuations were satisfactorily reduced. (Author)

Pennsalt Chemicals Corp., Wyndmoor, Pa.
PROPERTIES AND THERMAL STABILITY OF POLYMERIC MONOAMMINEDICHLOROZINC (II), by Joseph Simkin and B. P. Block. Technical rept. no. 2 on Contract Nonr-2687(00). 1 Aug 59, 6p. 10 refs. AD-225 086.
Order from LC mi$1.80, ph$1.80 PB 148 132

Monoamminedichlorozinc (I) was prepared by heating $[Zn(NH_3)_2Cl_2]$ at 200°C to release NH_3. The NH_3 loss was rapid at first but gradually decreased to a constant rate, corresponding to a loss of 1 mole NH_3 per $ZnCl_2$. Analysis of the residue confirmed the empirical formula as $An(NH_3)Cl_2$. The product was an amber-colored, transparent, glassy solid at room temperature. It had no sharp melting point, but softened at 80° to 90°C and was transformed into syrup which remained viscous up to 110°C, and became very mobile at 200°C. I was insoluble in common organic solvents but formed clear solutions in dimethylformamide, aqueous NH_3, and mineral acids. Infrared spectra indicated the presence of absorption bands in the region of 1600 and 1300 cm^{-1}. X-ray examination showed the product to be amorphous. These properties indicated the polymeric molecular structure $(-Zn(NH_3)(Cl)Cl-)_x$, with x large in value. I was stored at 200° ± 5°C for 200 hr in air. There was an approximate weight loss of 0.3% per hr for the first 30 hr followed by a significant leveling off to about 0.03 wt -% per hr. Analysis of the residue showed that 0.1% NH_3 remained; the Zn content was unchanged; and there was a substantial drop in total chloride. These results showed that contrary to the literature (R. J. Kane, Ann. chim. et phys [2] 72:29, 1839), I is decomposed upon heating, the dominant reaction being: $2n(NH_3)Cl_2 \triangle 2nCl_2 + NH_3$. The NH_3 which was coordinated with $ZnCl_2$ in I exhibited only moderate resistance toward thermal removal.

Pennsalt Chemicals Corp., Wyndmoor, Pa.
THE REACTION OF HEXAMMINECOBALT (III) CHLORIDE WITH SODIUM CYANIDE, by B. P. Block. Technical rept. no. 4 on Contract Nonr-2687(00). 1 Aug 59, 4p. 3 refs. AD-225 088.
Order from LC mi$1.80, ph$1.80 PB 148 134

Hexamminecobalt (III) chloride was allowed to react with NaCN at 80°C to produce a precipitate of $[Co(NH_3)_6]$ $[Co(CN)_6]$ rather than $[Co(NH_3)(CN)_3]$. It was concluded that partially substituted cyanocobalt (III) ammines are more reactive toward substitution than $Co(NH_3)_6^{3+}$, and that substitution which starts on a given cobalt atom goes to completion. The reaction is more facile at higher temperatures.

Pennsalt Chemicals Corp., Wyndmoor, Pa.
THE THERMAL STABILITY OF METAL AMMINES. II. COBALT (II) AND COBALT(III) COMPOUNDS, by L. R. Ocone, J. R. Soulen, and B. P. Block. Technical rept. no. 6 on Contract Nonr-2687(00). 1 Aug 59, 14p. 11 refs. AD-225 419.
Order from LC mi$2.40, ph$3.30 PB 148 136

The thermogravimetric behavior of seven cobalt ammines has been examined in a nitrogen atmosphere. Chelation increases thermal stability with six-membered rings showing greater stability than five-membered rings in chelates of tetrahedral cobalt (II). In all cases examined the ammines of cobalt (III) began to lose weight well under 200°C. No significant difference was detected in the thermal response of the cis and trans forms of $[Co(NH_3)_4Cl_2]Cl$. (Author) (See also PB 148 133)

Pennsylvania U., Philadelphia.
RESEARCH ON A NEW CLASS OF INORGANIC MOLECULES CONSISTING BASICALLY OF SULFUR AND NITROGEN, by M. E. Cohen, R. A. Kent and others. Rept. on Contract AF 33(616)5444. Apr 60, 22p. 13 refs. WADD Technical rept. 60-169.
Order from OTS $0.75 PB 161 883

The silicon amines, $(C_6H_5)_3SiNH_2$, $(C_2H_5)_3SiNH_2$ and $[(CH_3)_3Si]_2NH$ have been found to react with either S_2Cl_2 or SCl_2. No pure silicon derivatives of tetrasulfur tetranitride, S_4N_4, of the type $(R_3Si)_4S_4N_4$, $(R_3Si)_3S_5N_2$, $(R_3SiNS)_x$ etc. analogous to those formed by carbon amines, could be isolated from the reaction products. NH_2CN, $CO(NH_2)_2$ and $CO(NHCH_3)_2$ were found to react with S_2Cl_2 to give complex polymeric materials. S_4N_4 was found to react violently with $C_6H_5PCl_2$ at room temperature to give high yields of the linear phenyl phosphonitrilic chloride oligomer, $(C_6H_5PNCl)_4 \cdot C_6H_5PCl_4$. S_4N_4 was found to react with anhydrous HBr and HF at room temperature, to produce, in the former case, a mixture of S_4N_3Br and NH_4Br. S_4N_3Cl has been found to react with a number of amines to give semi-solid viscous materials.

Richmond Research Lab., Stauffer Chemical Co., Calif.
INORGANIC POLYMERS PROGRAM, by A. J. Leffler and F. W. Breuer. Semi-annual technical rept. for 1 July 58-1 Jan 59 on Contract Nonr-2259(00). 18 Sep 59, 61p. 29 refs. AD-227 693.
Order from LC mi$3.90, ph$10.80 PB 148 594

The reactions of tris-trimethylsilylphosphine were further investigated, and their thermal decompositions yielded hexamethyldisilane plus an unknown liquid. Reaction with diphenyldichlorosilane yielded low-molecular-weight polymers. The reaction of halogenated nitriles and diborane yielded stable borazenes; the reaction with difunctional materials is under investigation. An attempt to prepare $[H(CF_2)_4CH_2]_3P$ by the reaction of $H(CF_2)_4CH_2I$ and $NaPH_2$ in liquid ammonia yielded $H(CF_2)_3CF = CH_2$. The reaction of perfluoroadipodinitrile with ammonia yielded a mixture of cyclic imidine and diamidine. Homopolymerization of cyclic perfluoroglutaroimidine was investigated. Special reaction conditions were studied which consistently produced a polymer different from the known highly cross linked species. The cross-linked homopolymer was attacked by amidines and ammonia giving rise to side reactions which may also occur with the copolymers. Mechanisms for both the homopolymerization of the cyclic glutaroimidine and its copolymerization with amidines was proposed. A modified polymerization method consisting of the reaction of perfluorobutyroamidine and perfluoroglutarodinitrile gave a more uniform polymer, but the properties were not satisfactory. This reaction will be studied by the preparation of low-molecular-weight analogs.

THE HYDRATES OF THE TETRA n-BUTYL AND TETRA i-AMYL QUATERNARY AMMONIUM SALTS, by Richard McMullan and G. A. Jeffrey. Technical note on Contract AF 49(638)456. June 59, 13p. 10 refs AFOSR-TN-59-475; AD-215 718.
Order from LC mi$2.40, ph$3.30 PB 146 527

The several prepared compounds are believed to be of the clathrate type, similar in general character to the gas hydrates. Actually, as shown, the compounds form several series.

Washington U., Seattle.
HALOGEN FLUOROSULFONATES $BrSO_3F$, $Br(SO_3F)$ AND $I(SO_3F)_3$; PREPARATION OF MERCURY(II), NITROSYL AND NITROSONIUM FLUOROSULFONATES FROM PEROXYDISULFURYL DIFLUORIDE [AND] SOME REACTIONS OF FLUORINE FLUOROSULFONATE: IODINE TRIFLUORIDE BISFLUOROSULFONATE, by George H. Cady and John E. Roberts (U. of Massachusetts). Technical rept. nos. 23-25 on Contract Nonr-477(16). 1959, 17p. 22 refs. AD-219 821.
Order from LC mi$2.40, ph$3.30 PB 148 138

Bromine (I) fluorosulfonate, bromine (III) fluorosulfonate and iodine (III) fluorosulfonate have been prepared by reacting peroxydisulfuryl difluoride with the appropriate halogen. These compounds have been characterized. Chlorine does not react with peroxydisulfuryl difluoride. Attempts to prepare lower fluorosulfonates of iodine have given inconsistent results. Peroxydisulfuryl difluoride reacts with nitric oxide to give nitrosyl fluorosulfonate and with mercury to give mercury (II) fluorosulfonate. With nitrogen dioxide an equimolar mixture of nitrosyl and nitronium fluorosulfonates is produced. The reaction products have been characterized. Fluorine fluorosulfonate reacts with sulfur dioxide to give pyrosulfuryl fluoride and with thionyl fluoride to give peroxydisulfuryl difluoride and thioryl tetrafluoride. With iodine, fluorine fluorosulfonate reacts to from iodine trifluoride bisfluorosulfonate, $IF_3(SO_3F)_2$. This new compound has been characterized. Chlorine does not react with fluorine fluorosulfonate. (Author)

SULFUR-NITROGEN SYSTEMS. I. POLYMERS FROM SULFAMIDE, by F. L. Scott and H. Q. Smith. Technical rept. no. 5 on Contract Nonr-2687(00). 1 Aug 59, 24p. 13 refs. AD-225 089.
Order from LC mi$2.70, ph$4.80 PB 148 135

Formaldehyde, sulfamide, and melamine were allowed to react under condensation conditions at a pH of 10 to yield white solids which were resistant to most solvents and had melting points ranging from 220° to 260°C. The IR spectra indicated a structure which resembled polymethylene polysulfamide. The polymers could be pressed into films on a Carver press at about 210°C and 11,000 lb. Polymerizations run at pH 7 yielded the same product as at pH 10, except in smaller yield. This suggested that the active moiety in the facile cross-linking prowess of sulfamide was the sulfamide ion. Further experiments revealed the condensation of sulfamide with formaldehyde, even in the presence of stoichiometric quantities of base was much more rapid than the rearrangement of sulfamide to imidodisulfamide. Variations in the quantities of the reactants which were used to produce the sulfamide-based polymers caused no pronounced effects on the thermal properties of the polymers.

THE CHEMISTRY OF PROXIMATE AZIDO- AND THIO- GROUPS, by Eugene Lieber. Final technical rept. for 1 Sep 59-15 Feb 60 on Contract DA 11-022-ORD-3221. Feb 60, 86p. 56 refs. OOR rept. 2497.1-C; AD-235 469.
Order from LC mi$4.80, ph$13.80 PB 148 532

The present investigation concerns the synthesis of 5 (carbon-carbon substituted)-1, 2, 3, 4-thiatriazoles, and the physical properties of these systems. The infrared absorption spectra of the initial diazothization products of a series of 4-substituted thiobenzhydrazides clearly show that these compounds are not open chain azides, and confirms some recent investigations showing that these products are 5(para-substituted)-phenyl-1, 2, 3, 4-thiatriazoles. The reaction of sodium thiobenzoylthioglycolates with sodium azide in aqueous solution has been investigated and is found to give good yields of 5(para-substituted)phenyl-1, 2, 3, 4-thiatriazoles, identical with those formed by the diazotization

of 4-substituted thiobenzhydrazides. A study of the infrared absorption spectra of 4-substituted thiobenzhydrazides and aliphatic thiohydrazides shows that there exists no thione-thio tautomerism in their solid state. The 5(para-substituted)phenyl-1, 2, 3, 4-thiatriazoles exhibit aromatic type absorption in the ultraviolet region. The 1, 2, 3, 4-thiatriazole nucleus is electron-withdrawing in nature. All of the 5(para-substituted)phenyl-1, 2, 3, 4-thiatriazolea decompose at their melting points with the formation of 4-substituted phenyl nitriles, sulfur and nitrogen gas. The 5-aliphatic-1, 2, 3, 4-thiatriazoles are unstable and decompose upon formation, even at zero degrees centigrade. (Author)

THE EPOXIDATION OF SOME ALLYLIC ALCOHOLS, by James English and M. L. Sassiver. (Doctoral thesis). Rept. on Contract AF 49(638)37. [1960] 23p. 30 refs. AFOSR TN-60-247; AD-233 601.
Order from LC mi$2.70, ph$4.80 PB 147 228

The composition of the mixtures of stereoisomers produced on epoxidation of a series of allylic alcohols ($RCHOHCH=CH_2$) has been determined.

INVESTIGATION OF INITIAL FREE RADICAL YIELDS IN ORGANIC COMPOUNDS SUBJECTED TO GAMMA RADIATION, by Randolph H. Bretton and Imre Zwiebel. Rept. for 1 July 57-30 June 59 on Contract AF 33(616)5239. Apr 60, 46p. 32 refs. WADD Technical rept. 60-127.
Order from OTS $1.25 PB 161 849

Satisfactory analytical and operational procedures for the use of DPPH (diphenylpicrylhydrazyl) as a scavenger in free radical yield determinations have been developed. These procedures are used to determine the free radical yields resulting from the irradiation of organic compounds in a Cobalt-60 gamma source. This report includes a summary and discussion of the radiochemical theory relating to the problem, followed by a literature survey on the specific project of the irradiation of alcohols. The theory underlying the use of scavengers is presented and the results of a detailed study of the specific scavenger DPPH, are given. Preliminary results for the irradiation of ethyl alcohol and acrylonitrile are presented. (Author)

THERMOELECTRIC MATERIALS AND DEVICE RESEARCH, by B. R. Gossick and H. B. Whitehurst. Quarterly progress rept. no. 1, 18 Sep-17 Dec 59, on Contract DA 36-039-sc-85249. [1960] 17p. 6 refs. AD-232 816.
Order from LC mi$2.40, ph$3.30 PB 148 342

Previous knowledge concerning the thermal and electrical properties of rutile which would make it useful as a thermoelectric material is briefly discussed. A modification of the material which might improve the thermoelectric figure of merit is proposed. Experimental efforts to produce rutile in a suitable form by the treatment of colloidal precipitates is described. (Author)

RATES OF SELECTED REACTIONS INVOLVING NITROGEN AND OXYGEN, by Norman Davidson. Rept. on Contract AF 04(645)18. June 58, 16p. 24 refs. Research rept. 32; AD-205 514.
Order from LC mi$2.40, ph$3.30 PB 147 397

This report summarizes the results of kinetic studies of reactions other than dissociation involving compounds of nitrogen and oxygen. Not all of the extensive literature in the field is reviewed here. Attention is focused on those papers which, so far as the author knows, provide the best data. Kinetic studies with the single pulse shock tube are described in detail, because this new method is of particular interest for high temperature gas dynamics.

VARIATIONAL THEORY OF CHEMICAL REACTION RATES APPLIED TO THREE-BODY RECOMBINATION, by James Keck. Rept. on Contract DA 19-020-ORD-4862. Sep 59, 67p. 19 refs. Research rept. 66; AD-227 520.
Order from LC mi$3.90, ph$10.80 PB 147 208

A variational theory which gives a least upper bound to the rate of a chemical reaction is presented. Explicit calculations of the recombination rate of attracting atoms in the presence of repulsive third bodies are made for a simple trial surface having one adjustable parameter. At low temperatures, the experimental rate constants are quite close to the theoretical bounds; at high temperatures, the experimental data fall away.
